Another of my angling friends, whom I must not omit to mention is John W. Nicholson. He was born in Ireland, but has for many years been a merchant in the city of St. John. He has caught salmon in Ireland, Canada, New Brunswick and Nova Scotia, and in his skill for throwing the fly as well as making them I have never known his equal. And it may also be said of him that he has done more to facilitate the desires of anglers, when going north from Yankee land, than any other man. By his kindness in every way, and especially by his warm-hearted hospitality and a wonderful fund of fish stories, he has won devoted friends almost without number. His favorite river has always been the Nepisquit, of which he has for many years had the exclusive control.

Parting company with the Atlantic salmon, I desire to put upon record the list of streams within the limits of the New England States, in which they were formerly found, as follows: Aroostook, Saint Croix, Denny's River, East Machias, and Pleasant Point, in Maine; Connecticut River, Merrimack, Union, Penobscot, Saint George, Medford, Sheepscot, Kennebec, Androscoggin, Royals River, Presumpscot, Saco, Mousam, Piscataqua, Merrimack, Pawtuxet, Thames, Quinnipiac, Shetucket, Connecticut, Quinipiac and Housatonic. With perhaps some half dozen exceptions the salmon is to-day almost unknown in all these streams, and so long as their names are remembered will there remain a noble relic of the scientific language which simply overwhelms the ordinary intellect, we may say that there is really only one species of salmon on the Pacific coast, but there are many varieties. The most important of all the Western fishes is called the California salmon, or *Salmo gairdneri*; they are found in all the important rivers, but particularly numerous in the Columbia, which they ascend in April, and where, ever since they were noticed by Lewis and Clark in 1807, they have been highly valued by the white people and Indians as well. That they were the fly under favorable circumstances, has been fully substantiated; and they generally attain much greater size than is common with the Atlantic salmon.

In the preceding pages my comments have had sole reference to my personal acquaintance and friend, the common salmon or *Salmo salar* of the North Atlantic Ocean; but as our scientific explorers have recently brought to light much new information bearing upon the salmon of the Pacific Ocean, I shall now briefly synopses of their revelations. Leaving out of view altogether the scientific language which simply overwhelms the ordinary intellect, we may say that there is really only one species of salmon on the Pacific coast, but there are many varieties. The most important of all the Western fishes is called the California salmon, or *Salmo gairdneri*; they are found in all the important rivers, but particularly numerous in the Columbia, which they ascend in April, and where, ever since they were noticed by Lewis and Clark in 1807, they have been highly valued by the white people and Indians as well. That they were the fly under favorable circumstances, has been fully substantiated; and they generally attain much greater size than is common with the Atlantic salmon.

Another variety is known as the hooked-nose salmon, which is smaller than the preceding, and numerous in the streams of Puget Sound and the more northern streams, where east winds are taken by the Indians and prepared for winter use. They ascend the rivers in the autumn; their flesh, when in season, is yellowish, but highly esteemed, and their apparent deformity of snout is peculiar to the male fish. Then comes the hump-backed salmon; the deformity in this variety being caused by a thick layer of adipose matter, and here again the male has the honor of giving his race their name. They ascend the rivers in August; average only about six pounds in weight, and the flesh is white, and only rarely is noticed along the coast. Another variety, of no great importance, is called the red salmon, or by the Indians *tehu-nin*. It is generally less than two feet in length, and ascends the Columbia in September.

There is a large salmon peculiar to Behring's Sea, the skins of which are used by the Indians for making their garments; also a variety taken in Puget's Sound in the autumn and called the chinook salmon, or *Oncorhynchus tshawytscha*; a large variety in Puget's Sound called the towhee, with a perfectly white flesh; and then follow what are called unsalted salmon, weak-tailed salmon, a white salmon, a short-tailed salmon, a square-tailed salmon, and the *suk-kegh* salmon, which is the best summer fish in Fraser River, and which has the eccentric habit of dying immediately after reaching a certain lake out of which the river runs. In view of the fact that the varieties of salmon are found in the waters of the North Pacific, we must conclude that there is no scarcity of trout in that region, which is indeed true; and I may chronicle the fact right here, that I have seen the portrait of an eight-pound lake trout, whose mother was a native of the Sacramento River, but who first saw the light in one of the rivers of Japan.

## Natural History.

### HABITS OF THE BEAVER.

(*Castor americanus*.)

IT may seem at first thought a waste of time to add pages to what has been already written in regard to this animal; and yet a gleaner may sometime pick a head loaded with grain, and he may sometime find stinging shooks where grass is slightly predominant. How little, from the one, and incurring all hazards of the other, I desire to "offer a few remarks" on the American beaver. With past experiences and omissions before us, and with the philosophic scrutiny the naturalist now brings to bear upon the phenomena of animal life, this can be better done than ever before; and we owe that much to the public, particularly the young, who are and will be looking more with each day to these pages for reliable facts.

Thus far the character and habits of the beaver have been studied mostly from "aniquities." Looking at an old dam and speculating as to how this or that work was done is guess work at best, and liable to be overturned or set aside by the next gusher, while to look on as the work progresses and to see how all parts are accomplished is another thing entirely, and true for all time. The unity of purpose, the union and harmony of effort, the silent communication and thought, the perfect intelligence of every movement, make together an exhibition of skill wherein human intelligence is strangely overlapped if not overmastered. My object is to enforce those great underlying truths in organized life broader and deeper than pure, cold science has yet reached, or in its present aspects is ever likely to possess.

When I read Mr. Collins's story of beaver life in Nova Scotia during the last shooting season, I was pleased beyond expression. Here was something new, neither old hash nor guess work; here was a picture of industry, life, and home, worth all that had been previously written of the animal. I could almost see him come out in the twilight, look over his ruined house, and then set to work to restore it. I could see him lay and relay the sticks of which it was composed, working full back and shoulders ached, and then sitting up a moment to rest. Ah, Brother Collins, you could not draw trigger on that "little old man" working to build up his ruined house, and he would have been done. I should have done the same thing for the same purpose once, but I should have felt like fording the stream and putting back with my own hands every stick and every handful of earth I had removed.

But the larger work on the dam just below was missed, a blank in natural history it is our luck to fill out, "acknowledging in, etc." that the whole merit belongs to a sportsman naturalist who seems, as you will see, under the circumstances of the natural history, became imperative, demanding verification. Here was an opportunity to reach the inner life of an animal whose works had been repeatedly described as exhibiting human intelligence, but whose method and manner of accomplishment no one had seen.

With two assistants the dam of an undisturbed family was broken down to the bottom, displacing a large log which formed its base. Then with jeers at his "dam foolishness" his companions returned to camp while he, secreted in the bushes close by, awaited the result.

He says: "At early twilight five beavers came out from holes in the bank and looked the devastation all over. Their capacity could not reach the cause, they only saw effects." The first effort was to get back to its place the bed log. It was wet, heavy and slippery, their united strength could hardly move it, so that after tugging a quarter of an hour it was abandoned. They then went down the stream, gathering up the sticks of the dam, the smaller ones were held above the water, the larger ones towed up, the beaver holding by the teeth and swimming by its side.

"There was standing on the bank directly above the dam, a willow tree some twenty inches in diameter. They all gathered about this tree, one on the upper side, all the others on the lower side next the dam. Those below them applied their teeth to the trunk. The great gorges, all in turn as one became tired, so that in less than ten minutes with an axe would have done it, the tree tottered to its fall. All at once withdrew from the lower side while the 'master mechanic' began cutting to cut away the remaining support, this was done, cutting a little here, and a little there, often looking upward, so that the tree fell with a crash squarely upon and across the crevice in the old dam. The tree was several feet above the water by its branches, and the beavers all disappeared in the water. I was not sure what they were doing, but the tree began to settle and soon rested on the dam. They had cut off the branches which held it up.

"Then commenced the process of closing the breach. A beaver would draw up a fair 'cordwood' stick upon the dam, raise it on end, hugging it against his shoulder and neck, letting it slide down diagonally up stream, leaning against the fallen tree. In the meantime a beaver at the bottom was digging a 'post hole' and guiding the post to its place. When this was done the digger would come to the surface to breathe, while the one on the log would cut off the stick if too long for fair work. When the sticks of the old dam were all used they would go into the bushes and soon return, backing out and dragging along a stick, which was placed in the same manner. This was repeated until the whole gap was filled. The process of covering this gap with the earth, leaves, and branches, however, was to hand was done precisely as Mr. Collins described, hugging a mass against chin and neck and swimming with hind feet and tail. And thus, forgetful of time, I watched with absorbing and often with almost breathless interest, the progress of the work, so that when darkness faded into daylight the dam was completed, the tired workers had retired, and I left for camp repeating the resolution, 'I have killed the last beaver, the very last, and I have done it!'

This is the point where the sportsman and naturalist rose from savage to civilized life.

There occurs here a question for the philosophic naturalist to settle as he may. What was the medium of communi-

cation that made such unity of purpose and such union of effort in the accomplishment? The position of the old beaver above the tree indicated leadership, but no order, by word or sign, was given; all seemed to know what to do, and just how and when to do it.

The felling of a tree across a stream and building a dam against it, is one thing; felling a tree so it should not vary a foot from a given line, the old dam, showed an engineering skill you may possess, but which I should hesitate to assume. We must define instead as directing a few things without forethought or previous knowledge, and repeating the same methods ever afterward. The bee builds the same cells, of the same material forever. The first and the last nest of the bird are precisely alike, and animals who dig holes in the earth have each a fashion peculiar to itself, which does not vary; even the acquisitiveness of the ground squirrel is no thought for the morrow, since he hoards in the spring with all the industry of the industrious bee.

But the beaver goes far beyond this. Instinct is over lapped by reason until separation is impossible, and all division lines are obliterated. He selects with engineering skill the site for a dam, then builds of such material as at hand and of such shape as the exigencies require, varying both as circumstances indicate; and conducting all with a degree of intelligence that trends closer upon the heels of humanity than that of other animals ever living. Why, an animal so gentle, so harmless, should be left outside the pale of civilized life, debarred human association by clumsy form and unseemly personal habits, is one of the mysteries in nature not yet solved, but such is the fact. To him the step of civilization is simply and inevitably annihilation.

What we need is more of this wild native animal. An animal in captivity with, perhaps, every condition of free life violated; say a bear chained, or one with a halter about his neck and leashes in his submission, and both be poor subjects for the study of natural history to say the least; an ox drawing a plow would be better. And now that men of high intellectual taste and culture fly more and more to the wilds of nature for summer recreation, may we not hope and expect more of that inner life in nature found just in proportion as the tracks of men are less frequent.

SPRINGFIELD, MASS.

B. HORSFORD.

### SNAKE NOTES.

I noticed in your recent issues, a letter on the breeding and habits of snakes. I can give some light on the subject from personal observation. One day last August my brother and I were fishing along the rocky bank of Big Flatrock Creek, the southeast fork of White River. We heard a little rustling in the leaves and weeds in front and at our right, and I got up what was the matter, and there we saw a large black snake doing his best to swallow a water snake half as long as himself, and had it half way down when we first saw him. My brother and I got some rocks, and before long he disgorged his prey in a rather dilapidated condition, but not dead. No doubt the latter was thankful to us for our timely interference, for he was going down a long black tunnel to another country. We measured the black snake and found him to be seven feet in length and the water snake three feet six inches; and the latter was larger in the largest place than the black snake was around his neck or throat, and when first seen was swallowed down past the largest part of his body, head downward. On another occasion, earlier in the year, I killed a black snake, and, thinking it large, I opened it and found nine young snakes in it, some twelve or thirteen inches long and about as large as a penknife when alive, and I considered I did good work in killing ten snakes in a day.

GREENSBORO, IND., March 12, 1888.

In your issue of March 1, under the heading, "Breeding of the Rattlesnake," "E. S." says: "He knows that the rattlesnake is propagated from the egg." Another writer writes aside the egg theory by saying: "His brother and others saw a female rattlesnake delivered of nine small snakes—eight alive, one dead."

I have had some experience with rattlesnakes, or "canebrake" as we call them, during some fifteen summer vacations in Pike county, Penn. Last August, in returning from a trip after berries, and nearing home, on the track of the Erie branch, I stepped from the "road" making an afternoon meal on the grease from the car axles. As his head was in fine position near the rail, a well-directed stone killed him. I carefully carried him home, having only to cross the Lackawanna, and as he was such a beauty, and wishing to preserve the skin as well as secure the oil, I carefully skinned it, after cutting off the head and consigning it to the fire, when, to my surprise, on opening the snake I found fifteen eggs, resembling a pecan nut in size and shape. About two weeks previous to this a snake was opened at this same yard containing nine full-sized eggs. Now if snakes are not propagated from the egg, what were these fifteen eggs for? I have three fine skins and rattles from Pike county in my cabinet, and will take pleasure in showing them to any one interested in "rattles." C. H. STYLES.

1,419 LEXINGTON AVE., N. Y.

[These snakes can swallow animals much larger than they themselves are, is a well-known fact. As for the eggs of the rattlesnake, we would suggest to our correspondents that there is nothing necessarily inconsistent in the differing views expressed by them, for many snakes are known to be ovoviviparous, i. e., the eggs are hatched within the mother. Let them remember the ancient truth, *Omnis vivum ex ovo*.]

NEW JERSEY WINTER BIRDS.—Noticing that this week's FOREST AND STREAM has observations on our winter birds, I will send you a list of those I have observed and procured (with a few exceptions) during the past three winter months: Red-shouldered hawk, marsh hawk, sparrow hawk, sharp-shinned hawk, barred owl, mottled red and gray owl, downy woodpecker, yellow-bellied woodpecker, hairy woodpecker, common crow, blue jay, "Bob" white, robin, meadow lark, bluebird, white-bellied nuthatch, tufted titmouse, black-capped chickadee, ruby-crowned kinglet, pine grosbeak, purple finch, song sparrow, snowbird, tree sparrow, goldfinch (yellow bird), English sparrow, white-throated sparrow, redpoll linnet. The robin made his first appearance during the last few days of February. Bluebirds are with us all winter. The pine grosbeaks were seen the latter part of December; banded two females.—OLD TURKEY, (Long Hill, N. J., March 15, 1888).

### THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

241. Great Scaup Duck—*Fuligula marila* Aud., Cs. 720; *Fuligula marila* Ridg. 614.—Common during migrations. Sometime abundant in autumn.

242. Little Scaup Duck—*Fuligula mariloides* Aud.; *Fuligula affinis* Ridg. 615; *Fuligula affinis* Cs. 721.—Found here during migrations, but not very common.

243. Ring-necked Duck—*Fuligula ring-necked* Aud.; *Fuligula collaris* Ridg. 616; *Fuligula collaris* Cs. 722.—Uncommon. Mr. Boardman reports this species as having been known to breed near Princeton, Me., where "adults with young were seen, and eggs have been taken near St. Stephen, New Brunswick." But these cases may have been exceptional ones. The species is the most common and irregular occurrence elsewhere throughout the State. There was one shot at Scarborough, Me., May 1, 1878. A number were shot in Cumberland county in the spring of 1882, an unusual occurrence. Of this number two males were shot at the mouth of the Presumpscot River, March 31, 1882. Three of this species were shot at Great Pond, Cape Elizabeth, in April; one was brought to market from Gray, April 14, and several others were shot near Portland in April.

244. Ruddy Duck—*Fuligula rubra* Aud.; *Erimophora rubra* Ridg. 634, Cs. 741.—Not uncommon during autumn migrations. This singular little duck, with its broad bill and large feet, seemingly out of proportion to a body scarcely larger than that of a teal duck, and a stiff tail which appears as if the feathers had been scraped with a knife, is of an exceedingly unsuspicious nature, and easily shot wherever found.

245. Redhead Duck—*Fuligula ferina* Aud.; *Aythya americana* Ridg. 618; *Fuligula ferina americana* Cs. 723.—Uncommon; an irregular visitant.

246. Canvas-back Duck—*Fuligula collinsiana* Aud.; *Aythya collinsiana* Ridg. 617; *Fuligula collinsiana* Cs. 724.—Uncommon; an irregular visitant. In October, 1874, there were procured two ducks by a shot into a flock of fowl in Casco Bay, near Portland. One of these proved to be a canvas-back duck, and the other a redhead. The latter shot the latter species at Scarborough, and have seen at various times a number of canvas-back ducks which were shot in Maine. A pair, male and female, were shot at Great Pond, Cape Elizabeth, Nov. 1, 1880.

247. Golden-eyed Duck—*Fuligula clangula* Aud.; *Clangula glaucion americana* Ridg. 620; *Clangula glaucion* Cs. 725.—Abundant. A few breed in the interior and northern part of the State. Abundant in the estuaries and bays along the coast throughout the winter. Locally termed "whistler," on account of the loud whistling produced by the wings of this species when in rapid flight.

248. Iceland Golden-eyed Duck—*Clangula islandica* Ridg. 619, Cs. 726.—Uncommon, except on the eastern portion of the coast, where it is commonly found in winter, and is probably there a regular visitor. Adults may be easily distinguished from the preceding named species, by the form of the bill and the white patch on the cheek of males differing from that of the common golden-eyed ducks or "whistlers."

249. Buffle-head Duck—*Fuligula albicollis* Aud.; *Clangula albicollis* Ridg. 621, Cs. 727; Common. Arrives early in April. Autumn migrations in November and extending into December. Occasionally a few remain on the coast throughout the winter.

250. Long-tailed Duck—*Fuligula glacialis* Aud.; *Harelda glacialis* Ridg. 623, Cs. 728.—Very abundant along the coast. None breed here. Locally termed "old squaw." Its cry is well expressed by *Quacco*, the name applied to the bird by the Micmac Indians of Canada. Many ducks of this species remain along our coast throughout the entire winter; but the greater portion of the vast numbers of migrants pass to the south. During the fall and early May thousands arrive at Saco Bay, where they are detained by the superior attractions of an abundance of their favorite food, the little crustaceans, commonly known as "sand-fleas," which are easily obtained by the ducks in this broad shoal bay with its smooth sand bottom. Here the old squaws remain until the third week of May, when they have acquired the perfect plumage of spring and have become very fat. Unlike others of our sea ducks they appear to be polygamous. At the time of their departure for their nesting places in the far northern region there occurs a great assembly of all the birds of the species in the bay, and during the latter part of each day, flock after flock will rise from the water and circle about, frequently ascending so high that a flock of a thousand or more is nearly lost to view, appearing to the unaided vision as a faint cloud of moving dust. These evolutions are sometimes prolonged for several days, as the birds were training themselves for their intended long flight in the upper air. Occasionally a flock of many hundreds will make a trial trip inland of a half hour's duration, or even for a longer time, and return again to the bay. At such times the birds are especially active during the dusk of evening. It is then that a flock returning high in the air from an inland trip will set their wings upon approaching the shore, and descend at an angle of forty-five degrees with such velocity as to produce a roaring sound to be heard at long distance, especially when the flock is a very large one, and the descent is commenced from an altitude of many hundred yards.

The final departure is almost invariably made late in the day, or after sunset, and the birds take a course nearly north over the land. But few are to be seen the third day after the departure of the foremost flocks of this great assembly, excepting the usual number of birds which are barren or incapable of the long journey. Such of these as are not captured by fish or seals remain here throughout the summer, and moult in July.

No other species of ducks mingle with the long-tailed ducks in their migration. Indeed none of their associates upon the bay would be capable of sustaining the speed of this species, the flight of which exceeds in rapidity that of any other duck known here. On account of their rapid flight, small size, and great tenacity of life, they are the most difficult to kill of all our ducks, and hence afford excellent sport to all who are fond of fowl shooting. They readily come to decoys in May, and no means of shorting in vogue will drive them away, except that of sailing to them on their feeding places; a method effectual in causing them to abandon the vicinity where practised.

251. Labrador Duck—*Fuligula labradorica* Aud.; *Comptolobus labradoricus* Ridg. 624, Cs. 729.—Extremely rare. Mr. Boardman has obtained several specimens in the course of many years. The species was not uncommon on the New England coast in winter fifty years ago, and probably is not yet extinct. A single specimen, a female, was shot in the Bay of Fundy, near Grand Menan Island, in April, 1871, by Mr. S. F. Chagnon, who is well known as an Eastern bird collector. Since that date, a specimen has been killed in Michigan, at Delhi Mill, April 17, 1872, and its skin preserved in the collection of Mr. A. B. Covert, of Ann Arbor, Mich., the fact having been reported in FOREST AND STREAM.

It is quite probable that a very few ducks of this species yet remain on the coast in winter. Should any be shot here, they would be likely to fall into the hands of fishermen or others, and be unrecognized and unreported. This species might be confounded with the "old squaws" by gunners who are not observant of the differences of the birds they shoot.

252. Harlequin Duck—*Fuligula hibernica* Aud.; *Hir. tricoloris marila* Ridg. 622, Cs. 736.—Not very common, but of regular occurrence along the coast in winter, frequenting the outermost islands and ledges. Locally termed by the fishermen and others "lords and ladies," to designate the sexes, which are unlike in plumage. That of the male is rich and variegated, and the term "lord" is not inappropriate as regards the costume of this bird, but the female is a very plainly dressed "lady."

These ducks are very active, expert divers, and generally wary; and as their haunts are not easily accessible but few of the birds are shot.

253. Eider Duck—*Fuligula mollissima* Aud.; *Somatrida mollissima dresseri* Ridg. 637a; Cs. 739.—Abundant throughout the winter along the coast. A few yet breed in Maine. Locally termed "sea-ducks," or "sea-ducks and drakes" by gunners and fishermen. Although some of the closely allied species of scoters are frequently found on our lakes, the eider ducks confine themselves exclusively to the coast.

These are the largest ducks known on the Atlantic coast of America, the adult males averaging a weight of more than five pounds each, the females weighing about a pound less.

Their food here consists of shellfish, usually procured from ledges, and sometime in ten fathoms of water. They arrive from the North late in October and in November, and depart early in April for their breeding places. They are generally mated before this departure, and while migrating in the spring many are seen in long lines, the drakes and ducks in regular alternation, a variety of more than fifty distinguished from the uniformly dark-colored females by their white backs and fore parts, conspicuous at a long distance.

In the autumn migration, however, the flocks present a different appearance, and the sexes are not then generally mixed in flocks composed of adult birds. When migrating they usually fly low over the water, and are enough from the shore to clear all headlands without much altering their course. Vast numbers, however, fly across the land at the head of the Bay of Fundy. When thus passing over the land, if frightened by a great noise, they will swoop down close to the earth and sometime alight a near shot.

While sheep shooting on the Tautamash marshes I once brought a huge flock down by shouting and discharging one barrel of my gun, and when they swooped I shot each with the other barrel, which was loaded with No. 9 shot. Their strong bones and dense plumage render them as difficult to kill as Canada geese. Occasionally they come in contact with telegraph wires, and such an instance occurred near Moncton Junction in New Brunswick, whereby a dozen from one flock were left dead or crippled on the ground. The weather was thick, and the flock, frightened suddenly by shouts, swooped down at a place where there were many wires.

Although many eider ducks are annually shot on our coast by fishermen gunners, but few others trouble them. The sport is usually cold, rough, and oftentimes dangerous, except during the autumn migration. Yet there are sportsmen who are not deterred by the exposure and danger of winter shooting on this coast, and a knowledge of the habits of the birds is necessary to one to kill many of these ducks, although they are many and usually frequent the most inaccessible places.

The eider duck lays a complement of five pale green eggs which are deposited usually during the month of June and July. The nest is composed of down which the duck plucks from its lower parts for this purpose. Sometime the nest is placed upon the bare rocky shore, sometime on the turf of a grass grown island, and at other times on the ground which is covered with seaweed. When the female has nest voluntarily she covers the eggs entirely with the down composing the border of the nest. After the first egg has been laid, each succeeding one is deposited at an interval of a day or two, until the set is completed. Often each egg may be numbered in the order laid, by a comparison with the others in the same nest. The eggs quickly become soiled by contact with the body of the bird, and in every case by the nest appears darker than one just laid. Washing with water will not restore the shade, but it may be restored by scraping the eggs. More than five eggs are rarely found in a nest, and in the isolated instances of more than six having been found in one nest, it is probable that they were laid by two ducks, as ducks of this species breed in communities. The males do not assist in the incubation, but at this time associate together in flocks, and the change is marked before that of the females.

These large and hardy ducks would prove of great value if domesticated, and perhaps could be cross-bred with domestic ducks to advantage. Their feathers and down are valuable, and their flesh, naturally of good quality, could be much improved by a diet of grain. The eggs are of fine flavor, and very large.

For many years a great business was carried on by vessels sailing from Halifax, Nova Scotia, and returning to the northern breeding places of seaweed with cargoes of fresh eggs. The eggs of the eider ducks were most sought, on account of their superior quality. The ordinary note of the eider duck is a genuine quack, not unlike that of the mallard, and quite different from any of the cries of the scoter ducks. Although rarely found on fresh waters, or even in the mouths of tidal rivers, salt water is not essential to their existence. They will readily eat grain, but are fond of nothing but the omnivorous domestic duck will eat, although in a wild state the eider ducks subsist chiefly upon shellfish, such as mussels, etc. The readiness with which this species becomes domesticated may be illustrated by the incident below related, concerning an eider duck which undoubtedly had been raised or kept in captivity.

One summer evening, at dusk, an eider duck was observed in a pair of domestic ducks in the doorway upon one of the isolated islands of the Bay of Fundy. An attempt was made to decoy the ducks into a pen, but the eider duck flew to the shore, about a hundred yards distant from the house.

At daybreak the next morning I again observed the duck in the dooryard. A trail of corn was now laid extending into a pen, and the tame ducks fed along the line, followed by the stranger, until all three were within the inclosure and captivity.

The owner of the premises had at various times hatched and raised eider ducks, but none within two years, and he did not remember the loss of any at a previous time. After some days' confinement, during which it was well fed on corn, the eider duck was released. It continued to come to the house at night when the domestic ducks returned from the bay, where they spent each day, and became so tame as to suffer a near approach without immediately taking to flight. One day, while we were on an excursion in a small boat and three miles from home, this duck appeared and flew about us, coming to a familiar call repeatedly within twenty yards of the boat.

This duck probably had been reared in captivity, and perhaps had that season suffered a destruction of its nest and eggs, and therefore sought the nearest mate in the barnyard drake, which passed each day about the shores, and returned home at night. An eider duck will not lay its eggs a second time in a nest once robbed, but seeks a new nesting place.

In the domestication of these eider ducks there is an open field for the poultry fancier and others, that might be filled to future profit by this improvement of our domestic variety.

254. King Eider Duck—*Fuligula speculabilis* Aud.; *Somateria speculabilis* Ridg. 639, Cs. 736.—Not very common. Probably some visit our coast each winter, but never in abundance. The haunts of this species are more northern than those of the common eider ducks. The king eider ducks appear to be much less wary than those of the other species. I once saw some king ducks in July, near a locality where the common eider ducks were breeding, but the plumage of these ducks was immature and I failed to find any breeding place of this species.

Quite a number of king ducks were shot in Casco Bay near Portland during the spring of 1875, and also of 1876, but all of these were immature birds, and I have not known of any adults in perfect plumage taken on our coast.

The females of this species much resemble in form and plumage the female of the common eider duck, except that they are of smaller size than the latter.

But the male king eider duck may be easily identified even before maturity, by the form of its bill, which has an abrupt rise on the upper mandible near the base, making the outline of the bill quite unlike the rather uniform slope of the upper mandible of the bill of the common eider duck.

The eyes of the king eider duck are yellow, those of this common species are brown. In size it is about one-fourth less than the more common species known here. Although a coast duck, the king eider sometime strays inland. In the FOREST AND STREAM of March 8, 1877, the capture of a specimen near Syracuse, N. Y., was reported; and in the same journal was reported (December 25, 1879) the capture of eleven in Niagara River, Nov. 24, 1879. These latter probably came from the North, via the St. Lawrence River.

255. Velvet Scoter, White-winged Scoter—*Fuligula penicillata* Aud.; *Melanetta penicillata* Ridg. 632, *Oidemia penicillata* Cs. 738.—Abundant during migrations, and some remain on our coast throughout the winter. This is the largest of our scoters, all of which are locally termed "coots." Many flocks of this species annually take their departure from Saco Bay, during the month of May, and fly northward high in the air over the land. A few of the other two species of scoters known here likewise migrate home in the spring after the end of their breeding places, the lakes and the far north. Unlike the eider ducks, the scoters do not breed on the coast, although a few remain here throughout the summer, and I have observed some here at that time which apparently were mated.

256. Surf Scoter, Patch-head Scoter—*Fuligula perspicillata* Aud.; *Pelecanus perspicillatus* Ridg. 633; *Oidemia perspicillata* Cs. 739.—Abundant during migrations. Locally termed "patch-head coot." The immature birds of this and the next named species are locally known as "gray coots."

257. American Scoter, Black Scoter—*Fuligula americana* Aud.; *Oidemia americana* Ridg. 630, Cs. 737.—Abundant during migrations. Locally termed "butter-bill coot." This species is quite common on some of the Maine lakes during the October migration. It is the smallest and fastest flying of the three species of scoters known here.

258. Buff-breasted Merganser, Goosander—*Mergus merganser* Aud.; Cs. 743; *Mergus americanus* Ridg. 638.—Common during migrations; arrives from the South in March and April. Occasionally some remain on the coast throughout the winter. A few regularly breed in the interior and eastern portions of the State. Largest of the mergansers, and locally known as the goosander or greater sheldrake. Apparently its haunts are more northern than those of the next two species.

259. Red-breasted Merganser—*Mergus serrator* Aud.; Ridg. 637, Cs. 744.—Abundant during migrations. Arrives from the South in April and May. Breeds commonly throughout the State. Lays from twelve to eighteen eggs in June, and the young can fly well in August. Much the most abundant species of merganser in Maine. Locally known as the common sheldrake.

260. Hooded Merganser—*Mergus culicivorus* Aud., Cs. 745; *Lophodytes cucullatus* Ridg. 638.—Common, but never abundant during spring and autumn migrations. Arrives in March and April. Probably a few breed here. Locally known as the "little sheldrake" or "hooded sheldrake."

#### FAMILY SULIDÆ: GANNETS.

261. Gannet—*Nela bassana* Aud.; Ridg. 650; Cs. 746.—Not very common, and now rarely taken on our coast. A few years since one was picked up on the land at Scarborough after a severe storm. As it was from the coast of Maine, and do not often come very near the shore, but few are captured. No other species of gannet is known on the coast of Maine.

#### FAMILY GRACULIDÆ: CORMORANTS.

262. Cormorant—*Phalacrocorax carbo* Aud., Ridg. 642, Cs. 750.—Abundant along the coast during migrations.

263. Double-crested Cormorant—*Phalacrocorax dilophus* Aud., Ridg. 643, Cs. 751.—Abundant during migrations along the coast. The cormorants are locally termed "shag" by fishermen. None breed on the coast of Maine, although some remain here throughout the summer. These are chiefly immature birds, which keep together in flocks and habitually resort to the same ledges each night to roost.

#### FAMILY PELICANIDÆ: PELICANS.

264. White Pelican—*Pelecanus americanus* Aud.; *Pelecanus erythrorhynchos* Ridg. 640; *Pelecanus trochyrhynchus* Cs. 746.—A rare straggler from the South. This species has been taken in the Bay of Fundy, and Mr. Boardman informs me that one frequented the St. Croix River one autumn,

and was seen there repeatedly by many persons, but was not captured.

265. Frigate Pelican—*Torquigaster aquilus* Aud., Ridg. 639, Cs. 761.—A rare straggler from the South. Mr. Ruthven Deane has recorded (Bulletin N. O. C., Jan. 1879) the occurrence of this species on the coast of Nova Scotia. Mr. Andrew Davies, of Halifax, N. S., procured the specimen, which was "shot outside of Halifax harbor, October 16, 1876." As this bird passed from the South along the coast to the east of Maine, it may perhaps be mentioned here quite as properly as other coast stragglers.

[TO BE CONTINUED.]

MOCKING-BIRD IN MASSACHUSETTS.—While out with my gun to-day, I had the rare good fortune to secure a specimen of the mocking-bird (*Mimus polyglottus*). I was returning home, and as I had to pass very near a small snipe meadow, I thought I would look along the edge and see if I could not find a snipe. I had hunted it over thoroughly without success, and was starting for home, when I observed a bird fly over a river near by and alight on the other side. As the bird looked strange to me, I determined to get it if possible. I walked back nearly half a mile to a bridge, crossed the river, and walked back on the other side. Before I reached the place where the bird alighted, I saw it in company with some sparrows. It was wild and would not let approach near enough to shoot it with small shot. When I got within about thirty-five yards I fired, and had the satisfaction of seeing the bird drop into the water. I pulled it out, wet and dripping, but otherwise very good. Upon skinning I found it to be an adult female. Its crop was completely filled with bugs, flies, and other small insects. This is the first I ever knew to be seen or taken here. Mr. Samuels, in his "Birds of New England," says: "This bird is so exceedingly rare in New England, that it can scarcely be regarded otherwise than as an accidental visitor to Massachusetts is certainly its northern limit." Dr. Elliott Coues, in his "New England Bird Life," says: "The mocking-bird is practically restricted to its northward extension to the Carolinian fauna, and has but once been observed beyond Massachusetts, where, as also in Connecticut and in Rhode Island, it is a rare summer resident—if, indeed it be of more than casual occurrence." He also says: "According to Allen, writing in 1864, it has been known to winter in Springfield, Mass., several times within five years, and two pairs nested there in 1860."—JOHN C. CATOON (Taunton, Mass., March 26.)

SNOW BUNTINGS AND MEADOW LARKS.—Hartford, Conn.—Editor Forest and Stream: "J. L. D." is rather surprised to learn that snow buntings will alight in trees. I have noticed them in trees in New Hampshire, Vermont, and Maine very often. "Medicus" will find meadow larks during the winter months in Connecticut Valley as far north as Northampton, Mass., but not as numerous as in the fall of the year. Game has wintered well here (in the market), as we have quail, grouse, pigeon, venison. The game laws are not enforced here, as woodcock shooting began in July, the law not being off until October.—FLICK FLICK.

MEADOW LARK AS WINTER RESIDENT.—Philadelphia, March 31.—Noticing "Medicus's" interesting communication in your last week's issue relative to the wintering of the meadow lark in Pennsylvania, and noting his having killed one near Media, Pa., recalls the time, not seven years ago, when the then open fields around West Philadelphia, to the writer's knowledge, were the resorts of a large flock of these birds, especially in very cold weather and when snow lay on the ground. Even at that time they can be found every winter in the "stump fields" on the line of the Baltimore pike just beyond the county line. Both male and female birds quite often remain with us all winter, at least used to.—HOSO.

## Camp Fire Flickerings.

"That reminds me."

OLD Bill Lane, of Shinnecock Bay, is never at a loss for an answer. One night, after a cold day on the bay, when more whisky had been slaughtered than ducks, we all sat around the stove and yied with another in our personal experiences in field and "marsh." The yarns grew more and more improbable, till the climax came from Doctor M., of Brooklyn. The good Doctor is of an imaginative turn, but too much bad luck or bad rum had made him disregarding of the fact. At last he said: "I was out shooting one day and struck a bunch of quail. It was in the old muzzle-loader days. My dog had come to a point. I flushed the birds and they went up and another in my snapper. What was my surprise when the bird fell. I walked up, picked it up and it was stone dead! Now how do you account for that, Mr. Lane?"

Bill looked at him with a sly twinkle in his blue eye, changed his foot, thrust his hands deeper into his pockets, and said: "Wal, now, I shouldn't like to account for that, Doctor M." There were no more stories told that night.

THE JUDGE.

Have you heard of the wedding of S., one of Long Island's best-known "sports"? Devoted from infancy to dog and gun. A good fellow, but a bit wild; untamed, perhaps. He was married the other day; and for the first time since childhood entered a church. He tells the story himself:

"Presently I saw the parson motioning to me with his book. I couldn't understand it and looked inquiringly at him. Again he raised it to his chin and brought it downward. Still I couldn't make it out. At last he whispered, 'Down charge, close!' Then I knelt; and that was what he wanted."

THE JUDGE.

Scene—Caroline county, Maryland; sun two hours high. Yours truly out "squirrelin'" armed with a long rifle, passes through a cornfield in which are two "culled gemin'" industriously engaged in husking corn. The usual "Howare you" is exchanged and work suspended for a minute examination of the rifle. Darkey No. 1 takes it, aims at several cornstalks, says: "Yes, tubercular good gun, mooses long es ole Uncle Ross's do." "Why," said I, "is his any longer?" "Oh! bress yer, yes, child; why, he was out squirrelin' this mornin' on sen or squerl or big gun." Uncle Ross puts up on busts a cap on 'im, but she done go; lays her down, looked in ther bar' n seed ther charge comin', puts her up agin quick en killed ther squerl dead."

Darkey No. 2 now chimes in, and says: "Saved ole Uncle Ross er right smart er trouble do ef he'd pulled trigger force he left home."

BROOKLYN, Long Island.

## Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will our correspondents favor us with such notices?

### FARMER VS. SPORTSMAN.

IF we are to continue to roam at will with dog and gun through the covers, or follow unmolested the trout brooks that course through the meadows of the farmer, it would be wise to stop and consider, and see if we cannot do something to remove the prejudice that exists toward our class. It is not pleasant to ride a dozen miles to a splendid cover that you enjoyed shooting in last year, and find posted the notice "No shooting on these premises," or to journey to a fine trout brook you have fished with good success for years, and while still sitting in your wagon read on a board posted where the brook crosses the road, "No fishing allowed."

I fear, however, that shooters and fishermen are very largely responsible for this state of things. Mark you, I do not say sportsmen, for to my mind a true sportsman must be a gentleman, not necessarily wealthy or highly educated, but a large-hearted, whole-souled fellow, who would scorn to do a mean act. If all who use the rod and gun were of this class there would be little trouble, and the grounds of the farmer would very rarely be found posted. But unfortunately there are some who belong to the shooting and fishing fraternity who conduct themselves as though they thought the farmers, on whose grounds they were trespassing, had no rights which they were bound to respect. I have seen a man deliberately tumble the top of a wall down because he was too lazy to climb over it, and I have repeatedly seen where a rod of wall had been literally torn down to take out a rabbit. I have also seen the tall grass that had been ruthlessly trampled down not man or stingy to cut, and because of these things the sportsman is set aside.

Farmers are a class as not mean or stingy, quite the reverse, as many of us can testify. When I was about a dozen years old my father gave me a gun and fishing-rod to use, and for more than thirty years I have used them faithfully. Not the same old twenty-gauge muzzle-loader, or the same old twenty-foot rod; they have long been laid aside for others of improved pattern. But for more than thirty years I have used the rod and gun, and I have indulged in this recreation in all the New England States, and during all this time I think I have never been ordered off a farmer's domain but three times, and only twice in my own State. On these occasions I simply obeyed and indulged in no abuse. In one of the cases the owner was a New Yorker who spent his summers on his farm, and I was aware that shooters had been ordered off, but as the land was not "posted" and the cover a favorable one, I concluded to take my chances. The chances of my gun soon brought the hired man, who delivered his message, and I quietly left. Not long after I was out shooting with a friend, and toward night, after a very successful shoot, I arranged with my friend to look through a piece of cover, while I drove the horse around to the one where I had been ordered off, and where he should meet me. I found the owner at home and asked the privilege of looking through the cover. He met me pleasantly enough, but proceeded to state his grievance. He said that a brood of partridges had been killed and reared there, and he had hoped to get one for his wife, who was very fond of them; but that as soon as the law was off the hunters from the city came there and killed them all, and he didn't get one; that he cared nothing for the woodcock, and had no objection to my hunting, but that if I killed a partridge he wished I would give it to him for his wife. I hunted out the cover, killed a partridge, gave it to him, and with the pleasure he expressed, I was on my way well. I have hunted the cover the past few years, and have killed lots of birds there, and have never thought that I paid dearly for the privilege.

Another case happened last fall at one of our best covers for light woodcock, which is situated about four miles from the city. Two members of our club had just commenced to shoot there one morning when the owner came out of his house, and, having no quarrels, he remained in the cover, and, within hearing, and kept it up until he got up to my friend S., whom he ordered off in language more forcible than elegant. Now, my friend S. is a gentleman, and nothing would have induced him to indulge in such language himself; beside he had just flushed a woodcock and had him marked down, and was, therefore, very anxious to remain. So he began to reason with the man, told him that he would do him no harm, that he only wished to look over the cover for woodcock, and that was all. "I have just flushed one, and as it is right behind that bunch of alders, you take my gun and shoot him while I go round and put him up." The fight was all out of the farmer, and he replied, "I can't shoot anything; let me scare him up for you." And so he did, and S. killed the woodcock, and it is needless to add that he and his friend hunted the cover as long as they pleased. The farmer's excuse for the attack was that somebody not long before had shot at the cover out of "carelessness," and, therefore, was down on all hunters. Now, if my friend had replied to the man in like manner what would have been the result? If not blows, at least a disagreeable quarrel, and he would not have hunted the cover, beside the farmer would have retained the same opinion of hunters; whereas he learned that a hunter could be a gentleman, and he no doubt returned to his house heartily ashamed of himself. I firmly believe that if sportsmen would only learn not to "go off at half cock" when farmers approach them in a coarse, boisterous manner and order them off, but instead would show them that a sportsman is a gentleman, they could generally so arrange matters as to be allowed to remain, and in most cases would be invited to come again.

I am aware that there is another side to the question, and that there are mean men among farmers. Of course there are; and that is true of every class. There are farmers who hunt, or pretend to hunt, but out of "carelessness," they do not take themselves, neither will they allow you on their premises; they think a sportsman is a loafer; they hate a dog, etc. Not much can be done for these men; nothing would induce them to think differently. They would be glad if they could induce their neighbors to think and act as they do in these matters, but they cannot; they haven't much influence anyway, and, best of all, this class of men is not large. All there is to be done if we will, is to tell them that they order us off, and we will do no good to tell them what you think of them. Such men are gener-

ally despised by all mankind, and they know it well enough.

That this class of farmers have very little influence I was thoroughly convinced while attending a meeting of the Worcester County Grange, a little more than a year ago. The meeting was held in one of the halls in this city, and the afternoon session was open to the public. It had been announced in the daily papers that the following subject would be discussed:

"*Theraps, the sportsmen of this State have caused a law to be enacted that makes the shooting of game by farmers on their own premises so certain that it is almost a criminal offense.*"

"*Theraps, certain representative sportsmen in this vicinity have offered a reward for the detection of offenders, thereby constituting themselves keepers of the law which they have made.*"

"*Theraps, the object in view is additional sport to the shooting 'travels' and not the good of society in general; therefore*

"*Resolved, That the agricultural community should resent this impertinent interference with its natural rights, and by united legal action, especially the enforcement of the trespass act, cause its interests to be protected and maintained.*"

I was at that time president of the Worcester Sportsmen's Club, and I received an invitation to be present. Being a county meeting it was quite a large one, and the members of the sub-granges from the various towns being present with their wives and daughters. It was as honest and intelligent looking a body of people as one could wish to meet; and I had a great deal of curiosity to see how the subject would be handled. I am pretty thoroughly acquainted in the neighboring towns, and as I took my seat in the rear of the hall and looked about I saw many familiar faces. A large delegation was present from my native town, and I found myself surrounded by men and women who were my boyhood friends and schoolmates. I cannot give a detailed report of that meeting; but as the discussion progressed I was very glad to see that a large majority of the farmers present recognized the fact that not all lovers of field sports were loafers and scoundrels. Some very pleasant things were said of our club, for which I felt deeply grateful.

The other element was, however, represented, and after several members had spoken Mr. Bernard, a woodsman who arose and walked slowly to the Speaker's desk and began to unroll his manuscript; and while doing so looked about him in a very confident way, as though he were entirely satisfied with the paper he was about to read. Now, this man was from my native town, and I have known him long and well. He has wealth, considerable ability, is well educated, the owner of one of the finest places in the town, and of course, an influential member of the grange. But the idea of his having prepared an elaborate paper on the subject under discussion struck me as being decidedly absurd. I should not have been more at sea endeavoring to deliver a lecture on astronomy than was this man with the subject he was trying to handle. He has not a rod of cover on his place where a game bird would be likely to live, and I doubt if he ever saw a man with dog and gun on his domain. I have no idea, not the slightest, that he could tell a shotgun from a rifle, a setter from a St. Bernard, or a woodcock from a quail, and yet this man read to us as though he thought he had the whole thing "down fine" and wanted us to understand that he couldn't tolerate a "so-called" sportsman. He quoted in a sarcastic way from the speeches made at the annual dinner of the sportsman's club as they appeared in the daily papers, also from the game laws "so selfishly framed by the shooting fraternity that a farmer's boy could not secure a woodcock." He claimed that the farmers were the natural and only owners of the game, and urged his hearers to see to it that the trespass act was enforced. And how was this mastery effort received? Was he applauded? Very faintly. It was apparent that it was too rank for their tastes. After the reading of this paper the "worthy master" announced that "there was a representative sportsman in the hall and he thought the members would be glad to hear from him." O! to have been equal to that occasion when they say something, and I did try to say a few words that should help to remove the prejudice that exists toward our fraternity. I shall not soon forget the many kind greetings I received from the members of the Worcester County Grange at the close of that meeting.

And now, brother sportsmen, let me say that I believe it is possible for us to so conduct ourselves toward the farmers that when we hunt about the covers or the trout brooks, in nine cases out of ten we shall be kindly received. K.

WORCESTER, MASS., March 27, 1888.

## NOTES ON THE QUAIL OF TEXAS.

I SEND an account of some things I have noticed of quail in Texas. Arriving in December at Fort Duncan, on the Rio Grande, Texas, I was told that the old ordinance against shooting of quail and quail. He said, "Oh, yes, plenty. Right down the river, near the banks, but you will never get more than two shots at a covey, for they go straight to Mexico." This seemed strange, for the river there is more than half a mile wide. Yet I found that he had told the truth. After losing a number of birds shot over the water and swept away by the rapid current, I always took my duck dog with me, and it was a novelty in quail-shooting to have my birds retrieved from the river.

I could always find them in the morning or late in the afternoon, seldom in the middle of the day, and finally came to the conclusion that they were hatched in Mexico and roosted there, and came over to feed. Had they found out that Mexicans do not shoot quail? Did the old birds practice the young on long flights before they started over the river with them? The birds were the Texas variety of the common brown quail (*Ardeotis caprimulgus*). Back from the river they flew no further when flushed than Northern quail usually do. They do not tie to a dog as well as the Northern bird. Once, however, I was for weeks on a road little traveled except by Mexicans, and I found them so tame that they would not even squat when my dog pointed, but move slowly along not twenty yards from me. They probably had not been disturbed for years.

The blue or scaled quail (*Callipepla squamata*) worry a great dog. He must point, going about half speed, if he keeps anywhere near his bird. They seldom fly unless hard pushed, and are very fast runners. I prefer to tie up my dog, and if the weather is hot shoot from horseback. I never hesitate about shooting them on the ground, and it is no contemptible feat to knock them over as they dart from bush to bush. They seem to fully understand the necessity of keeping some obstacle in range between themselves and the man that is to kill them, and as well as that, they are very wary. I have seen them in the bushes, and have found a covey that I could not get within gun-shot of on one

day, to be tame the next. There had been no change of weather, and I am unable to account for this difference. They are larger than the common quail, but I do not consider them as good on the table. I have repeatedly had one of each cooked to test this.

The Massena quail, called also black quail (*Cyrtonyx masena*) lie like stones. I once saw a pointer catch a full-grown unmounted one. They are trying on the nerves. Your dog points, perhaps, when there is no cover but short grass; you can see nothing and go slowly forward. All at once, with a peculiar chatter (that don't steady you a bit) they are up in front, behind, and to the right and left. I have seen good shots stand open-mouthed, not able to make up their minds which way to shoot. A full-grown cock Massena is such a beautiful bird that you smooth down his feathers carefully before you put him in the game pocket. To my taste they are better eating than any quail I have tried.

I believe that in Texas the quail have two broods. My journal says: "July 29, 1882, shot an common quail, almost full grown." And again, "September 20, 1882, saw a covey of common quail barely able to fly." The belief that they raise more than one brood seems to be general in Southwestern Texas.

I think it is rare that quail in Texas are killed by snow or cold in winter. Cold rains and floods in the nesting season and when the young are young affect the increase very seriously. Hawks are abundant and make great havoc among them. A hawk in a tree or hovering near one spot is a good sign that a covey of quail (probably scattered) is close by.

What quail do for water when the whole country is dried up and there are no dews, is a mystery. I believe they occasionally travel considerable distances for it. I accidentally learned that they do come to water at times. It was this way. I was shooting near Fort Clark, Texas, late in the afternoon, and found a covey in a small clump of bushes that grew by the edge of a small pool. I followed the scattered covey and killed several. Then went back to the pool to let my dog drink, and he pointed a second covey in the same spot I had found the first. I shot some of the last covey and found them to be younger and smaller than the first. I had been gone about twenty minutes, and they had come to the water during that time. They certainly were not there when I first pointed, as the cover was scant and my dog went over it thoroughly. It was three miles from the pool to the nearest water.

The quantity of quail in the vicinity of Fort Clark, Texas, last fall, was something wonderful. As I heard a sportsman express it, "every egg must have hatched." I have frequently killed as many as I wanted before breakfast. Many hundreds were killed, but their number was so great that plenty must have been left to breed. On account of the heat, shooting there is hard on man and dog before the middle of October. T.

FOUR LIXES, CALIFORNIA.

## A NORTH CAROLINA MEDLEY.

ABOUT the 10th of the present month (March), having a little leisure, or taking it by force, my friend and kinsman Teedel and myself, with our wives, shells and dogs, for a short jaunt into the upper part of our county, to see if we could find some sport with quail shooting in that section and the contiguous part of the county of Montgomery. We expected to meet our hunting companion, whom I have hitherto, somewhat euphemistically, called Bishop Crickett (but of whom I shall hereafter speak in reference to the wisdom of "setting him free"), as Crickett, only, and with him make an afternoon foray among the birds in the lowlands, just above the confluence of Little River with the Pee Dee. But from some cause we failed to be greeted by his genial smile, and went to work by ourselves. We soon started a small covey, and succeeded in getting two birds, when we heard the welcome voice of our friend Tom, the son of the gentleman whose hospitalities we proposed to enjoy during the approaching night, and for several successive ones hereafter. So sending our buggy forward by one of the "newly enfranchised American freemen," we took to the fields lying along the river, and hunted in the direction of the residence of our host. Birds were not numerous, and we succeeded in getting only eight.

Just before night, we had reached a point in the lowlands, not more than a fourth of a mile from the dwelling, which was quite marshy, but devoid of cover, and as for any game, as we approached it, we heard the well-known sound which the snipe always emits as he rises from his feeding ground. We saw more than fifty of them, but as they were at long range, we could only get three or four. Soon after reaching the dwelling, our friend Crickett made his appearance, and after the "inner man" had been delightfully satisfied by the abundant contents of the farder and pantry, which the wife and daughter of our host knew so well how to spread, we went into the parlor, and discussed all sorts of matters, from hunting and fishing, and dogs and guns, and rods and lines and hooks, down to questions of finance, and revenue and taxation, American and European, diplomacy and statesmanship, with an occasional allusion to Venner and Wiggins, and other sapient guessers at the coming state of the weather. Before retiring to my bed we had agreed to go down to the meadow in the morning at an early hour, and pay our respects to the snipe, which, at this agreement, my companions endeavored to keep me up, so that they might enjoy, for a longer time—so they said—"the feast of reason and the flow of soul," which I always contribute for the delectation of my associates. It is due to candor, however, that I should say, I believed then and believe now, their object was to gain by flattery what they feared they could not get in any other way—an escape from tedious breathing, which they were obliged to take as was unpleasant as the sound of the wolf's low howl from Oonalaska's shore. They failed in their hypocritical attempt, as all men should, under all circumstances. I sought the "downy pillows," was soon fast asleep, and astonished my friends by a slumber undisturbed by even a pleasant dream.

Early next morning Crickett and I were up and ready for a visit to the meadow, but Teedel was fast asleep, afterward alleging, as he always does, that he was nervous during the early part of the night. We got him up, however, and the three were soon engaged in a fusillade at the birds, which had collected in large numbers. But, as before stated, they were too wild for much sport, and each one that we got cost us several shells. If there had been cover for the birds in the meadow, I have no doubt we could have bagged several dozen before breakfast. I have never seen them so numerous. And they were equally plentiful ten days later, when we went out to the meadow, and killed. Therefore these birds have usually made their appearance in our section during the early part of April; but this year, being decided

by the weather prophets of Canada, or the balmy atmosphere of February, they started upon their summer tour.

After breakfast, being joined by Tom, who has an excellent gun, which he handles well when "russy" (morally) I advise him that she has sprung from her "form" in the briars or sedge, but which is rarely held right (when a part-ridge (quail) is whirling rapidly off, we set out for new fields, hoping to find game more abundant. We got up but few, however, in a walk of several miles, and when we stopped for lunch, (we always call it "snack"), we had not exceeding eight birds. In the afternoon we found quite a number of coveys, and some very large ones (which were in fifteen ticks birds), but owing to the fact that the thickets in which they took refuge were very dense, we were placed under great disadvantage, and our bags were less swollen than we could have wished. Our entire day's hunt only brought us about thirty birds, beside several rabbits which Tom's special art had brought down. We reached our resting place after night, and, as usual, highly enjoyed the reception which awaited us.

The next day, facing a cold north wind, we set out for what was once, no doubt, a "lumpy hunting ground" for the pre-historic race, if one may judge from the existence of a mound having a base of about fifty feet, and an altitude of twenty, which is situated near the margin of Little River, in Montgomery county, about two miles beyond the Rich land. When I was a boy I thought this relic was the work of the Red Lords of the Soil, "monarchs" of the earth, but the researches of archaeologists seem to establish the fact that the people who did this unexplained work were of a rather higher type of civilization, and existed before the country was occupied by the "sons of Aiknemoak" or other chieftains of the Indian race. I confess I do not know what sort of people constructed this and similar "earthworks," and have not the slightest idea of the purposes which they had in view. To my mind, they had very little work to do or they would not have had time to pile up so much useless dirt.

And I am frank enough to admit that I am equally ignorant of the uses which this or some other people had for those elegant specimens of handicraft which are called discoids, several of which were found about seventy-five rods from the mound in the immediate neighborhood of this mound. I am aware that the high-learned, even now, before named, assert with great positiveness that they had exactly the same uses as the modern glass ball or clay pigeon, so called, except that the sportsman, instead of a two hundred dollar breech-loader used a spear, a javelin or an arrow, and shot at it as it was rolling. I trust I shall be considered as giving no unpardonable offense if I venture to suggest that such was the fact, they who indulged in the pastime had very poor ideas of economy, for even now, with all the modern labor-saving implements for working on stone, it would take an exceedingly skillful lapidary to make one of these discoids out of quartz in less time than a week. Then, when hatchets were of stone, "and other things according," it may be safely assumed that the manufacture would have required the labor of more than a month. To apply all this sweat of the brow in seeking a round stone, to be shattered at one cast of the javelin or flight of an arrow, would be evidence that the people who made them were entirely ignorant of physical economy, especially as a softer stone could be easily had, and out of which, even with rude tools, several could have been made in a day. Without further words upon the subject, I simply say that I regard the statement as entirely unworthy of belief.

As the mound is situated in a wooded place, with a hundred yards of it, and stopped our buggy at Tom's Ford. This day was to decide the long-pending contest between Teedel and Crickett for the champion belt. Like Balfour of Burley and Bothwell, as described in "Old Mortality," these two worthies were so intent in their purpose to succeed in achieving a personal victory that they did not regard Tom and me as worthy of their notice. With firm step and flashing eye they entered the list of contestants, and, as they stepped on the head, saying to him, "Be smart, master, and Teedel will give you good victuals to-night." At this suggestion I, as his subaltern only—his mere bird marker—talked puppy talk to Branch, and promised him, if he would stand up to Nip, I would give him a big bone of plain corn bread. Crickett successively fondled and flattered Kate, Jack and Jenny, and Tom only smiled his approval of the warlike preparations. And thus the contest passed, and the meeting only late in the afternoon. Teedel charged Crickett with preferring Tom to me, because T. rarely hit, and had so little confidence in his skill that he never claimed a bird that anyone else said he shot at, while my disposition was to claim every bird that fell. Of course it was a slander. Sometimes I do hit one, when no one else is near.

We turned to the left, going along the margin of the hills, which the local sportsmen call "the ridge," and the ridge we had not journeyed far before Nip was in that attitude which sportsmen regard as "glorious," with Branch "seconding the motion" in gallant style. T. was on the bird side of a small brook which I was unable to cross. The covey was flushed and each got in both barrels. He missed with one barrel, while I was more fortunate, and both claimed to have shot at another bird which fell. Here the score stood at one and a half to one each. Pursuing, we flushed one only, which both shot, wounding but not getting. The others flew up wild fully fifty yards off, and made good their escape. Going down into the bottom Nip again stood, my dog backing, and T. got two to my one. The other part of the covey we could not locate; so going on some distance, in a beautiful level field, Nip flushed a very large covey while going down the wind, and T. got a bird. The others settled along the side of a ditch near where we were, and waiting for my cue to come up, we both approached the covey. All the birds but three flew on his side, and he got one with each barrel; I had the same luck. He and I each got two more birds and wounded three others between us. Just before this we heard and saw the other "team" having a high time with a covey scattered in the stubble, but when we started our covey in such splendid ground, "high beat our hearts with hope elite," for we confidently expected the Elysian path to be so smooth, and so "chancing our route" in the direction of the ford where we left our buggy, we found several other coveys, but generally too close to covers.

It is sufficient to say that when our hunt ended and we counted our trophies, Teedel had seventeen and a half and I fifteen and a half—thirty-three in all. Two of them he killed before I joined him. He shot a 16 and a 12. Not long afterward C. and Tom walked up and called the Elysian path so smooth, and so "chancing our route" in the direction of the ford where we left our buggy, we found several other coveys, but generally too close to covers. It is sufficient to say that when our hunt ended and we counted our trophies, Teedel had seventeen and a half and I fifteen and a half—thirty-three in all. Two of them he killed before I joined him. He shot a 16 and a 12. Not long afterward C. and Tom walked up and called the Elysian path so smooth, and so "chancing our route" in the direction of the ford where we left our buggy, we found several other coveys, but generally too close to covers. THE TYRO'S FIRST "PARTRIDGE."—"Great Heavens, Charley! What Was That?"

[DRAWN FOR THIS "FOREST AND STREAM" BY W. H. McDUGALL.]

When it appeared that the contest was so close, C. tried hard to convince Tom that he was not entitled to one of the birds which he claimed, but he refused to make the concession. Crickett challenged to another trial, alleging as a reason that we found more birds than they, and had, of course, a better chance. To this "The Lieutenant-General to the Earl of Mar"—your correspondent—replied that if he had had Tom with him, his score, instead of being fifteen and a half, would have been fully twenty-two and a half. Nevertheless the two rivals met again not long afterward, and at the end of the day T. had eighteen and C. twelve. Still he is not satisfied, and the gauntlet is down again.

Now, Messrs. Editors, and especially the presiding genius over the dog department of the FOREST AND STREAM, I beg to ask a question: My dog Branch, a thick-set, white and lemon setter,

"Whose pawie tail, w' upward curl,  
Hangs o'er his hurdles w' a swirl,"

is one of the gamiest little fellows you ever saw. He is as active as an antelope—I never saw one, but am told they are "some" in the use of the legs—a splendid ranger, stanch as a dog ought to be, an excellent retriever, but he finds but few birds. He is lacking in self-reliance, and when hunting with another dog, seems to be content with acting the part of "second fiddler." His appetite is one of his distinguishing characteristics, and he has no special choice as to the quality of his food. Plain corn bread is his usual diet, and after having disposed of a large piece, he watches, with keen vision, to see if any of the others have left any of their rations. If so, he cleans it up, and then looks as if he was not half satisfied. Why does he not find the birds? Teedel says that his nose is hot, and that unless a dog has a cold nose, his olfactory organs are so insensitive that he is incapable of smelling well. His nose is hot, as a general thing. What must I do to reduce his temperature? Is he right in his assumption? Is a hot nose evidence of such physical disorder as impairs his sense of smell? Can the owner of "my dog Trim" answer this question of nosology?

With wind up of this medley I shall cease to trespass, until the *lunes veritables* again seizes me with its deadly fangs. When it does, your readers may get ready for another indication, and be prepared to read or skip some observations upon what I saw, heard and felt in other efforts to distinguish myself as a respectable disciple of Nimrod. WELLS.

ROCKINGHAM, N. C., March 27, 1893.

[A hot nose is generally to be accepted as evidence that the dog is out of condition. It is also the general rule that a dog with a poor nose cannot have a sharp scent. We have known exceptions to this rule.]

OSWEGO, N. Y., March 28.—Several flocks of wild geese have recently been seen flying north high over our city.—M. B. R.

## THE HUNTING RIFLE.

IN offering some remarks on this fruitful theme, I wish to be understood as referring strictly to the hunting rifle; and if I refrain from offering any "hints to novices," it is because that when I see a first-class "theoretical" rifleman miss a 700-pound moose at eighty paces, standing broadside on it, has a remarkably depressing effect as to the utility of said "hints." And again, if I gave any, they would differ so radically from those in the excellent series of articles by Mr. Van Dyke, "The Rifle on Running Game," that the bewildered novice would either lay down his rifle in despair, or take it up with a firm determination to trust in his own capabilities alone, which last is the correct thing to do anyway.

In the course of my hunting experiences, I have shot a good many deer on the run with the rifle; but I certainly never aimed ahead of any one of them. Neither do I know of a hunter in these parts who claims to have ever killed one in that manner, and I doubt if such a one can be found. If the animal's flight was continuous, like a bird's, the system of aiming ahead might answer; but as it comes to a dead halt at the end of every leap, to aim just ahead of that point and pull, will result in a miss to a dead certainty.

I confess to a feeling of admiration for Major Merrill's courage, if not for his discretion, in taking up the enguels for the muzzle-loader in preference to the breech-loader as a hunting rifle. The latter is so immeasurably superior in everything that makes up the conveniences of a hunting arm, that the battle is a hopeless one. Nineteen-twentieths of all my large game have been killed with a muzzle-loading rifle. So I speak from long experience; about the most bitter part of which was to shoulder my empty rifle and start for camp, through sheer inability to reload, with fingers frosted from contact with the histering steel barrel, the game standing in full sight, and the thermometer at -42°.

That the muzzle-loader is a little more accurate arm, I believe; but it is to be borne in mind that this superior accuracy depends on the proper use of the loading-muzzle, the guide starter, the swage and the balances; none of these are available in the hunting rifle, and so the superiority vanishes. When using the elongated bullet and loading the muzzle-loader in the woods with a common pocket starter, the chances of placing the axis of the bullet true with the line of flight, are decidedly in favor of the breech loader; the greater range and force of the muzzle-loader I believe to be wholly due to the greater amount of powder used, in proportion to the size of bore, and not at all owing to the mechanism. I believe our gun-makers make a grave mistake, when they enlarge the bore of our hunting rifles, instead of lengthening the barrel, and increasing the charge of powder in the shell. In regard to the two targets shown by Maj. Merrill, as the difference might easily have been in the marksmen instead of the guns, they prove nothing, and again, it is safe to say that if the owners of the muzzle-loader were to make half a dozen targets with the same

gun, over the same range, the difference between any two of them would undoubtedly be greater than that between the breech and the muzzle-loader; so that from the hunter's point of view it is merely accidental.

For a hunting rifle the Winchester has, until quite recently, been in my estimation a long way ahead. Its many merits, and its one defect, are getting to be pretty well understood among practical hunters; of the former are its shapely outline, its nice balance, excellence of workmanship, rapidity of fire, ease of manipulation, the beautiful working of the carrier-block being unapproachable by any other arm, and great accuracy within its range. Its one defect is its very high trajectory, and consequent lack of force, caused presumably by shallow grooving, slow twist, and bullet short in proportion to its diameter. Some two years ago I wrote the company manufacturing the above arm, respectfully representing that if they would put a different form of their gun on the market, one say of .38 or .40 cal., using 60 gr. powder, and bullet elongated sufficiently to be somewhat heavier than the one now used in the .44 cal., it would meet the wants of the hunters in this section and would, I felt confident, meet with a large sale. I received an equally respectful reply, stating that they were already manufacturing a 60 gr. Winchester, which was meeting with ready sale, and that they thought it would fill the bill. Six months after I saw in your columns the advertisement of the Martin rifle, ".40 cal., 60 gr. powder, 360 lead," caught my attention instantly, and I prevailed upon a friend of mine, who was about to order a new rifle, to send for one. Its superiority over my model 73 Winchester was so great that I disposed of the latter forthwith and purchased one of the new Martins. A faithful trial of it for the past year, including four weeks deer-shooting, in which I brought down the game at considerably over 500 yards, has fully satisfied me that it is by far the best hunting rifle for forest-shooting in the market, and as such I can confidently recommend it.

In sighting the hunting rifle, the front sight should be made as low as possible, by which I mean that the necessary elevation should be given by the block, and not by a high front sight. Therefore the ordinary knife blade sight is about the worst possible in forest shooting, because under certain conditions one always shoots "from the block," instead of the top of his sight, and if the former is far below the latter, the bullet goes clean over. What I mean is this: If the hunter, not dreaming that there is a deer within half a mile of him, on turning a corner, or a bush, comes instantaneously upon a deer in full view within twenty or thirty yards of him, he invariably sights from the top of his block instead of the point of his sight. Why this is so I will not even attempt to discuss. It requires years of practice, and great power of self-control, before one even becomes cognizant of the fact, and among those I have met who have discovered and acknowledged it, I never saw one who had overcome it. Bill Nye, a well-known hunter on the head waters of the Raquette, after, to use his own words, fighting against it for five years, knocked out his front sight, and in-

serted an ivory block with an inked groove down the center of the back edge, to guide his eye, and no sight at all on the top. As for myself, after losing a good many deer from an impulse which I tried in vain to control, I adopted a front sight, which I consider better adapted for cover shooting with the rifle than any I have ever seen. The following direction will enable anyone possessed of requisite skill in the use of tools to make one:

An iron or copper block should be fitted into the dovetailed slot in the front end of the rifle barrel, of sufficient height, so that when a fine sight is drawn over the top of it, the gun will not overshoot at any distance. The target should be simply a horizontal line half an inch wide drawn across a board or other material, say a foot in width. This should be placed at the distance from the shooter that he wishes his point blank to be—which for me is thirty paces. Then taking a careful rest and holding the top of the block even with the top of the line, and drawing a very fine sight, fire at the line. If the block is as high as it should be the rifle will shoot under. Now, without removing the sight, carefully lie down the top, trying it occasionally till the gun shoots into the line. Now remove the block, and with a nail, or half round file, cut a semi-circular groove in the top of the block, say 3/4 inch in depth; in the bottom of this groove saw the slot for the insertion of the sight; after carefully entering the saw, by slanting it to the right and left, the slot can be cut dovetailing. Each end should then be lightly reamed with a drill. A piece of coin silver should be used for the sight; this can be upset so as to fit the dovetailed slot, driven in from one end, and both ends rivetted so that it is perfectly solid, with the lateral movement of heat or solder. This sight should then be filed down till the straightedge shows it to be just as high as the top of the block. Now insert the block, and drawing a vertical line across the horizontal one on the target, forming a cross, aim at that, and drive the block carefully home till the bullet cuts the intersection of the cross. This sight will be found satisfactory at all times, except when the bushes are covered with snow, and then it is rather difficult to keep clear.

MAINE.

### THE GREAT DEER DESTROYER.

NOTICE the following paragraph going the rounds of the sporting press: "When the far-famed Oxford Gun Club take down their little rifles and start forth with blood in their eyes, the foxes turn pale in the woodlands, and the deer tremble upon a thousand hills."

I wanted to be a deer destroyer, and with the deer destroyers go, but they would not take me in. They said "I couldn't shoot a deer, any more than a hog could catch a clam."

When the great Gun Club came back from Rangeley, bringing home no pile of deer skins, no scalp of cunning fox, my soul was filled with gladness as the waters fill the sea. A little bird from the north land has whispered in my ear this true story which I tell:

The dying leaves, like wounded birds, were fluttering down from off the autumn trees, when first the great Gun Club pitched their tents by Rangeley's famous waters. One morn as the first, faint flush of coming dawn tinted the eastern skies, a man, with the matchless form of a Hercules, rose softly from under his blanket, and with a stop as noiseless as an Indian's when he walks the trail of death, passed out into the darksome woods. In his hands he carried a rifle, in his belt a little black bottle could be seen. It was the Great Deer Destroyer going forth to slay all the deer in Rangeley before his comrades should awake. As he strode swiftly along the forest pathway he chuckled and talked unto himself.

Now, his eye fell upon the surrounding hillsides, faintly seen in the early light. "Aha!" he cried, "ye hills eternal, your sides shall be dyed in deepest crimson with the life blood of the many deer my strong right arm shall slay." Now he stood upon the breeze-swept hilltops, looking down upon the early glory of the lake, stretching afar before him, lovely as an artist's dream of paradise. "Aha!" he cried again, "ye matchless inland ocean, your waters shall be dyed, your waves shall be dyed in the blood of the many deer, my never-failing rifle shall lay low in the throes of death. 'Aha! aha!' And he danced in wild joy upon the hilltop. "Aha! Behold me, great Sun! Look down upon me, ye gods of the morning. 'I'm the Great Deer Destroyer, just come up from the city of Death!'"

He came to a deep, dark, wood-crowned dell, through whose intermingling branches the sunlight never shone. As he stood in that dark depths, in the shadow and in the gloom, a great rushing and crashing fell upon his startled ear, like the rushing and the crashing of some mighty beast or prey, bursting through the scattering underbrush as a whirlwind in her rage. Nearer, yet nearer, that dread rushing and crashing came; it seemed to fill all the wide-extended forest, and the distant mountains caught and echoed back the dreadful sound. The Great Destroyer's face turned pale, his heart stood still with terror, his legs trembled and shook like trees in a gale of wind. Nearer, yet nearer, louder, still louder, the rushing and crashing came. It burst upon the affrighted Destroyer's ear like the crack of coming doom.

What was it? What mean those direful sounds?

Was it some terrible lion, snared on Africa's sands, who had broken its confining chains, rushed to the woods, and become the terror of the hills? Was it some still more terrible man-eater, from the jungles of India, who had burst asunder the mighty bars of iron which caged it, eaten up the circus of which it was the glory and the pride, and gone forth into the wilds of Rangeley to devour the sons of men?

Crash! crash! crash! It is almost on him now. The Great Destroyer became wild with terror. He ran to the east; he ran to the west; he ran to the north; he ran to the south; he ran in circles in the great dells, there, everywhere, so wild with terror he knew not what he did. And ever as he ran he cried: "Help! Help! Save me! Save me! What shall I do! What shall I do! I'm killed! I'm killed!"

Crash! crash! crash! on the very hills before him now. With a wail, despairing shriek, like the awful cry of a lost soul, he flung down his rifle and fled as never mortal fled before. Over fallen trees he leaped, over oozy pools he bounded, down the forest path he flew, swifter than ever fled the despairing deer before the howling hound.

Into the just-awakened camp the terror-struck Destroyer leaped. "Save me! Save me! Save me!" he shrieked; and then fell upon the ground and rolled over and over in an abandon of utter terror.

'What's up? What's the matter? Who's killed? So what

is it?" came from every side. "A-man-eating-tiger," he panted in gasp, "his-jaws—all-red—and-dripping—with the—life-blood—of victims slain—is hot—upon—my trail. Save me—save me—what shall I do—o dear—o dear—what shall I do—I'm—"

They didn't stop to hear any more. They just dropped dishes, preparing breakfast, rifles, everything, and climbed the nearest trees, as never squirrel climbed them since first the world began.

Long they waited; long they listened, but no blood-dripping tiger came. All was still. Gathering courage from the silence they came down from the trees. Picking up their rifles they began to trace back again the late flying Destroyer's trail.

Their faces were pale; their hearts beat quick; they carried their feet at full cock, but they saw nothing, heard nothing, save the song of the autumn birds, and the chirper of the happy squirrels as they leaped from tree to tree. Soon they came to the deep, dark dell, where, gleaming in the dim light, the rifle of the Destroyer lay. They must be close upon the man-eating tiger now. Down flat upon their bellies they crept like snakes up the hillside, keeping their eyes upon the best tree to climb. They reached the top; they crawled down the side.

They found the demon tiger's track. They rose to their feet and stood looking upon those dreadful tracks in a dazed and bewildered way. The Great Destroyer, his brain in a wild whirl, had followed in the rear, stumbling along over root and briar like one walking in a dream. He now came up. He looked upon those awful tracks, and if possible became paler than before. There, right before them, in the full glare of the morning sun, lay the tracks of that dreadful beast that had almost scared their lives away.

The tracks were the tracks of deer. The dread tiger, the awful demon of the woods, was a herd of deer going down to the river to drink.

For about five minutes the Great Destroyer stood as motionless and speechless as any stick or stone. Then, stretching his brown hands toward the sun, he cried aloud, like a man in more than mortal anguish: "Rise ye great lakes and rivers; rise ye woods and mountains; open earth and hide me forevermore from mortal eyes!"

O, how I would like to be a great deer-destroyer and with the deer-destroyers stand, and have a pretty, harmless, darling little rifle, and hold it in my hand. A. WARD, JR., OXFORD, MAINE.

### DUCK SHOOTING ON THE HUDSON.

LIVING as I do, on the banks of this beautiful river, I have an occasional chance to get a rap at the ducks on their flight north in the spring, of which I always take advantage; not that I make any particularly large bags, but there is something very charming to me to drift about among the colors of the ice, and to see a critter spring day, getting an occasional shot and an immense amount of enjoyment. Thinking it might interest some of your readers I give a description of a day's shooting I had in the vicinity of Croton Point on March 19.

The boat I used is something on the style of a Barneget-snek, only longer and narrower, being sixteen feet in length by three feet four inches extreme beam. Every thing is painted white, including the canvas screen flung on the ward deck and projecting about eight inches on each side to hide the short paddles which are used when after the birds. White jackets and caps, a fifteen-pound eight-bore hammerless Greener, and we are ready to start.

At six o'clock in the morning, on the day in question, I found my man and boat already. I had hoped to get off before anyone else, but was informed that two boats were already out. However, "better late than never," and soon we were among the drift ice. Unfortunately the wind began to blow, and we were obliged to keep under the lee of Croton Point. We made fast to a large cake of ice, and drifted along, keeping a sharp lookout. Finally comes a little grebe bobbing invitingly within gunshot and I am tempted, but better thoughts prevail, and I spare the little beggar. I am soon rewarded, for here comes a flock of black ducks, and I am in the midst of the flock of about five hundred yards away! I feared we could not get to them, as the ice was packed so closely, but we discover a lead, and are within one hundred and fifty yards, when bang! some one fires in the distance and up they all jump! Wicked words are uttered, but needlessly, for they alight again after flying but a short distance. Now we are getting very close, but so much do we resemble the neighboring cakes of ice, that we never raise their heads. "Here goes for a pot shot," but I can only get three together, kill two, and am fortunate enough to get another pair when they jump.

In picking up our birds we find that one has evidently seen a hard winter, as a chip hat would certainly disgrace him for weight. However, the other three were in very fair condition. After poking about in the ice for some time, I discover to leeward a flock of thirty or forty. As they are in open water, it is doubtful whether we can get to them, but of course conclude to try. When within about three hundred yards, part of them fly and the rest appear to be very uneasy. Another hundred yards and more take their departure, leaving only the redheads and a few pintails. Up get the latter, but we are going so fast before the wind that we are within sixty yards of the redheads before they rise. They swing to the left, and bang goes two successions of umbrellas shot, backed up with eight drams of powder. Down come four; long again; burrah, three more! Now the fun begins. Some are crippled, but a few more shots and they are all mine—seven beauties!

I conclude after this, that we had better pull back to the point, as it was beginning to be pretty rough. My man Andrew was of the same opinion. We were almost ashore when what should I see but an old drake whistler coming straight for us. "Down!" I whispered, I seized my gun. Andrew drops his oars and we crouch in the boat; at a very lively rate he comes straight ahead. As soon as he is in range, I jump up—he sneers off and I put in ahead about four feet and make a colander of him. He falls beautifully. What nicer shot can a man have than a duck flying from right to left at an angle of forty-five degrees, providing said duck is his gun in the right spot.

There is a pair of ducks over toward Caw-Buckey Point," says Andrew, "shall we go for them?" Well, I should say so; closer inspection shows us that they are widegown. We got up to them nicely, they jump, miss the first, by hokey! but settle the second.

After this we see nothing for a long time, conclude to

land, and I take a most delightful sun-bath under the lee of an old fish-house for at least an hour. Finally the wind dies away, we get in our boat and row for the channel. We see a flock of black ducks all asleep, and just as I am counting on a telling shot one veteran pokes up his head, sees us, and away they go. I let drive and cut down a pair, which is a sheer piece of luck, as they were too far away; but today is one of my lucky days.

This last shot winds up, and we return home tired out, but with fifteen fine birds. I seldom have this success, but always have a thoroughly enjoyable day.

F. BRANDRETH.

SING SING, MARCH 29, 1888.

### THE OTTAWA CONVENTION.

AS it was evident that such an important event as the dog show would call together large numbers of sportsmen from all parts of the Dominion, advantage was taken of the occasion to call a meeting to consider several of the very important questions arising out of the violation of the game laws and prevalence of pot-hunting. The meeting was held in the City Council chamber, which was placed at the disposal of the sportsmen for the occasion. There was a large attendance, among those present being many who were regularly delegated to attend to represent either some sporting club or some section of country. The following were among those present: Mr. O'Brien, M.P., Muskoka, representing a meeting of sportsmen at Gravenhurst; W. F. Whitcher, Commissioner of Fisheries; J. M. Forsyth, Wolfe Island; J. B. Walkem, Portsmouth; Capt. Campbell, St. Hilaire, Quebec; Dr. Hurlbut, F. J. Boswell, J. D. Paterson, G. Goun, C. Goun, Ottawa. Sheriff Sweetland and A. W. Thrope acted as secretaries.

In opening the meeting the chairman called attention to the thinning out of game by pot-hunters, many of whom lived outside of the Dominion, and explained that it was hoped to reach some means of putting stop to this slaughter. He felt certain that the Government would give great weight to the opinions of such a large meeting of representative sportsmen. The next speaker was Wm. P. Lett, City Clerk of Ottawa, and a prominent sportsman of many years standing, who in the name of the sportsmen of Ottawa extended a hearty welcome to their friends from a distance. He gloried in being a sportsman, even though some might say sporting inclined was a relic of barbarism. His work of welcome was responded to by Herbert C. Jones, of Winnipeg, who thanked the sportsmen of Ottawa for their reception, and while on his feet took occasion to advocate the formation of a Dominion Sportsmen's Society to promote the protection of game.

Dr. J. T. D. Mackenzie illustrated the importance of systematic attempts to protect game by a reference to the case of his own country, Addison, N. B. He told of welcome by saying that he had hunted in the county for a number of years, he stated that American "pot-hunters" were killing out the deer and partridge which used to abound in the county. In a single train last fall he had seen thirty-one deer carried out of Canada to be sold in the States. Four years ago he traversed the county on foot, and by the beaten road shot five partridge. In traveling the same road no partridge were to be met, but boys armed with old guns were to be met at every turn, who would tell you that they were making men's wages in killing partridge, which eventually found their way to the New York markets. The remedy for all the destruction of game, he continued, was to prevent the exportation of game. He hoped that the meeting would confine its attention wholly to the point that night. Ontario had a fairly good game law. It was then moved that a short act passed by the Dominion Government to prevent the exportation of game. They should be able to do this, and such an act, if passed, would do a great deal toward saving the game of the country from "pot-hunters."

Judge Jillett advocated the stoppage of spring shooting, and a motion was carried to that effect as given below.

Mr. Lett submitted a motion urging the Dominion Government to pass an act stopping the exportation of game from Canada.

Mr. O'Brien, M. P., spoke very emphatically in favor of such an act, and advocated the necessity of officers being appointed by the Sportsmen's Association to enforce the law. He stated that over 1,300 carcases of deer were taken out of Muskoka by the Northern railway during the season just closed. However, he thought it might be going too far to stop exportation all through the season. He would suggest that the exportation should be made illegal only after some date in November, so that American sportsmen, who really come for sport, could kill deer and send home one occasionally. The comparative warmth of the season up to November would, he held, prevent "pot-hunters" taking advantage of such exception in the law to send deer to market in large quantities.

Dr. Hurlbut opposed making any such exception in an act as that proposed. It would leave an opening through which a coach and four might be driven. Otherwise he would be heartily in favor of a preventive act.

Mr. Gill, of London, spoke of the work of the Fish and Game Protection Society of his district, and stated that they hoped shortly to effect something satisfactory, as they had arranged to co-operate with the societies of Hamilton and other places. He referred to the rapid destruction of game throughout Ontario, and hoped that such an act as that under discussion would be secured.

Mr. Shaw, of Perth, emphasized the destructive effect of pot-hunting in Lanark and indorsed heartily a Dominion act to stop the exportation of game. But the Ontario act rendering illegal the exportation of dead deer was a dead letter, because there were no officers to enforce it, and if a Dominion act were passed, it, too, would be a dead letter, unless rangers were appointed by the Sportsmen's Association to enforce it.

Dr. McKenzie remarked that if the Dominion would pass the act desired it might also provide to intrust its enforcement to the customs revenue officers, which would settle the matter.

An amendment was here offered embodying the exception to the proposed act mentioned by Mr. O'Brien, but the

amendment was eventually withdrawn, and the motion carried to the effect given below.

A warm discussion arose on the question of attempting to legalize the hunting of deer during the open season, with the assistance of hounds if desired, but the question was eventually dropped. The convention then adjourned with the understanding that the committee appointed to obtain a Dominion act preventing the exportation of game should meet the next morning. The following were the resolutions adopted by the meeting:

**First Resolution.**—Moved by Judge Jellett, seconded by Mr. Lett, that the Ontario and Quebec Governments be petitioned to amend the game act as at present in force in the Provinces, so as to prevent spring shooting entirely, and that the close season for ducks of all kinds, geese, swans, ducks, etc., be from January to September 1 in each year in the said Provinces.

**Second Resolution.**—Moved by W. P. Lett, seconded by Dr. Mackenzie, that the Dominion Government be asked to prevent the exportation of game of all kinds from the Provinces of Ontario and Quebec, and that Col. Straubezie, Mr. Weagant, Dr. Mackenzie, Mr. O'Brien, M. P., Judge Jellett, Mr. Dill and Mr. Gill be appointed a committee to wait upon the government for the purpose aforesaid.

On the following day the committee waited upon Sir Leonard Tilley and Hon. Mackenzie Bowell. The Ministers were asked to use their influence with the government so that the necessary steps should be taken for the protection of game and the exportation of it prohibited. The question will be submitted to the cabinet at its next meeting.

## LAST WORDS ABOUT THE SCREED.

Editor Forest and Stream:

I admit that I did intend to ridicule some of "Nessmuk's" ideas and arguments when I wrote "Another Screed." I mean to show, by arguments somewhat similar to those by which he proves that no deer is worth \$25, that the value of many other things usually thought valuable is purely imaginary. That is, or was intended to be, the point of my remarks. The absurdity consists in attempting to fix the value of a class of objects by *a priori* reasoning—preferring theory to facts. For the plain fact is that some dogs are worth a great deal more than \$25, and no argument is of any value in opposition to the fact.

A thing is of value fairly being; and the scarcer an article is the higher price it will command. There are elementary principles, and are familiarly illustrated by the cases of pictures, diamonds, choice city lots and gold. "Nessmuk" himself says that if the civilized world has agreed to receive gold at a certain price, neither he nor I can reverse the decision. Very well. Now, let him apply the same principle to pictures, dogs and horses. The best of them are scarce. They are not to be had by people of moderate means, but it does not follow that those who can afford to, and do have them, are to be stigmatized as "fortunate fools with more money than brains."

It is a little cool in "Nessmuk" to charge me with flippancy in assuming that he would value a painting according to the cost of the property it represents. Probably he has forgotten that he wrote, "Is a counterfeit presentment, then, worth more than the original?" I don't wonder he is disgusted and disowns the idea, but I shall certainly not forget it. Without his suggestion, it never would have occurred to me. Neither should I have thought of including gun-barrels (the work of artisans, not of artists), artificial flies, or, for that matter, Prang's chromos, in the domain of high art.

I leave the matter here, not thinking it necessary or worth while to reply to "Nessmuk" in any greater detail.

MARCH 29, 1893. PICKET.

**INDORSING THE MAINE COMMISSIONERS.**—West Medford, Mass., March 25, 1893.—*Editor Forest and Stream:* The annual meeting for the election of officers of the West Medford Shooting Club was held on Monday evening, March 26, at West Medford, Mass. There was a large attendance, and much interest in sporting matters was shown. The following gentlemen were elected: President, Chas. H. Parker; Vice-President, E. F. Kakas; Treasurer, J. E. Ober; Secretary, W. P. Morse; Executive Committee, J. A. Rockwood, E. G. Morse, F. O. Brown. The recent indictments in the State of Maine, for the violation of the game laws of that State, was the principal topic of the meeting, and the following resolution, submitted by the secretary, was unanimously adopted. It was voted that a copy should be forwarded to the Fish and Game Commissioners of the State of Maine: *Whereas*, The members of the West Medford Shooting Club of West Medford, Mass., are interested in the preservation and protection of the game and fish of the several States of this country as well as the State of Massachusetts; and *Whereas*, The fundamental principles upon which this association was organized are for the advancement and diffusion of those principles and practices of game and fish protection, be it hereby *Resolved*, That the club extend to the honorable Commissioners of Fish and Game and to the sportsmen of the State of Maine a vote of thanks for their successful endeavors in securing an indictment of some of the law breakers and "pot-hunters" which infest that State, and further hope that a speedy conviction will be followed by the infliction of the highest penalties the laws of the State allow.

**GUINEA FOWL AS GAME BIRDS.**—Stewarts, Hale County, Alabama.—Last fall I was training a young pointer dog, and went into a field where I knew there was a covey of quail, and upon getting into a thicket some distance from where the quail frequented, my dog came to a point. I thought I had a covey of quail there sure, and made ready for some sport, when upon approaching the dog the guinea fowl, some fifteen in number, made flight and scattered as prettily as I have ever seen game birds. I tried to get several and he pointed them well as he flew his quail, and they keep close until you scare them up. I was so much pleased that I have made arrangements to turn loose fifty of the birds in my fields. There will be considerable danger of hawks, fox and wildcat catching them, but they are a very prolific bird, and I believe they will raise in our mild climate to perfection. I heard a gentleman say yesterday he was going to get some and turn loose on his farm, as the negro will not let them be shot. By the way, the negro destroys more quail with us than the regular hunters do. —G. B. S.

**SNIPE IN NEW JERSEY.**—Philadelphia, April 3, 1893.—English snipe are in Cape May county, N. J., I. Jerrell, at Seaside, killed the last of the past week, twenty odd on the fresh marshes inland at that place; the birds were poor. —Homo.

## MICHIGAN'S MANY BILLS.—East Saginaw, Mich., March 8.

—At every session of the Legislature there are a number of bills introduced relative to changing the game laws of this State, and this year has proved no exception. Some of these proposed changes are good and in the interest of game protection, and for the good of the people of the State, but a number of them are of an opposite nature and purely in the interest of market hunters and outsiders, who, until the past year or so, have been in the habit of coming to this State in the fall and staying all through the season, killing immense quantities of game and shipping it to New York and Boston markets. I will name the titles of the different bills so the public can see for themselves whether action should or should not be taken to prevent the passage of a number of them. House bill No. 25, prohibiting the use of a battery in shooting ducks, has passed the House and will pass the Senate. In the hands of the Committee on State Affairs in the House there are no less than fourteen bills. House bill No. 259 proposes to change the open season for shooting deer to fifteen days later at both ends. House bill No. 312 proposes to repeal act No. 151 of session laws 1881, which prohibits shipment of deer, partridges, etc., from the State. (This bill has saved more deer in the past two years than all the legislation on the subject heretofore.) House bill No. 475 removes the protection from cherry birds (a good thing, but it should include robins and English sparrows.) House bill 387 prohibits hunting of deer. House bill 311 changes the open season for deer to one month later at both ends; also prohibits hounding. (Take this in connection with House bill 331, and the market hunter would have a glorious time of it for two or three years, by which time the deer would be cleaned out of Michigan forever.) House bill 343 proposes to extend the open season for deer fifteen days; House bill 329 shortens the season for deer killing in the Upper Peninsula, and prohibits shipments of game therefrom; House bill 340 prohibits the killing of quail for three years throughout the State; House bill 297 prohibits hounding of deer; House bill 423 prohibits the killing of prairie chicken for three years in Livingston county; House bill 237 prohibits the use of ferrets in hunting rabbits; House bill 549 protects ducks in the spring. (Proposed by the Michigan Sportsmen's Association.) House bill 560, making the amount of fine from \$10 to \$50, at the discretion of the justice. (This is a Michigan Sportsmen's Association bill.) House bill 561 makes the possession of game out of season illegal, unless the accused proves that it came into his possession lawfully. (M. S. A.) There are also a number of bills in the hands of the Senate Committee, but as yet no action has been taken. One of them provides for the appointment of a State game and fish warden, whose duty it shall be to see that the game laws are enforced. This is the most important bill of the entire lot, and certainly should be passed. —W. J. MEMSTON, Secretary Michigan Sportsmen's Association.

**RESTOCKING THE GAME GROUNDS.**—Philadelphia, March 31.—There have been some snipe on the meadows about Philadelphia, notwithstanding the wintry weather of the past week. From Delaware and Maryland the poultryers are receiving quite a number of birds. The Pittsburgh Sportsmen's Club have liberated a number of Tennessee quail in Chester county, Pa. This, with other work this comprising society is doing, will be felt in Northern Pennsylvania. The New Jersey Game and Fish Protective Society, not to be behind its sister association, have ordered a large number of birds from the West for stocking the lower counties of their State. The first lot of nearly four hundred, which came from Indian Territory, will soon be planted. —Homo.

**CAPTURING GROUSE ALIVE.**—Troy, N. Y., April 1.—In your edition for March 29, I read "Falcon's" article on capturing a grouse alive. Last spring while out in the woods with a friend after hawk's eggs, I flushed a ruffed grouse which flew only a short distance and lit on a stump. As I approached, it jumped to the ground behind the stump. I expected to see it rise when I got near enough, and I kept on tramping ahead; but no grouse rose, and I thought I would investigate. The stump was hollow, and underneath it there was a hole into which I thrust my arm and drew out a full-sized unharmed male grouse. Yielding to the entreaties of my companion I let it go. —TAXIDERMIST.

It is pretty well settled now that the very early bird doesn't come after the worm; he comes before it. And by reason of this very previousness, he gets left right along year by year. It is one of those *lusus nature* in which the bird loses his nature and nature in return loses a bird. Amid the rough and tumble of the February and March weather, the early bird appears now and then each year a soft and balmy day. Its sky is gentle, the faintest of sweet odors are in the air, and the south wind that brings them whispers through the leafless trees the promise of the coming summer. It is a welcome sound. In such a day and such a time, when I get near enough, and I keep on tramping ahead; but no grouse rose, and I thought I would investigate. The stump was hollow, and underneath it there was a hole into which I thrust my arm and drew out a full-sized unharmed male grouse. Yielding to the entreaties of my companion I let it go. —TAXIDERMIST.

There is a gentleman in this city who has been training an intelligent dog to pick up money and coin when dropped. The animal took very kindly to the trick and proved very successful in retrieving bank notes. Moreover, the dog distinguished between the money of his owner, and nothing could be learned of his whereabouts. At the end of twenty-four hours he reappeared with two one-dollar bills in his mouth. The question now is, "Where did he get the money?" —Norwich (Conn.) Bulletin.

## Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

**ANGLING RESORTS.**—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

When the lawyer is swallowed up with business, and the statesman in pre-arranging or contriving plots, then we sit on cowslip banks, hear the birds sing, and possess ourselves now and then in such quietness as these silent silver streams we now see glide so quietly by us.—Frank Walton.

### THE BOY ANGLER.

UNDER the bridge that spans the stream,  
Stream that gurgles and prattles away,  
Stream that dashes with many a gleam.

The boy would pass the holiday,  
I wonder if ever in all the earth  
A happier heart warm'd human breast:  
If ever such perfect, such rapturous mirth.  
Was known as in that Eden bled!  
I wonder if ever a gorgeous king,  
In midst of all his jewell'd court,  
Royal with sceptre and crown and ring,  
Had ever such rich, ecstatic sport.

The bridge was ancient with log and beam,  
And over it droop'd the willow trees,  
Dipping their catkins in the stream,  
Asylum for fluttering birds and bees:  
And here in his dim, secluded cave,  
The boy would come to muse o'er the wave.

He mused, for he lov'd all beautiful sights,  
All sounds delicious that charm'd the place;  
The insects gay, small water sprites,  
That skimm'd and circled in lazy race;  
The water-weed flitting there,  
The blue kingfisher, perch'd on spray,  
Then dropping quick from leafy law,  
Shriek-screaming as he seiz'd his prey.

And here the poor, barefooted boy,  
With tatter'd jerkin and hat of straw,  
Enjoy'd the bliss, the perfect bliss of rest,  
The angler's rapture, without a zest.  
He watch'd the minnow's quivering fin,  
And silvery perch go swimming by,

The sunfish darting out and in,  
The pickered snap at the gaudy fly,  
The little shiner, like diamond spark,  
Shoot through the waters deep and dark,  
And the trout, like glancing Indian shaft,  
Deying even his cunning craft.

It was a pleasure to note the frog  
That sat open-mouth'd on weedy log,  
To note the turtles, all speckled o'er,  
Bask on the slippery rocks of the shore,  
The muskrats paddling in sluggish play,  
And mink and the otter on their way.

It was pleasant when hot, midsummer days  
Scorch'd earth and air with feral breeze,  
When the very atmosphere seem'd to swoon  
With the drowsy influence of the noon,  
To sit in his hermit cell and hear  
The voices of nature in the air;  
The chirp of the cricket in the grass,  
The snap of the grasshoppers as they pass,  
The anthems of song birds in the hedge,  
The whistle of snipe across the sedge,  
And all the entrancing symphonies  
Of breeze and of wave, of birds and bees—  
All paintings of nature's matchless art,  
All music of nature that thrills the heart!

ISAAC McLELLAN.

## BASS ISLANDS OF LAKE ERIE.

IN reply to your inquiry for angling resorts, I mention the bass islands of Lake Erie, near Sandusky, O. There are three or four slated headquarters, viz., Ballast Island, Put-in Bay, Kelley Island, etc., each one within a few miles from the others, near the shores of which are usually to be found good bass fishing in the season. And then for very fine sport, large and gummy fish, to be had in catches of twenty-five to one hundred for a day's sport, are well-known reefs and other small and uninhabited islands. These are easily accessible by small rowboats, sailboats, or steam yachts, for a day's fish, starting from some headquarters in the morning and returning in good time for a social evening at home.

Ballast Island, one of the most beautiful of the group, a small islet of about fifteen acres and situated about the center of all the principal fishing grounds, is owned by a few Cleveland gentlemen, fitted up with fine accommodations in the way of cottages, dining hall, etc., and though a private club, is kept on the "open order," and any party of gentlemen, or with ladies, will be welcomed and finely cared for during the bass seasons by the superintendent, Jno. C. Brick, whose place of abode is Ballast Island, O., via Sandusky, O. At Put-in Bay and Kelley Islands are fine hotels, whose landlords know how to provide for the "inner man," especially if he be a fisherman.

These islands can be reached from Sandusky, Toledo, or Cleveland, O., by steamers; those from Sandusky running daily from early spring till late in fall, and requiring a run of from one to two hours only.

The seasons begin usually about May 10 in spring and September 1 in fall, lasting about a month. Expenses are from \$1.50 to \$2.00 per day, or \$10.00 to \$12.00 per week, for board, and about \$2.00 per day for boats, oarsmen and minnows, per man. Where steam yachts or sailboats are chartered for a fish at some of the more distant grounds, by parties, usually costs about \$1.00 each per day for that in addition.

The bass are always gummy, and range in weight from 2 to 5 pounds—generally an average of 3½ pounds—and there is no better bass sport to be found than in the waters of Lake Erie and among these islands. —G.

CLEVELAND, O., March, 1893.

## WALL-EYED PIKE OF THE GENESEE.

I READ with great interest the notes of correspondents on wall-eyed pike in FOREST AND STREAM of the 29th, and as the fish is well known and much sought by anglers in this vicinity, I offer a slight contribution to the general fund of information on the subject.

I have been fishing for them with more or less persistence from schoolboy days until the present, or well nigh twenty years, and have had average success. Older anglers tell me that the fish were formerly more abundant than they have been of late years, and that long ago there was no difficulty in taking them by the dozen with hook and line, where it is not easy of late to get a "strike" at all. The only water near this city in which they are taken is that part of the Genesee River between the lower falls and Lake Ontario, a distance of about five miles, and nearly all the fishing is done within a mile of the falls. The water is from six to fifteen feet deep, and has a rough, rocky bottom, on which there must be a ton of leaden sinkers and miles of fishing line lost by contact with the boulders.

I have never known any pike to be caught here except during the months of April, May and June. When the snow melts early and the water in the river becomes clear in April, some of the more enthusiastic anglers venture to try for pike in April and are occasionally rewarded by a large fish, for it is believed by the fishermen that three varieties of pike come up the Genesee. In April and May a large, dark-colored fish, denominated the "blue pike," is caught; their weight is as high as ten pounds. After they disappear it is the golden-bellied, or yellow pike, succeeds to the dominion of the waters. This fish is generally from two to six pounds in weight, and some have been taken which the spring balance would weigh ten pounds. I do not pretend to give the weight of the big fish which everyone loses just as it is about to be lifted in the boat, but some of my acquaintances have told me, and no one doubts a fisherman's word, that they have hooked and played pike near the island waters, to judge from their visible dimensions in the water, could not be an ounce under fifteen pounds. These big fellows, I am sorry to say, always broke loose just as their would-be captors were inserting their fingers in their gills. May and the first half of June are the season for the yellow pike, and after they stop taking the hook a small fish called June pike by local anglers puts in an appearance in large numbers. They seldom exceed two pounds in weight and are of a gray or leaden color, differing materially in appearance from either the blue or yellow pike. I have known one of any kind to be taken with a hook later than June, but until July 1, if the season, including water, temperature, wind, etc., is favorable, one may chance to catch a dozen or more in a few hours.

Seth Green used to fish here and could tell you, I presume, of good sport (Seth is just now recovering from a very severe attack of pneumonia, which prostrated him soon after his return from the South, where he was sporting for several weeks with Robert B. Roosevelt). Jacob A. Hooker, city editor of the *Morning Herald*, has cast many a line in the pools and knows what it is to bring home a big string of pike. He and a friend from "Sweet Country Cork," T. W. A., were the first ones I ever knew to fish for pike with a spoon hook, and they caught half a bushel full one afternoon. They trotted deep and baited the hook with a strip of fat pork. Until I heard of their hook I had followed the plan which custom prescribed, viz., use a single hook with a strip of crimson cloth tied a few inches above the hook, half a dozen common earth worms wiggling on the barbed steel, and a three-ounce sinker fifteen inches above the hook. I have since tried the spinning or spoon hook and prefer it. The current of the river runs from three to ten miles an hour where we look for pike, and one person must give his whole attention to keeping the boat in position, moving up and down or across the current of the stream, where experience has shown that the pike most do congregate.

The best hours for fishing are from sunrise until about ten o'clock, and from three P. M. until sundown. The river is from thirty to fifty yards wide, and on a pleasant day during a good season ten to fifteen boats can be seen on the fishing ground at once. It is a rather romantic spot for angling, as the banks of the river ascend over a hundred feet and abundantly furnish the angler with all the elements of the wicked "small boy" to stand on the bank above and endanger the angler's life by pelting him with stones. Prudent fishermen sometime carry a revolver for the purpose of intimidating the festive youth overhead, but apart from this source of danger the contemplative fisher meets with nothing to disturb him.

I presume that trained ichthyologists will smile at my classification of this pike, but they are welcome to do so, for I make no pretense of knowing anything about fish, and scientifically and merely record what I have heard. None of our pike make a good fight.

MCS.

ROCHESTER, March 31.

## WALL-EYED PIKE.

I HAVE read with considerable interest the views of several correspondents of the FOREST AND STREAM in regard to the wall-eyed pike, or pike perch. As this is one of our most abundant fishes in this section of the country, what little I am able to say may interest some of your readers, and at this season of the year, just before the break up here, perhaps I can be a little more liberal to the wall-eye in my views, than I otherwise would be after having captured hundreds, and the longing and excitement had some what subsided.

The peculiar nature of the country here in the great park region of Minnesota furnishes splendid opportunities for fishing. The many beautiful lakes and swift running streams keeping the water clear and cool seem to just suit the wall-eyed pike, for they are found in great numbers, and large fat fellows they are. There seem to be several branches of the family, for some are very light colored, while others are equally dark. In the spring of the year, as soon as the water begins to flow into the lakes from the thawing of snow, the pickerel or grass-pike begin to run up the stream to spawn. In a couple of weeks, say about the first to the middle of May, the wall-eyes follow and then great numbers are speared. Everybody has a spear in this country, from the ten year old boy to old men. No mercy is shown the fish, but wagon-loads are carried away every day, and there is no law to protect them and bar this wholesale slaughter. No idea can possibly be given of the immense numbers that are found in these small streams from April to June.

The Pelican River lies just south of this village and drains many of the largest lakes in the park region. It is about

twenty feet wide at this point, and averages perhaps a foot or two in depth. The bottom is hard and gravelly and the water is clear as crystal. The fish run so thickly here that a boat descending the stream in spawning season drives the fish ahead in such numbers that a wave is raised by them often a foot in height. This is a common occurrence and can be seen at any time during the months mentioned above. After the spawning season is over the fish retire to the lakes again, and then the rod and reel come into active use. As I said before the pike is one of the most common fishes here, and in fact I think it is the most common fish of any other one of different varieties. They are not the best biters by any means, but whether it is from the good living they find or their natural disposition I am unable to judge, and would like to hear how they act elsewhere. Certain it is that in the opening of the season they bite much better and harder than later on. I have never seen them taken with the fly in these waters, but I think they could be very easily, for I have seen them strike directly out of the water for insects, time and again. I have also drawn a baited hook swiftly over the surface and had them dart up at it, and have sometimes secured them in this manner. The common mode of fishing for them here is with a heavy bait in the deep water. They take it very quietly, and you seldom feel them on the hook until you begin to pull up. The way you generally find that you have a fish is to see your line move off at an angle—a pretty sure sign that the end of the hook is occupied. Occasionally you receive a good hard strike, but it is a rare occurrence with the pike.

The black bass are also very numerous here, and some of the finest specimens I have ever seen have been taken. Four-pounders are of common occurrence, and some run even as big as six and six and a half pounds. They strike very well, and it is always an easy matter to tell whether a pike or bass is tug-ging at your line. For my part, I like the flesh of the pike much better than the black bass in this locality. The meat is finer, harder and of a clearer color. Of course, all have their preference, but I think this is the popular opinion among the fish-eating community here.

I have fished considerably in different parts of the country, and I believe that in no part of the West are such fine catches made as are taken here. A prominent Indiana sportsman, here last summer, says he has fished in the waters of nearly all the States and Territories, but never saw anything that equalled our fishing here. He went out with a party of three, and after fishing till 1 P. M., but twenty fish were taken. They then moved along some distance to the inlet of a good sized lake. Right at this inlet there is a small bay, ten feet square, with the water quite deep and still. A strong wind was blowing directly in from the lake, and rolled the waves up well. The fish under these circumstances always congregate here in large quantities. In one hour they had increased their string from twenty-five to one hundred and thirty-seven. Nearly all were wall-eyed pike, with several bass, pickerel, etc. They stated that their hooks hardly touched the surface of the water before they were taken, and a fish or two were swinging in the air continually. It took the breath clear away from the gentleman from Indiana and he made the statement referred to above.

I have seen still better catches from the waters of the State of that of a party of three, who spent a whole day on Detroit Lake without weighing anchor. They took over three hundred fish, two-thirds wall-eyes. The wall-eyes alone filled an apple barrel to overflowing, and a large box beside.

Of course all this fish slaughter is useless, but while the fish do bite the fishers will fish, at least until our Legislature passes laws to regulate the matter. I have seen a party getting off for a day's fish are bound, ten to one, to give up with each other to see who can make the greatest haul. Now I have told what I know about the wall-eye here and should like to see other readers of the FOREST AND STREAM come up and state what they know. One thing I can assure all sportsmen. If they want a pretty, quiet place to spend the heated season, where sufficient fish and game is found to insure good sport, they had better come to this place. I am pleased to state that this season will witness ample accommodations for all, and I would be pleased to give detailed information to parties inquiring. Below I give you a synopsis of the game law passed by the late Legislature of Minnesota: Ducks from the 1st of September to the 15th of May, prairie chickens and grouse from the 15th of August to the 1st of October, partridges, pheasants, etc., from the 1st of October till the 1st of January. The duck shooting season has been extended from the 1st of November to the 1st of December.

H. P. HAMILTON.

DETROIT, Minn., March 25.

PHILADELPHIA ANGLING NOTES.—March 31.—There is a poor outlook at present for our trout fishermen who resort to Pennsylvania State as soon as the condition of the streams after the opening season, April 1, permits. No one as I can find out will attempt a trip now, as the mountains are yet full of snow, and this will have to disappear and run off before fishing will be worth trying. The backwardness of the season has caused the coming of the shade up the Delaware late this year. Many gilling skills have started down the bay and are already fishing there. All that is wanted is a few days of warm, spring-like weather, and the shade will run. Big preparations for the season are being made at Gloucester and Howell's Cove fisheries.—HOOB.

NEW HAMPSHIRE TROUT SEASON.—Franklin Falls, N. H., April 2, *Editor Forest and Stream*: In your leading editorial of March 28, you have mentioned the season of brook trout as commencing April 1 in this State. By referring to FOREST AND STREAM of December 7, 1892, and also to "Fish and Game Laws of the State of New Hampshire" I find that the close season is from September 30 to April 30. I direct your attention to the above as you may mislead some of our more ardent (or verdant) anglers. Trout fishing here, at present, could be neither pleasant nor profitable, owing to the great amount of snow which still remains, an average depth of about two feet.—H.

ROUTE TO THE NEPION.—Will some one of your readers who "knows the way" to Nepigon be so kind as to inform the writer through the FOREST AND STREAM of the shortest time route to Nepigon from Chicago, and what the time is? Also, how far must one ascend the river to obtain good trout fishing? By so doing he would much oblige one who would like to know.—ANGLER.

AS WE GO TO PRESS we learn of the death of Mr. William Mills, senior partner of the firm of William Mills & Son, dealers in fishing tackle, 7 Warren street, New York.

## THE TROUT DISPLAY.

THE new Fulton Market was in gay attire on Monday and Tuesday last, and trout and roses were there in profusion. Mr. Blackford had a display that in some respects exceeded and in others fell behind his efforts of former years. It exceeded former displays in the matter of the number of large Western trout and the introduction of electric lights in the tanks of live fish, while it fell behind in the number of private exhibitors. Canada was well represented by a great quantity of wild trout, which were in good condition, much better than in former years. They were long shapely fish, very dark, and with bright red bellies. A pair of Canadian "sea trout" attracted much attention, and anglers disputed as to their being *fontinalis*, as the large specimens lose their crimson spots in salt water. Brook trout from many parts of New York State, Rhode Island, Connecticut, Massachusetts, Minnesota, Pennsylvania and Vermont graced the tables and nestled in the moss divisions which separated them. The South Side Sportsman's Club of Long Island sent many live trout which showed well in the evening by the electric lights suspended in their tanks. They were startled by it at first, but gradually lost fear of the strange brightness.

## RAINBOW TROUT.

The display of the rainbow trout (*S. irideus*) was the best ever made in the East. Six specimens, ranging from eight to sixteen pounds, stretched their lengths on the slabs and looked rather like they were. These specimens were taken in Paper Mill Creek, Marion county, Cal., and were not as bright as some smaller specimens sent by the U. S. Fish Commission from the salmon breeding ranch at Baird, Shasta county, Cal. The pair of live rainbows of two and a half and three pounds, raised from the egg by the South Side Sportsman's Club, attracted much attention; their dusky spotted sides, red central lines and brilliant opercles enabled the most careless observer to decide that they were of a different species.

## THE MINNESOTA FISH COMMISSION.

The Minnesota Commission sent from their State hatchery specimens of California salmon, brook trout, landlocked salmon, lake trout and hybrids, wall-eyed pike and yellow perch. The specimens ranged from half a pound to two pounds, and were in good condition.

## DOLLY VARDEN.

A single specimen of the Dolly Varden trout, *Stizostedion malma*, was sent by the U. S. F. C., and greatly interested fish culturists. The fish would weigh about six pounds and it was spotted with large crimson dots all over its sides and high up the back, and is no doubt a beautiful fish when fresh from the water. It is rare in its own country, and fish culturists have not yet succeeded in obtaining its eggs. No doubt it will be a valuable acquisition to our Eastern game fishes when once introduced.

## EMBRYO FISH.

In the glass hatching jars on Mr. Blackford's tables were infantile specimens of brook trout, German trout, salmon and landlocked salmon from the Cold Spring hatchery of the N. Y. Fish Commission, and some eggs of the rainbow trout from the same place.

## OTHER FEATURES.

Many large striped bass and other fishes were displayed, and the floral decorations were much admired by the gentlemen as well as by the ladies, of whom there were a great number present. Climbing plants and trout made from different flowers, made a bright picture, and proved a treat to thousands who never have so good an opportunity of seeing such an exhibition as that yearly set out by Mr. Blackford. At Middleton & Carman's there was a fine display of trout from near home, and a large carp which swam contentedly in a globe. Inside the market, all was new and bright with freshly painted stalls. The dealers in butter, meat, game and fish were hurried to get their goods in all shapes to the hungry. In the crowd we noticed many anglers whom the recent cold storm had kept away from Long Island, and who, if they were deprived of catching trout, were determined to see them in all their variations of shape and color. Among them we noticed Prof. E. L. Youmans, ex-Gov. Gibbs, of Oregon; Fish Commissioner Hon. R. B. Roosevelt, John E. Devin, George Shepard Page, President of the Fish and Game Association; Assistant United States Treasurer, Thomas C. Acosta; Leonard Jerome, Jordan L. Mott, John Ford, and Earl Grosvenor, son of the Duke of Westminster, of England; Prof. Rice, of the Johns Hopkins University; Francis Endicott, President of the National Rod and Reel Association; Chas. M. Evaris, of Vermont; Dr. E. Bradley, President of Blooming Grove Park; A. N. Cheney, of Glens Falls; Charles Hallock, H. J. Fern, Superintendent of the Connecticut Game Commission; H. Thompson, Secretary Bistby Club; William Mitchell, Charles F. Murphy, Dr. Geo. M. Eddy, Prof. A. M. Mayer, Reuben Wood, B. F. Nichols, Charles E. Pecks, Fred Malfeson, Samuel J. Guthrie, and a host of others to whom we nodded as we passed through, but whose names have at present escaped us. Taking it all in all it was a great day for the worshippers of Saint Salmonus.

## VISITORS.

All day, from five in the morning until 9 at night, a constant stream of visitors passed through the part of the market next to Beekman street, and which is known as "Fish avenue." Ladies came in great numbers toward the middle of the day, and the restaurants were busy serving them in all shapes to the hungry. In the crowd we noticed many anglers whom the recent cold storm had kept away from Long Island, and who, if they were deprived of catching trout, were determined to see them in all their variations of shape and color. Among them we noticed Prof. E. L. Youmans, ex-Gov. Gibbs, of Oregon; Fish Commissioner Hon. R. B. Roosevelt, John E. Devin, George Shepard Page, President of the Fish and Game Association; Assistant United States Treasurer, Thomas C. Acosta; Leonard Jerome, Jordan L. Mott, John Ford, and Earl Grosvenor, son of the Duke of Westminster, of England; Prof. Rice, of the Johns Hopkins University; Francis Endicott, President of the National Rod and Reel Association; Chas. M. Evaris, of Vermont; Dr. E. Bradley, President of Blooming Grove Park; A. N. Cheney, of Glens Falls; Charles Hallock, H. J. Fern, Superintendent of the Connecticut Game Commission; H. Thompson, Secretary Bistby Club; William Mitchell, Charles F. Murphy, Dr. Geo. M. Eddy, Prof. A. M. Mayer, Reuben Wood, B. F. Nichols, Charles E. Pecks, Fred Malfeson, Samuel J. Guthrie, and a host of others to whom we nodded as we passed through, but whose names have at present escaped us. Taking it all in all it was a great day for the worshippers of Saint Salmonus.

ANGLING BOOKS.—The collection of angling books belonging to the late Lorenzo Prouty is now offered for sale. Mr. Prouty was an angler well known to our readers as being for the past quarter of a century at the head of the fishing tackle department of the late firm of Bradford & Anthony, Boston. During this time he collected many books on angling, and no doubt many of his friends will be glad to obtain a memento of him in the shape of one of his books, especially when it is known that the sale is for the benefit of his widow and child. A short time before his death Mr. Prouty had decided to withdraw from the firm above named

## The Kennel.

### FIXTURES.

#### BENCH SHOWS.

April 7, 1 and 5, 1933. National American Poultry Society's Eleventh Annual Bench Show, Pittsburgh, Pa. Entries close March 31. Class, Lincoln, Superintendent, C. B. Elton, Secretary.

May 8, 9, 10, 11, 12, 13, 1933. Westminster Kennel Club, Sixteenth Annual Bench Show, Madison Square Garden, New York City. Entries close April 13. Class, Lincoln, Sup't.

#### FIELD TRIALS.

November 19, 1932. Eastern Field Trials Club, Fifth Annual Trials, at Highland, N. Y. Entries for the Derby close July 1 for 1933. Members' Stake, Nov. 17; for the All-Aged Stake, Nov. 1. W. A. Coster, Secretary, Flatbush, Long Island, N. Y.

December, 1932. National American Grand Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Prayon, Secretary, Memphis, Tenn.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

### "AMERICAN KENNEL REGISTER."

As announced in our last issue, the Forest and Stream Publishing Company, at the request of many of their patrons, have undertaken the publication of a monthly register, *The American Kennel Register* is a record of all kennel events necessary for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register" of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of the annual volume, thus making it a complete work of reference. The pedigree registration fee is twenty-five cents, payable in advance.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs for sale, and deaths.

Prize list of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include field trials.

Space will be devoted to all matters of importance to breeders and those interested in dogs, the object being to render the *American Kennel Register* a complete record of the topics of the day.

The Register will be published on the fifth day of each month. All matter intended for publication must be in the hands of its editor by the first day of the month.

The initial number, however, will be published April 10, and all entries must be received by to-morrow, April 6, at the latest.

Entry blanks will be sent on receipt of stamped and addressed envelope.

The *American Kennel Register* will be sold by subscription only. The subscription price is one dollar per year.

Address: *American Kennel Register*, P. O. Box 2,282, New York City. Make drafts and money orders payable to the Forest and Stream Publishing Company.

### OTTAWA BENCH SHOW.

(Special Correspondence Forest and Stream.)

OUR first show is now a thing of the past. Except for the absence of Mr. Charles Lincoln, we might say it was a perfect success. Our genial superintendent was detained in Pittsburgh, and an additional note was sent to the effect that Messrs. Vickers and Allen in consequence. The successful management of the show is largely due to these gentlemen. The benching and feeding of the dogs left nothing to be desired.

The task of judging was in first-rate hands, and there were no grounds for the decision that certainly no one is better qualified than Major Taylor, of Lexington, Ky., to adjudicate upon the sporting classes, fox-terriers and spaniels appeared to give general satisfaction.

The quality of the dogs exhibited was remarkable and the classes were well filled.

Altogether we have very good reasons for being proud of our show, and it is to be hoped that it is only the forerunner of many good ones to come.

The Drill hall was singularly well suited for the purpose, being commodious and well ventilated. The judging rings were stationed at one end of the building, and great interest was taken in examining the judges at work.

His Excellency the Marquis of Lorne, Governor-General of Canada, opened the show, and appeared to take a lively interest in the exhibition. He was a frequent visitor. A special feature of the show was the collection of sportsmen's goods, which, though small, made up in quality what it lacked in quantity.

One of the attractions of the show was the celebrated Comet, the English setter belonging to the Dominion of Canada Kennel Club, and which gained such notoriety through the protest from the English Kennel Club of his pedigree by Purcell-Llewellyn. He is a handsome blue belton dog with a grand head.

The display of English setters was a very excellent one, particularly those from the kennel of Mr. Bailey Harrison, of Tilsonburg, who were singularly successful in carrying off the prizes. It is safe to say that there was not a bad one in all the classes of English setters.

In Irish setter the principal entries were from the kennel of W. N. Callender, of Albany, and Dr. Jarvis, of Claremont, and they were a lot of beauties. Such a collection of fine specimens is rarely seen even at the large shows. Old Rory O'More shows signs of age, but is still a hard one to beat on the bench. He was not entered for competition, however.

Major Taylor awarded the prizes in Gordon setters to the large, heavy type, ignoring those of smaller, lighter make; but there were some excellent specimens of the latter present, notably Brutus, owned by Tinsley & Donville, of Hamilton.

He is perfect in coat and color, and he looks a rare workman. Brutus will be heard of yet when the new standard of lighter-made dogs comes into fashion.

The pointer classes were not very well filled, but two or three good ones were shown. Chief Constable Draper's dog is a handsome dog of great quality, and looks fit for hard and stylish work in the field.

Champion Irish water spaniels brought out Mike, belonging to Mr. J. D. O'Leary, and he received many encomiums from sportsmen who are fond of duck-shooting. The judges expressed a high admiration for him and scored him 95 points out of 100.

The open class of water spaniels brought out some good ones; and first and second winners were very excellent. The second prize bitch, owned by Mr. Bailey Harrison, will in time

beat the other, as she is only a puppy yet, and her top-knot has not yet developed.

The clumber spaniels were represented by two, but neither of them has any great merit.

There was very little show of spaniels, field and cocker, especially among the blacks. Dr. Niven's Lass or Breda is a very good one. The Hornell Spaniel Club's Hornell Ruby is a very handsome puppy and will develop into a clipper yet.

Altogether the display of spaniels is the finest ever seen on this continent.

The show of foxhounds and beagles was very large, and some excellent specimens were shown. D. O'Shea, of London, as usual, was well to the fore.

Deerhounds and bloodhounds had some very fine entries. Fox-terriers were exceedingly good, the kennel of Messrs. L. & W. Rutherford, of New York, being a treat to see. It is a matter of regret that Mr. Richard Gibson, of Iderton, was not present with his dogs, as he owns some of the best in the country.

Mastiffs were only fair. The entries in St. Bernards were very numerous, and the judges asked that they be divided into two classes, dogs and bitches. This was lucky for the dogs, Lady Abbess, owned by Mr. F. W. Rothera, of Sincere, would have beaten the dogs.

Newfoundlands had some good entries, and the winner, belonging to a Montreal gentleman, was well. He is a huge dog, but active and well built.

The collie classes were very excellent, and the judges were lavish with his favors, which were all well merited.

The show of bulldogs was extremely good, and of very uniform quality. The winner had no easy task to win. The judge remarked that it was a splendid class, and showed the honors thickly.

Bull-terriers were very poor, and Mr. Kirk very properly withheld the first prize.

Scottish terriers were first-class. Not a bad specimen in it. Skyes were a rather mixed lot. A number of people enter half-blooded Yorkshires for Skyes, but the judge made an excellent selection in the winner. He is a grand young dog, belonging to Mr. O'Leary, of Toronto.

The Bedlington terriers attracted much attention, although their beauty is somewhat dubious except to a fancier, who prizes their workman-like look.

The Yorkshires were not a good lot.

Pugs were numerous, but with one or two exceptions were not of much account. Two English ladies sent out ten dogs and they had many admirers among the fair sex.

One or two good terriers and fox-terriers presented themselves before the judge, but the majority were dogs just too large to prevent them being entered in their proper class.

A very excellent spitz owned by Mrs. William Roger of Ottawa deservedly won first prize in the foreign breed group.

As usual, the miscellaneous class attracted a number of non-script mongrels, but a very handsome white English terrier, belonging to Mr. Scholes of Toronto, carried off first prize, and a King Charles spaniel belonging to the same gentleman took second prize.

A fine dog, belonging to Mr. Stewart of Montreal, and bred between a St. Bernard and mastiff, was very much admired, but only for his size and strength, as no points of breeding were apparent.

### LIST OF ENTRIES.

1. Champion English Setter Dogs.—Dominion of Canada Kennel Club's Belle, Bailey Harrison's Jack Laverack.

2. Champion English Setter Bitches.—H. Bailey Harrison's Belle's Child.

3. English Setter Dogs (except pure Laveracks).—Lindsay Russell's Bone, A. H. Chisholm's Prince Royal, James Leslie's Scot, H. Bailey Harrison's London, T. G. Courville's Grip.

4. English Setter Bitches (except pure Laveracks).—Wm. Dangerfield, Jr.'s Nellie, Wm. Hudson's Nell, T. G. Davey's Girl and Loverside, H. Bailey Harrison's Countess Alice, Grace B. and Countess Vic, A. Francis's Princess, and G. Davey's Lady Rose.

5. English Setter Dogs (of pure Laverack pedigree).—T. G. Davey's Lady Rose.

6. English Setter Bitches (of pure Laverack pedigree).—Dominion of Canada Kennel Club's Corina, W. Peters Price's Pet Laverack.

7. English Setter Dogs, under 18 months and over 12 months.—No entries.

8. English Setter Bitches, under 18 months and over 12 months.—No entries.

9. English Setter Dogs, under 18 months and over 12 months.—No entries.

10. English Setter Bitches, under 18 months and over 12 months.—No entries.

11. Champion Irish Setter Dogs.—W. N. Callender's Lady Belle, Wm. Jarvis's Noreen.

12. Champion Irish Setter Bitches.—W. N. Callender's Lady Belle, Wm. Jarvis's Noreen.

13. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

14. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

15. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

16. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

17. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

18. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

19. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

20. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

21. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

22. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

23. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

24. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

25. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

26. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

27. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

28. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

29. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

30. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

31. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

32. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

33. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

34. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

35. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

36. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

37. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

38. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

39. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

40. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

41. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

42. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

43. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

44. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

45. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

46. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

47. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

48. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

49. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

50. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

51. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

52. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

53. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

54. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

55. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

56. Champion Irish Setter Bitches, under 18 months and over 12 months.—No entries.

57. Champion Irish Setter Dogs, under 18 months and over 12 months.—No entries.

**DEATH OF B. H. G. VICARS.**—The many hundreds of our readers who came into contact with the secretary of the Ottawa Bench Show, lately held, will be inexpressibly shocked and grieved to hear of his untimely death, at his home in Ottawa, Wednesday, April 5. To his energy and labors in the cause of the Dominion of Canada Kennel Club may be, in the greatest measure, ascribed the singular success of their inaugural bench show, and to his indefatigable exertions in this direction, while suffering from a severe cold on his chest, the fatal termination of his illness is mainly due. He was thirty-three years of age, and had many friends. Holding a public position as Paymaster of the Indian Department, he was universally beloved and respected. Of quiet unassuming manners, the energy and indomitable perseverance that characterized the man, were not apparent on the surface, but all who were fortunate enough to own his friendship, knew how steadfast and true he was. The Dominion of Canada Kennel Club has sustained a severe loss in his death, and will find it impossible to replace him. Without him it would never have arrived at its present solid proportions, and he spared no effort, at whatever cost to himself, to further its interests. His sad and premature end is mourned by thousands.

**THE NEW YORK SOCIETY.**—We have heard it intimated that the Game Protective Society of this city, once a power in the land, is gradually becoming "tired," and has ceased to give its important work the attention absolutely necessary if the organization is to retain its prestige and usefulness. It is said that beyond holding its monthly dinners the society has of late shown no signs of existence. This is exceedingly unfortunate. The New York Society for the Protection of Game has a large membership and a generous bank account. It appears to lack only one thing; that is enthusiasm, and we believe that there is plenty of this left, if it could only be utilized and properly directed. As the society is at present constituted, there is very evidently something radically wrong. What is it?

## ROD AND POLE.

A CORRESPONDENT writes: "It has been agreed to refer a technical dispute for your decision. What is the correct expression for a grown stick used for fishing, or let the stick be jointed. Is it a fishing pole or a fishing rod? One side of the question is that a long stick, or say a pole, becomes a 'fishing rod' when used for fishing; other side is that 'fish pole' is a perfectly correct expression. Which is which?"

The exact period when a pole arrives at the dignity of being a rod is as obscure as the day on which a boy ceases to be such and is invested with the proud title of man. There are poles which are unmistakable poles, as there are fine rods which no angler would insult by designating them poles. But there are also all the intermediate gradations, non-descript things whose true name and character are involved in doubt. We own a fine rod, one of the most elegant and excellent tools that ever filled an angler's hand and eye, and on producing it to the eyes of a gaping rustic have seen a chill extend each way from its ferules until the shrinkage spoiled the varnish when the yokel called it "a nice pole."

Frank Endicott draws the line at bark. In his vocabulary a pole is a stick with bark on it, and he splits it as fine as this: "If the alder pole cut at the brookside is fished with in its natural state it remains a pole. If it is peeled from the butt for two-thirds of its length, and the bark left on the tip, as we properly did in boyhood days, it at once is elevated to be a rod." Who can dispute the authority of the President of the National Rod and Reel Association?

A question of this kind should be calmly discussed, and presented in a fair manner. We have not the slightest wish to force our opinions upon the disputant cited by our correspondent, nor upon other anglers. That a man is entitled to his opinions, is too true an axiom to be quoted, and as we wished to get at the sentiment of the best anglers on this subject, we telegraphed the question to President Arthur, now fishing in Florida. He promptly replied: "I know nothing of fish poles, except that there are shad poles in the Hudson River—Arthur." We never heard that General Arthur belonged to the hand-line committee, and we are in doubt if the telegraph rendered our question intelligently. We next sent a message to the Hon. James Geddes, Assembly Chamber, Albany. He replied, "I know what hop-poles are and hoop-poles; have heard of bean-poles, but fish-poles are something that I never heard of." Now, Mr. Geddes is an angler who handles a rod in good style, and don't even know what a pole is—in connection with fish.

From this we draw the conclusion that the two last-named anglers do not know as much of poles as we do, for we have seen darkey boys down South using a pole so heavy, that they could not hold it, but with which they "slung" the oleaginous catfish from his native lair high into the blue empyrean. We confess that we don't know much more about this subject, and will be glad to learn something concerning poles, if they have an occasional connection with fish.

**WILLIAM MILLS.**—We regretfully announced the death of Mr. William Mills as our last issue went to press, too late to give the particulars. Mr. Mills was the senior partner in the fishing tackle house of William Mills & Son, 7 Warren street, New York. He was born in England in 1822, and would have been sixty-one years old next September. His early life was spent in a manufactory of fish-hooks and needles, and for many years he was engaged in their manufacture for the American house of T. & H. Bate, 7 Warren street. He came to this country in 1853, and in 1857 became a partner in the firm of T. H. Bate & Co., at the same place. He had entire charge of the business of the firm, and with his son succeeded to it, under the new firm name. About nine years ago he gave up active business to his son, Thomas B. Mills. He had an extensive acquaintance and was highly esteemed for his probity and thorough business qualities. He died quite suddenly from the effects of a severe cold, which at first seemed to have little effect upon his vigorous constitution. He leaves three children, and will be missed by a large circle of friends.

**"AMERICAN KENNEL REGISTER."**—The initial number of the Register has been mailed to its subscribers, and with the paper in their hands, owners and breeders of canine stock may judge for themselves of its merits. We are much pleased to acknowledge the hearty welcome already accorded to the undertaking. All persons desiring to avail themselves of the privileges of the Register, are reminded that entries for the May number should be in hand at once.

**POACHERS AND PROVIDENCE.**—The man who fell through the bridge on Sunday and broke his leg was consoled by the assurance that his calamity was a dispensation of Providence; that he had no business to be crossing the bridge on Sunday, and that the broken bone was a direct and just punishment. This is comforting philosophy; and we commend it to Mr. H. Babcock, of Bradley, Me., who was out deer hunting in the close season last month. One Neddo was also out hounding deer; and when he shot a deer, the bullet went on and wounded Babcock, almost fatally. Another gentleman who may profitably study this subject is the Somerset county hunter, in the same State, who, while deer hunting last month, shot himself in the arm. Both of these unfortunates may come to the conclusion that their misfortunes are the direct visitations of Providence; but the Maine Commissioners appear to think differently, or, at all events, they do not consider the providential punishment sufficient, and are only waiting for the deer shooters to recover before collecting the fines. This is most assuredly "rubbing it in" with a vengeance.

**MASSACHUSETTS ASSOCIATION.**—The annual meeting of the Massachusetts Fish and Game Protective Association was held April 6. The treasurer's report, which was accepted, shows the expense of the year to be \$404.60, with a balance on hand of \$267.93. The following officers were elected for the ensuing year: President, John Fottler, Jr.; Vice-Presidents, Hon. Thomas Talbot, Hon. Daniel Needham, Walter M. Brackett, Charles W. Stevens, H. T. Rockwell, C. T. Jenkins, T. T. Sawyer, Jr.; Treasurer, James R. Read; Recording and Corresponding Secretary, E. S. Tobey, Jr.; Librarian, John Fottler, Jr.; Executive Committee, Ivers W. Adams, Warren Hapgood, Dr. J. T. Stetson, F. R. Shattuck, William S. Hills; Committee on Membership, W. M. Brackett, Walton C. Taft, George Mixer. Two new members were elected into the association. Colonel Samuel Webster, one of the Board of Commissioners of Fishing of New Hampshire, was present and made a few remarks on black bass fishing in that State.

**THE PILOT'S BRIDE.**—In our last Christmas and New Year's numbers Mr. John Easmond gave an account of the wreck of the bark Trinity, on Heard's Island, in the Atlantic. The crew, it will be remembered, expected to be succored by Capt. Fuller, of the Pilot's Bride, and when the months passed by and the Bride did not come, the Crusoes of Heard's Island concluded that Capt. Fuller had broken faith with them. It has just transpired that the latter was himself cast away on Desolation, where his crew underwent an experience very like that of the Heard's Island party. They saw the Marion when she took off the Trinity's crew, but they were unable to attract her attention, and she, unconscious of their misfortune, passed by. They were finally rescued by a New London ship, sent out to their relief, and arrived home last week. What a volume of romance might be written about these barren isles of the Southern Hemisphere. This is the brief outline of one more chapter in the dismal history of Desolation.

**AN INCREDIBLE STORY.**—The New York Herald of April 6, in the course of an account of President Arthur's preparation for his fishing trip to Florida, reports the following: "During the afternoon one of his Cabinet officers called and discussed affairs of State while the President was examining the joints of his favorite rod. 'What do you expect to catch?' asked the head of the department. 'So long as I do not catch cold, which is the easiest thing to do here in Washington at this season of the year, I shall not regret the trouble the trip costs me,' was the reply." Now, we utterly refuse to credit the Herald's statement that the President said any such thing. The "catching cold" joke is a great deal more ancient than the Pyramids. It has been repeated with damnable iteration several million times, in all languages; and we are certain that Mr. Arthur, on the occasion referred to, did not make use of it.

SEVERAL COMMUNICATIONS have been received too late for insertion in this issue. Correspondents are particularly requested to favor us with their contributions as early as possible previous to the issue in which they wish them to appear.

OUR READERS will confer a favor by sending us the names of such of their friends as are not now among the subscribers of the FOREST AND STREAM, but who would presumably be interested in the paper.

## HUNTING IN THE MIDDLE AGES.

"By hunting one avoids the sin of indolence, from which springs all mortal sins; and, according to our faith, he who avoids the seven mortal sins will be saved; therefore, the good sportsman will be saved."—*Georden Phœbus*.

THE good people of the Middle Ages were as fond of hunting as we are to-day. Kings, ecclesiastics and peasants took part in the sport, and game being plenty and hammerless breech-loaders lacking, the "gentlemen sportsmen" of those days probably never had any occasion to write caustic letters to their sportsmen's journal about the depredations of pot-hunters. Hunting, as it was then followed, was divided into three branches. Vencry, one branch of the sport, as defined by M. Elzéar Blaze, was "the science of snaring, taking or killing one particular animal from amongst a herd." Hawking or falconry was the training and using of birds of prey to hunt feathered game; and fowling (*Poissinerie*) was the destroying, in a sort of go-as-you-please way, of all the birds which made havoc on crops and fruits.

Charmagne was the greatest hunter of his time. With a troop of knights and "ladies fair," accompanied by hounds and a gang of beaters, he would ride at the head of his company into the forest, attacking with spears such animals as came in his way. The beaters and dogs first scurried through the woods, blowing horns and making a great hubbub, driving the wild bores, bears, wolves, stags and what-not into an inclosure of cloths or nets, where the poor things couldn't get out without running the gauntlet of the emperor and his knights. Sometimes an irate porker would rip up a horse or two with his tusk, or a demonstrative bear would hug the life out of half a dozen beaters, and then there was fun, you can be sure. The knights would boldly attack with their lances, while the ladies, at a safe distance, would cry, "Ain't it awful!" (in French, of course), or giggle behind their fans when some martinet who wanted to show off got the seam of his hose and smallclothes ripped up by a stag's horn.

Falconry or hawking was the gilt-edged sport of the Middle Ages, as only the nobility could afford this costly pastime. The birds used were the gyrfalcon, saker hawk, lanner, merlin and sparrow-hawk, the last being the smallest, and used only in the pursuit of pigeons, quail and small birds. The birds were imported at great cost from Sweden, Iceland, Turkey and Morocco, and enormous sums were spent in their training and equipment. "They were considered the noblest of birds, far superior to an eagle as we would deem an eagle superior to a mad-hen. The leather hoods worn on their heads were embroidered with jewels made of gold and pearls, their perches were gold-mounted, and the glove on which they were carried by their owner was made of richest stuff adorned with costly jewels. History doesn't state whether they were fed on Dresden or Sèvres china, but it does say that no other birds were permitted to eat from the dishes used by the falcons.

Their training was undertaken by the head falconer whose rank was the highest of any of the servants of the nobility. That his position wasn't exactly what a politician would call a "soft snap" we can imagine from the amount of learning necessary to the complete education of a falcon. The young bird was first made familiar with men, horses and dogs. When his fear of these was overcome, a checkcord was attached to him, he was allowed to fly a short distance and was then drawn back to be fed. Afterward he was permitted to catch a wounded bird or hare, near his preceptor, and his prey was taken away from him before he had an opportunity to tear it in pieces. On his returning to his perch on the hunter's thumb he was invariably fed, so that, his dietic sentiments being worked upon, the bird was never anxious to put too great a distance between himself and the source of his nourishment, especially as he was hunted on an empty stomach. After being taught to obey the whistle, the voice and the signs of the falconer, two silver bells were attached to the bird's legs, and the falconer reported to his noble lord that his pupil's education was complete. If, however, the sweet bird-graduate refused to come back to the lordly thumb on his first trial, or couldn't be lured by an imitation bird of cloth with a favorite piece of flesh as bait—presto! off comes his trainer's head, and his lordship advises for a new falconer, with references. What painstaking pedagogues we would have if that rule were law in these dark ages!

They had sportsmen's clubs in the Middle Ages, too, with Free Mason tendencies, having signs, passwords and grips, lucky numbers and emblematic colors. Gérard, Duke of Cleves, created in 1455 the order of Knights of St. Hubert, into which only those of noble blood were admitted. As a badge they wore a gold or silver chain formed of miniature hunting horns, from which was suspended a small likeness of the patron saint. Perhaps it was this club which made the first attempt on record to stock a country with foreign game. Anyhow, we are told that in the time of Charles VIII, reindeer were imported into France from Lapland, and pheasants from Tartary. The latter thrived, and our French friends are shooting their descendants to this day; but the men who took the job of bringing over the reindeer forgot to fetch along enough icebergs to last through the dog days, and the result was that the warm climate enervated the once hardy reindeer. They acquired habits of indolence, became corpulent, and instead of running away

when hunted, they would lie down quietly, chew their cud, and pass themselves off on the dogs for new milch cows, so that the noble lord would experience much the same soul-stirring excitement in the sport as he would by going out in his barnyard and killing his best Jersey heifer with a meat axe.

In the National Library at Paris is an illustrated manuscript treating of the art of hunting, written by Gaston Phœbus, whose simple and sound views on the future salvation of sportsmen will be found at the head of this article. The author lived in the earlier portion of the Middle Ages, and his writings and sketches may be accepted as accurately representing modes of hunting in those days. He has drawn pictures of dogs that are perfect representations of modern greyhounds, and several that would pass for pointers if it were not for their heads, which are contracted like the head of a bulldog. The only rough-coated dogs represented are two, which resemble the setter in all but the head, that appendage having the appearance of a "cutting" from a bulldog grafted on a setter's body.

The "shooting-iron" of Phœbus's time was a cross-bow, the arrows used having long, sharp metal points for penetrating the thick fur and tough hides of bears and wild boars, while those used for hares and such small game had a conical-shaped terminus like a potato-masher, probably of lead, to stun the quarry. Leopards imported from Africa, our author tells us, were used for hunting animals the same as falcons for hunting birds, and he gives us an illustration of a huntsman seated on a horse, with a leopard ensconced on the croup behind him. The sardonic smile on the leopard's face seems to intimate that, in default of other game, he would have no scruples about gobbling up the huntsman and his horse.

Some of our modern hunting stratagems are shown by Gaston Phœbus to be nothing new, after all. Out on the Western prairies geese are often approached within gunshot by a sportsman driving an ox-cart, or concealed behind a grazing horse. In this ancient manuscript is an illustration of a hunter approaching his prey in a cart, with a "blind" of twigs and leaves built around him; and another represents a hunter stealing toward a body of wildfowl, holding in position a piece of cloth cut after the pattern of a horse. They must be geese indeed that would take this bandy-legged hunter and his cloth for a grazing horse. It is interesting to note that "tolling" was practiced in those days—not on ducks, but on woodcock. There can be no mistake about it, for the drawing of the woodcock is perfect. The hunter was completely covered, except his eyes, in cloth of a dead grass color (in autumn), and on spring the woodcock would lie at full length, waving a scarlet cloth back and forth. The foolish woodcock, impelled by curiosity, would approach nearer and nearer, until the hunter, able to slip a noose over the bird's head, would yank him to kingdom come. An amusing way of trapping birds was to distribute small mirrors around the forest. When a he-pheasant, in his post-prandial saunter, caught sight in the glass of what he probably supposed was another he-pheasant mimicking his motions, he would haul off to "knock him out," and at the first crack down would come a rock, and there would be no more post-prandial saunters for Mr. Pheasant. Sometime a number of stool-birds were set loose from their cage, and cords covered with bird-line attached to them. Then divers other birds that might seek their acquaintance would become so firmly attached to them that they couldn't tear themselves away when they had finished their call, and were forced to stay to dinner, which they attended in undress uniform, sometimes reclining on pieces of toast, with drawn butt poured over them.

Old German legends are notorious for telling some pretty tough stories, and they have given us some on hunting, which, although we repeat them, had better be taken *cum grano salis*, as we cannot vouch for their strict up and down truth. In one of them it is stated that, when beasts were being pursued, if they ran into the arms of a saint or into a sanctuary, their lives were always spared. This fact getting noised around among the animals, they wouldn't skip for their dens when alarmed, but would cut cross lots for the nearest church or abode of a saint. One day a huge bear, finding the chase growing too hot to be comfortable, burst into the cell of a saintly monk while the latter was piously engaged in deepening the color of his nose with a bottle of Veuve Clicquot. It seems that this particular saint wasn't aware of the arrangement between animals and those in religious orders, and while the bear, in his untutored, bearish way, was trying to explain that it was necessary for him to repose in the monk's arms in order to save his life, the monk first the bottle at the bear and took a back summersault out of the window, the beast following. But the more the latter insisted on seeking his embrace the harder ran the saint, counting his beads wrong end foremost in his haste, and you could have played checkers on the tail of the holy man's cassock until the hunters: caught up with the bear and killed him.

Another legend relates that a hunter sold his soul for an enchanted arrow that never missed its aim, and another swapped his soul for an arrow that would carry an enormous distance. What a haul of souls the devil could have made if he'd had a few choke-bore breech-loaders and thread-wound cartridges to dicker with!

In the Middle Ages hunters lied about the quantity of game they killed just as they do now.

SENEXA.

## The Sportsman Tourist.

## HUNTING THE MOUNTAIN GOAT.

"Here's a health to the FOREST AND STREAM."

FOR ten long hours we have been toiling up the side of this rugged mountain, and when at last, by the overhanging roots and branches, we pull ourselves up the last steep pitch, and catch the cool breeze from the surrounding snow peaks, and know that for the present our climbing is at an end, we feel like embracing somebody. And when, a few minutes later, W. shoves a cup of hot punch under our nose, and asks us to drink, we ought to say something as a toast, and why not the one that heads this article. And so here, some three thousand miles away from you, and four thousand feet above the sea level, we reach out our hand to the FOREST AND STREAM as to an old friend.

My party consisted of Mr. H., Mr. W., and Mr. K., gentlemen who, having a few days' respite from poring over pay lists and balance sheets at this end of the Canadian Pacific Railway, were just wiled to spend it with rod and gun, beneath the shade of Douglass firs, by the side of the noisy strainer, or

"Up where the canyon's dizzy trail  
Leads to the snow divide."

Our camp was pitched on one of the numerous ridges which make up the summit of this portion of the coast range. To the south this ridge rose with an easy grade till its crest was reached some two hundred feet above the level of our camp ground, at which point it was intersected by others running at different angles.

Along the crests of these ridges one may travel for miles, having in many places only a few yards on either side between a high and a fall of five or six hundred feet. A few yards north of our camp the ridge terminated, or rather broke off abruptly, forming a pretty sheer precipice, at the foot of which, five hundred feet below, nestled in a setting of green and gold, was a beautiful little lake some four or five hundred yards in extent.

Although at our feet the heather bloomed with the freshness of summer, everywhere on the wooded slopes the varied tints of the dying year met the eye, and a step higher up the sight is lost in a confusion of snow peaks and storm-wet cañons.

H. had laid down his rifle and was busy with his pencil and sketch book when Leammux, who appeared to be more concerned about the welfare of his four dusky companions than with mountain scenery, came up, and pointing up the ridge, asked if it was our intention to feed his Indians on white man's muck-a-muck, or the flesh of the mountain goat. If the latter, which he much preferred, if I would be kind enough to lend him my rifle he would see that their first supper on the top of the mountain would be made from the juicy ribs of that animal. We turned and looked in the direction pointed out by the Indian, and sure enough three goats were in sight, two on the left slope of the ridge, and one on the right. H. at once started in pursuit of the two, while Leammux and I stole away toward the single one.

I did not understand until some time after our return home, why it was that Leammux was so concerned about my success, and put on such a terrible scowling look every time I made a failure. The reason was this: He had made a wager with his companions that I would kill more game than anyone of the party, and to this day he believes I sold him; and it has already cost me a cast off coat, a pair of old gun boots, and a worn-out hat to get him to recognize me when we meet. As we left H. no sooner was the latter out of sight, than the old fellow started on the run, urging me forward, in hopes that I would get in my shot first. But I took my time. It was H.'s first sight of these animals, and I was anxious that he should make a success of his first shot at them.

At length we neared the point where the goat was first noticed, when Leammux suddenly ducked down behind a block of granite and commenced jerking his long bony arm in the direction of the top of the ridge, while every feature of his greasy face, every contour of his huge mouth, said as plainly as if he had shouted through a trumpet, "Why in thunder don't you shoot?" I looked but could see nothing on the heather-covered slope but a few blocks of gray granite and here and there a patch of snow. I was about to take a glance toward the Indian, when quick as a flash one of the patches of snow threw up its head and disappeared over the crest of the ridge. The Indian stood up, and just then two shots were heard in the direction of L. Leammux stuck up two fingers, uttered the word "*nos*" (two) and stepping past me with the air of an offended Sitting Bull, strode off to camp without once looking behind him. H. had better luck and had knocked over two goats; and long after we had retired to rest our dusky guides squatted round the camp-fire, and with pieces of hide and goat broiling before them, spun out yarns of deeds done by mighty goat hunters of their tribe who were now dead.

The next morning we had our breakfast over by daylight. The Indians were just finishing theirs. My companions were in the tent fixing up for the day's hunt, while I, with my back to the fire, was leaning over a rock enjoying a quiet smoke. Suddenly the tread of an animal, coming along the face of the cliff below our camp, caught my ear. Now, as before, at the ridge, a few rods north of our camp, broke off almost perpendicularly, leaving a face some 500 yards wide. Still, on a previous visit here, I had noticed a trail along which goats had made their way across this face from one slope of the ridge to the other.

This trail came out upon the more level ground, directly in front and about twenty yards from me. So I kept my eye on that point, rather carelessly, though, because I could not imagine that any wild animal of such size would be so near to our camp with all the bustle of the morning meal going on. I had not long to wait. Presently the head, then the shoulders appeared, and finally the whole body of a monster white goat stood before me. I suppose the animal was surprised, for it stood stock still, and subsequent events proved that I was not only surprised, but completely dumfounded. I stared, I gaped, I yawned, but in bringing back my hand in some unaccountable don't-know-how-it-was-done way the piece was discharged in the air. The goat wheeled and disappeared under the cliff. A hop, step and a jump brought me to the edge of the cliff just beyond our tent, where I again came in sight of the goat making his way along its race. He was over two hundred yards away, and at that distance I fired three shots at him, which

scarcely had the effect of quickening his pace; and were it not for the fact that my companions noticed that every shot struck about a foot over the goat's back, I would have pronounced him bullet proof.\*

I suppose I looked ridiculous, and, from Leammux's standpoint, probably contemptible; and when a man, with the reputation of being the best shot in the neighborhood, shoots three times at an animal nearly as big as a mule and misses it, I dare say he ought either to blame his rifle or apologize. But I did neither. I simply threw my gun over my shoulder and gave the order to disperse over the ridges.

We had scarcely gone half a mile from the camp, when a shout from the Indian we had left in charge brought one of our number back, to find that a large goat—probably the same—had beset the trail and was about to charge on the left flank of the tent. Two or three shots from a rifle, however, had the effect of making his goatship raise the siege and go away, if nothing more.

Now it is a curious fact that, with the exception of H., every shot fired during the hunt missed its mark. And this, too, with men having a fair record with the gun, and an experience of twenty years in the mountains, during which time they had bagged a large number of deer and other kinds of game peculiar to the province. During the day a black bear ran the gauntlet of W. and K.'s rifles, and the brute got away, leaving no crimson stain on the bank of snow over which he scampered. The last act of the hunt was performed in the following manner:

While on the top of one of the ridges, H., myself and Leammux discovered a goat lying in a shady nook on the side of a cliff about a thousand yards away; a discussion arose as to the best means of getting within the range, and we finally decided to go straight down the slope and take our chances of getting into the bushes, some half way down, unobserved. So down we started, the old Indian taking the lead, his supple body twisting around the corners of granite blocks and worming along the depressions in the ground, while H. and myself followed, "each stepping where his leader stepped."

There were many interesting moments in the life of a hunter. The catching of the first deep notes of the approaching hound, the bending over the prostrate form of his first deer, and the quiet smoke by the night camp-fire, are all enjoyments worthy the best of nature; but the act of approaching within shot of some coveted quarry, the matching of human experience and cunning against the keen senses of an alert and wary animal, is to my mind the cream of a hunter's experience. The breaking of a twig, a false step, the rustle of an overhanging bush, may cost you a deer, drawn sigh for hopes departed with the fleeing game. Or perhaps at the last moment, when a few more steps would bring you within a possible chance, a fitful puff of wind carries forward the scent of your presence, and then with blood trickling from half a dozen wounds from pointed rocks and thorny brambles, you come to a halt and watch the coveted prize recede in the distance. The odds are, in my opinion, always with the game, but nerve and patience rarely bring victory to the side of the hunter, and win or lose, I always find the excitement worthy the effort.

An hour's creeping and worming down the long slope brought us to the verge of a deep cañon, across which we had to shoot, at least it was as near as we could approach and be in sight of the game. However, we were satisfied with the distance, and also felt sure of the goat, because, if he attempted to escape, he would have to go one hundred yards before reaching the top of the cliff, and the distance was more than double that distance to reach the top of the cliff, so we took it cool; and a difference of opinion arose as to the distance across. I asserting that it was between two hundred and fifty and three hundred yards, while H. thought it much less. At this point Leammux, who was standing just behind me, thinking to give me one more chance to redeem my character, bent forward, and pretending to brush away from before me, whispered that the distance was about the same as that at which I had shot the bear, referring to an occurrence which took place about a month previous. Now the distance referred to was only about one hundred yards, and the idea that my judgment should be thought so far astray, simply irritated me; so I shoved the old fellow away, telling H., impatiently, that I was going to shoot at two hundred and fifty, the latter replying good-morning. "All right, two hundred and fifty yards."

Just then the goat discovered us, started up the cliff, but changing his mind, wheeled, and was making for the timber below, when two streams of sparks and smoke shot out from a clump of bushes and two leaden messengers sped away across the cañon to find a resting place in some of the crevices in the cliff, and the goat kept on unhurt. Again the deep echoes echoed back the reports of our rifles and still the goat kept on toward the timber. This time, however, I was a little behind me with his shot, and watching its effect I saw the dust scatter from a point on the cliff about a foot above the goat's back. I shouted to H. to "fire lower," that we were shooting a foot too high, when the latter, throwing forward his rifle, and muttering something that sounded like "I told you so," pulled the trigger, and the poor goat, just as he was making his last leap toward the cover, was pierced through the shoulders and fell a distance of a hundred feet clear. This broke the back link in the line of friendship between myself and Leammux, and when I reached out my hand and congratulated H. on his good luck, the old fellow muttered something in the guttural language of his tribe, which if interpreted no doubt would be, "Well, that lets me out on you," and started out in search of an easy place to go down the cañon after the dead goat.

The new goats were found on the summit, while a hundred yards below in the timber, through which it was simply impossible to follow them, the ground was everywhere cut up with their hoofs, a circumstance which even the Indians could not account for, as during the summer and fall months and until driven below by the deep snows the summit is their home.

Now that I could no longer have had a most enjoyable trip and glorious weather, and when my companions learned something of the habits of an animal which they had never before seen. They also shot three, and as the skins at that time were of little value, and the three carcasses were really all that we required in the way of a change in our much-a-muck department, why, we hadn't much to grieve about. When a hunter shoots merely for the sake of adding to his bag, when he continues to take life with no

thought as to whether his victims shall be turned to some benefit or rot where they fall, he ceases to be either a gentleman sportsman or a pot-hunter, and becomes a rapacious brute, whose ignorance and shrink-like propensities ought to render him from a place round the camp-fire.

During one of our rambles on the summit we crossed over a place of several hundred yards in extent filled up with broken rock which had toppled away from an adjoining cliff. This place had every appearance of being the abode of a colony of marmos or rock-whistlers, but as it turned out was now entirely deserted, the cause of which Leammux told in the following story, which, perhaps, it will be as well to take *cum grano salis*:

"Many years ago," said the Douglass Indians came to shoot sheep (mountain goat) and finding this place, and wishing to kill some of the squa-uks (marmos), without encroaching on their seat stock of powder and shot, bethought themselves of the following plan. Some of their number went down in the timber and gathered a large quantity of gum from the fir and pine trees. This they melted and poured on the different sentinel rocks, that is the high pinnacle rock which is generally found directly over this mode of entrance to the squa-uks' house, and upon the top of which the little fellow sits down to take his regular watch and give warning at the approach of danger by sending forth his long half human whistle. Well, the pitch was poured on, and when the squa-uks came out and took their accustomed stations, they soon found themselves lost to the rocks, when the Indians came up and knocked them over with clubs. This was repeated many times until the squa-uks discovered the trick, and being thoroughly disgusted at this mode of warfare, and not wishing to be exterminated by such a veritable set of pot-hunters as the Douglass Indians were, they picked up their household goods, their young and feeble ones, and in the stillness of the night, beneath the silent stars, they stole away, crossed Sennour Creek, and made themselves a new home among the snow peaks where the Douglass Indians dare not follow them."

A few straggling members of the Bohemian waxwing (*Amphispiza bilineata*) were noticed here this winter, once in January and once in March, only about a dozen altogether. Robins (*Turdus migratorius*) arrived Feb. 20. Western bluebirds (*Sialia mexicana*) March 1. Black brant (var. *nigricans*) March 4, but our weather for many weeks back has been so extremely mild that the great army of our northward migrants and summer residents may be upon us any time now. Jaegers (*Pica hudsonica*) left for their breeding grounds, beyond the Cascades, nearly a month ago.

Deer have almost disappeared from this (south) side of the inlet, but are apparently as abundant as ever on the north side, and considering that the conditions in the matter of food and cover are equal, and that six years ago deer were plentiful all along the south shore, it is a question worthy of debate as to what has brought about this change. My own conclusions are already formed, and if the readers of FOREST AND STREAM will forgive me for opening a question which for the last year has been thoroughly discussed in its columns, will give them, however, that they come from one having a very strong prejudice against hounding deer, at least to that extent with which it has been practiced for the last ten years at Burrard Inlet.

My experience with hunting on Burrard Inlet extends back ten years, and during that period the south side has been the great hounding ground for all parties living in the neighborhood. It is a pleasure to me to see that sport. Deer were just as plentiful on the north side, but, owing to a number of streams putting in from the mountains, the practice of hounding on that side proved a failure from the first, and during the years above mentioned no hounds have been used there to my knowledge. On the other hand, that side has always been, and is still, a successful ground for the still hunter, both white and Indian.

Now here are two stretches of country some twelve miles long, separated by a sheet of water from a half to two or half miles wide. At a certain period deer were fairly plentiful on both stretches. The conditions of feed and cover have kept about the same, and, until the last year, when the building of the terminus of the Canadian Pacific was commenced on the south side, the encroachments of civilization were about equal, and yet to-day there is little or no use for the hounds, while the still-hunter continues to shoot his deer wherever he wants to. JOHN FANNIN.

SUMMIT OF MOUNT YU, NORTH ARM BURRARD ISLET, BRITISH COLUMBIA.

## ROUTE TO THE NEPIGON.

"ANGLER'S" inquiry as to the shortest time route to the Nepigon in the Forest and Stream of 5th inst. may be answered in several ways. The absolute shortest time route would be by rail to Marquette, and thence across the lake to Red Rock by steam tug, which can always be procured at Marquette. But this is expensive.

Or "Angler" may take one of the Lake Superior steamers at Chicago for Sault Ste. Marie, and thence by Canadian steamer to Red Rock. If close connection is made at Sault Ste. Marie, he may reach the Nepigon on the fourth or fifth day after leaving Chicago. This is the cheapest route. But only a few of the steamers touch at Red Rock, and much time may be lost at Sault Ste. Marie. If the party is large, say eight or ten, a tug can be had ordinarily at Sault Ste. Marie at from \$100 to \$150, making the cost little more than by steamer. The cost of tug from Marquette will ordinarily be about the same.

Or, if the Canadian land does not touch at Red Rock, passage may be taken for Silver Lake, or Prince Arthur's Landing, and boats or tug secured to the Nepigon. The distance is seventy-five miles from the former and about ninety or ninety-five from the latter place. If sailboat is employed a camping outfit will be necessary, as the trip may take from two to four days, depending upon wind or rains. But I suppose no one will go to Nepigon without camping outfit, including a good mosquito bar.

In returning, one can ordinarily get boat or canoe to Red Rock, or time his return by the call of a steamer. With a party of ten or more arrangements can be made with a Canadian steamer from Sault Ste. Marie to Red Rock ordinarily, and for return at about a given time.

I have more frequently taken voyagers and Mackinaw boat from Sault Ste. Marie on steamer. It is doing one has the means of coasting back to Sault Ste. Marie or to Silver Lake to take a steamer.

But one visiting the Nepigon must not be too limited as to time, for adverse winds and fogs are apt to play havoc with the best laid plans. I have been ten days from home before casting a fly, and I believe six days was the shortest time.

A few trout—occasionally a fine one—can be taken at Red Rock. Twelve miles above, however, they begin to be plenty. In fact, it is seldom any are taken between Red Rock and Camp Alexander. The rapids above Camp Alexander and Cameron's Pool, about fourteen miles from Red Rock, have good fishing. But Cameron's Pool is a very hard place to reach, and is seldom visited. There are numerous rapids and pools above, clear up to Virgin Falls, where the lake becomes the river, thirty-seven miles from Red Rock. Canned and provisions can always be had at Red Rock, and excellent Indian guides.

I omitted to state that a day can probably be saved by taking the Grand Rapids and Indiana Railroad to Mackinaw (or the Straits) and meeting the Lake Superior steamer at Mackinaw. FISHERMAN.

April 7, 1883.

## Natural History.

### THE PANTHER OF THE MCCLLOUD RIVER.

*Felis concolor.*

THE panther of the McCloud River, Cal., although known in different parts of the country under the various names of panther, cougar, painter, puma, and California lion, is nevertheless the common panther of North America, the scientific name of which is *Felis concolor*.

In color, weight and general appearance the McCloud River animal differs less from the panther of the Atlantic Coast than might be expected. The panther skins that I have collected in Northern California look much in color and quality of fur like the skins of Eastern panthers that anyone seeing them would suppose that the two creatures had lived side by side, instead of 3,000 miles apart and in totally different climates. As to size, the panthers of the Pacific Coast do not seem to differ much from those of the Atlantic Coast, and all the skins of the McCloud panther that I have measured do not vary four inches in length from what I have supposed to be a fair average measurement of the Atlantic Coast animal, viz: seven feet six inches from the tip of the nose to the tip of the tail, after the skin has been tanned.

It should be mentioned, however, that a skin taken freshly from the animal will measure, without stretching it very hard, twelve or thirteen inches in length more than the tanned skin, and consequently the skin of a hunter that he has killed a panther whose skin measures nine feet does not necessarily imply that the creature was much, if any, above the average in size. As to their weight, I cannot speak positively from my own experience, as I have never had the opportunity to weigh one, but judging from the apparent weight of the animal when fitted with the arms, I should say that a panther whose skin when tanned measured seven feet six inches would weigh about 125 pounds.

Since the establishment of the U. S. Salmon Breeding Station on the McCloud River, all large game, with the exception of panthers, has steadily become scarcer and scarcer. When we first settled on the river the black and brown bears, in the fall, used to come down constantly to the river near our house to eat the dead salmon that floated up to the river banks, and we could hardly ever follow the up-river trail to any distance from the house without coming across their tracks. Now a bear track on our side of the river anywhere near the house is very rarely, if ever, seen, and the haunts of the bears seem to have fallen several miles further back into the mountains than when we first came. It is the same with the deer. During the first years of our residence on the McCloud we had to go but a short distance from the house for deer, and almost any forenoon an Indian could go out and get one and return before dinner. Now, as a rule, we expect to get several miles from the fishery to get a deer on our side of the river, though on the other side the deer keep much nearer, as do also the bears. The panthers, on the other hand, were scarce when we came, but have increased and come nearer ever since we have been there. Such a strange statement as this would naturally be received with some incredulity, but the fact is easily accounted for.

Before white men came into this region panthers had to depend entirely upon meat for their subsistence, and the game of country was so rich in game, and in places as another. When white men came they brought domestic animals with them—sheep, horses, cattle and hogs. This changed the game of affairs for the panthers entirely. They found that there was not only other food to be had beside what they hunted in the mountains and forests, but that this new food was obtained with far less difficulty than their former food was, and that it occurred in the most abundance around the human encampment.

It was no trick at all for a panther that had spent his life hunting and watching for the wary and fleet-footed deer, to come down off the mountain flank at night and steal a calf or a cow or a pig from the neighborhood of a human habitation. He always knew where to find them. He was always sure of obtaining one, and was also sure of never failing to secure an easy victim. One can readily see that with white men's farms offering these inducements, the panther would gradually abandon his long and laborious hunts in the mountains for deer and other wild game, and when hungry would come down the mountain side and seek his meal in the rich quarry of domestic animals, waiting for him on the settler's ranch in the valley, and it is easy to see also that panthers, in seeking a suitable dwelling spot for themselves and their young, would not be guided so much by its convenience to places that deer frequent, as by its nearness to some access to the live stock of the ranchman.

The cat family, as is well known, are a curious mixture of boldness and cowardice. They are the most cowardly of all animals by day, when they can be seen. Panthers share this peculiarity with the rest of their family, and trusting probably to their agility, quickness and stealthy softness of their step, they venture at night, when they cannot be seen, into dangerous places that a bear or deer or wolf would never think of going into.

It is undoubtedly this trait of exceptional boldness at night which has kept the McCloud panthers about the river, and caused them to increase in the vicinity of human dwellings. Bears and deer will not come around human habitations, knowingly, by night or day, but panthers and lynxes and wildcats as well, although as shy and wary by day as any animal that inhabits the woods, seem not to be afraid at night of taking any risk of danger from men. Consequently, the panther has been able to range further back into the wild, uninhabited regions on the approach of man, because they do not dare to come near enough to steal his domestic

\*Several months ago I received the skin of a mountain goat to tan, and in cutting it across the back I found it to be, at that place, one inch and a quarter thick. Leammux told me he once shot a goat which had the horn of another's horn embedded in the rump, the skin having closed over it.

animals, and prefer the greater safety of remote regions, the panthers have not only not been frightened off, but have apparently come nearer. This is the present condition of things on the McCloud River to-day. The panthers are nearer, more abundant and bolder than ever. The settler who lives on the ranch just across the south line of the reservation which we occupy, said last fall that the panthers came down to his house almost every night, and the ranchman just above the reservation also had a visit from them at least three times a week.

One night when Mr. Myron Green was returning from the fishery to the trout ponds four miles above, an animal which he supposed to be a panther sprang from a tree to the ground just behind him, and wounded his dog which was following him.

Summer before last a panther came to the house of our next door neighbor on the west side of the river, and was slain in a tree close to his house.

One day when Mr. Loren Green was going from his house at the trout pond, to his boat to fish, a panther followed him for several rods through the adjoining bushes. Mr. Green thinking it was a large dog. When Mr. Green, after examining his lines in the river, came ashore, the panther met him at the boat landing, and was soon after joined by another panther near by. Mr. Green barely escaping from them by throwing his hook quickly back into the river, and even then the panther watched him from the shore for ten or fifteen minutes, during which time he was joined by his mate. Not very long ago, as our stage was coming down the road, the driver saw three panthers trotting in front of him. Having stopped the frightened horses, several of the passengers, who were returning from a hunting trip, got out and fired at the panthers with their rifles.

At Upper Soda Springs, which is about forty miles from the fishery, is, in respect to panthers, subject to very similar conditions, a child of the hotel proprietor was seized by a panther a very few yards from the house, and was shot as it was in the act of carrying the child off.

A few seasons ago, some stockmen drove a band of horses and colts into the McCloud River cañon, for the purpose of pasturing them there through the summer. The panthers soon killed colts, and the stockmen, and finally one of the stockmen sprang upon a horse when the owner was riding on his back. The rider barely escaped with his life, and the next day the stockmen drove their horses out of the valley to safe quarters.

These instances show how the panthers must have increased in our neighborhood, for when we first came here we did not hear anything in particular about them, and were not molested by them. Now they annually destroy considerable numbers of hogs, pigs, calves and colts. They are most destructive to the hogs, so much so that those having hog ranges in the vicinity, when computing the expected increase of their band, allow 20 per cent. for the annual loss by panthers.

It is difficult to acquire much knowledge of the habits of panthers in their wild state. There are some peculiarities about the McCloud River panthers, however, which have been noticed. They will always run from a dog, no matter how small he is. An undersized terrier is as good to chase a panther with as the largest bulldog. When the panther finds that the dog is closing upon him, he will always jump up into a tree. He will not climb the tree like a bear, but will jump up to one of the branches, and I have heard old hunters say that they had seen panthers jump over twenty feet of perpendicular rock into a tree. One blow of the panther's paw would kill the dog perhaps, but the panther never stops to give the blow. It is quite possible that the panther jumps into the tree so as to be in a position to pounce upon the dog when he comes up, but whether this is their reason for resorting to a tree, or whether it is simply because it is the cat's nature to run, as it is the nature of the dog to chase, is the fact in either case that the panther always runs from the dog, no matter how small he is, and never turns to face him.

The behavior of the panther is no less peculiar after he has jumped into the tree, for when there, he watches the dog constantly, no matter how near the hunter comes up to him. This makes it comparatively safe and easy thing for the hunter to shoot a treed panther if the hunter has a dog with him, for while the panther's eyes are fixed on the hunting and chasing dog, the hunter can go near as he pleases, and take as slow and deliberate aim as he pleases. As long as the dog remains barking under the tree and absorbing the panther's attention, the hunter is perfectly safe. All he has to guard against is wounding the panther without actually killing or wholly disabling him, in which case the victim might in his dying struggle encounter the hunter and do him a serious injury.

Panthers seldom come out of their lair by day. It is believed that they are in the habit of hiding in trees in the daytime, partly perhaps for safety, and partly for the purpose of watching for food. On the McCloud River, however, I believe they spend the day for the most part in the inaccessible parts of the limestone cliffs which cap the mountain summits across the river from the fishery. These limestone cliffs and pinnacles are high, steep and very difficult of access. One of the panther's trails ran up the side of Mt. Perschou. The panthers' tracks grew thicker and plainer as the mountain-side grew steeper, and the limestone cliffs came nearer. When about three thousand feet up the mountain became very steep and precipitous and ended in a blank, smooth, vertical wall of rock about twenty feet high. The panthers' tracks continued up to the very base of this rock, which of course having reached, they began to climb the top of it and once there they were safe from everything. No Indians could follow them there, no dogs could track them there, no white hunter with his rifle could reach their inaccessible retreat. In these cliffs they were safe.

It is my impression that the panther, finding so safe a retreat there, and one that is at the same time, so near their food, make these limestone cliffs their home, and rear their young there. At least, if the panthers' tracks that lead to our houses, come from these cliffs, and the tracks that lead from our houses return to the cliffs.

It would seem that a panther's life when he does not voluntarily risk it by excessive boldness must be extremely free from danger. No denizen of the mountains or forests is his equal. In California he is called a lion and he is well named, for like a lion he is monarch of the forest. It is generally believed that the grizzly bear is the most powerful of the wild animals of America, but the McCloud River Indians say that the panther always kills the grizzly when they have a fight. They say that the grizzly bears are afraid of the panthers, and that the panthers spring on their shoulders and cut their throats with their teeth. I imagine,

however, that a panther never attacks a grizzly bear face to face. I myself have seen places in the mountains where the ground has been torn up by what must have been a desperate conflict between a panther and a bear, and the Indians have found dead bears that panthers have killed, but they say they have never found dead panthers that bears have killed. The Indians say that there seems to be the same natural antipathy between panthers and bears that there is between cats and dogs, and that the panthers are always trying to kill the young cubs of the bears, and the bears are always seeking to kill the panthers' kittens.

Panthers are seldom killed on the McCloud River. I have heard of only one or two that Indians have killed with their arrows.

It is difficult to poison or trap them, as they are so suspicious of the bait. I have heard, however, of many panthers being killed by poison in other places, and I suppose that the McCloud panthers get hungry enough they will be poisoned, but while food is plentiful, I think as it is now, it is difficult to poison or trap them. One exception to this should be mentioned. They are in the habit of burying anything that they capture and do not eat up at the first meal. For instance, if a panther gets a deer or a hog he eats what he wants, and then digs a hole in the earth with his claws and buries the remainder. If now anyone should find the hole, and dig it up, he would find the panther would be killed, for he will eat the meat that he has buried himself. I will merely add in conclusion, that in consequence of the difficulty of killing the panthers, they are likely to maintain their hold for many years yet in the limestone cliffs bordering the McCloud River, for although settlers are now beginning to come into this region, the chief effect of these settlements upon the panthers will be to force them to migrate to other parts of the country, and to drive off the hereditary enemy of the panther, the bear, while the rocky retreats where the panther makes his home will remain as inaccessible as ever. LIVINGSTON STONE.

## THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH

FAMILY LARIDÆ: GULLS, TERNS, ETC.

266. Pomatorchus Lestrin—*Lestrin pomatorchus* Aud.; *Stercorarius pomatorchus* Ridg. 697, Cs. 765. Mr. Boardman mentions this species as "rather common" in autumn and winter in the Bay of Fundy. The species is probably of regular winter occurrence off the coast of Maine.

267. Richardson's Lestrin—*Lestrin richardsoni* Aud.; *Stercorarius crepidulus* Ridg. 698; *Stercorarius parasiticus* Cs. 766. Not common. September 22, 1874 an immature lestrin of this species was brought to me for identification. It was shot at Scarborough, and the specimen was preserved by a taxidermist of Portland.

268. Bunt's Lestrin—Longtailed Lestrin—*Lestrin parasiticus* Aud.; *Stercorarius parasiticus* Ridg. 699; *Stercorarius buntii* Cs. 767.—Apparently the most common of the three species of lestrin known on our coast. The lestrin is locally known to fishermen as "marluspikie" or "gull-chaser," being so termed on account of its long pointed tail and its habit of chasing the gulls, and compelling them through fear to migrate. It is usually captured food, upon which the voracious bird makes a feast.

The German word of "*Jäger*," meaning hunter, is commonly used by ornithologists, and our best American authorities use this noun to designate a bird of any of the various species known to this continent.

### GULLS.

269. Glaucous Gull—*Larus glaucus* Aud., Ridg. 660, Cs. 768.—Occurs along the coast in winter, chiefly off-shore. Not very common, and adult birds in perfect plumage of maturity are rarely seen here. This is one of the largest gulls, being nearly or quite equal in size to the great black-tailed gull. The Glaucous gull never has black markings upon the wing tips, and the plumage of the young or immature birds is light brownish gray.

270. White-winged Gull—*Larus leucopterus* Aud., Ridg. 661, Cs. 769.—Much more common than the preceding named species, and not infrequently abundant. Gulls of this species are seen in flocks during migrations, associating with other gulls in winter, and sometime frequenting the harbors. The gray immature or young bird resembles the "herring" or silvery gull of similar age, but is much lighter colored, especially on the wings. Both immature and adult birds of this species may usually be distinguished from other gulls, by a familiar observer, even at quite a distance with the aid of a field-glass, by the absence of black upon the wing tips. But there is a phase of plumage, immediately preceding that of perfect maturity, in which this gull has the outer surface of the first four or five wing-feathers (primaries) marked with a dusky or ash-gray color, more or less obscure, but sometimes quite prominent and resembling the wing-markings of the silvery gull, and although never pure black as on that species, yet so dark as to be in marked contrast with the pale pearl-blue of the greater portion of the wing. I presume this to be the form to which Dr. Elliott Coues alludes in his "Birds of the Northwest," (page 624), as *Larus "chaleporeus,"* described as "exactly like *leucopterus*, except on the primaries, which are ashy-gray, with rounded white apices." Dr. Coues adds, "This is a very peculiar character of *glaucous*," or *glaucous-winged* gull ascribed to the Pacific coast of North America.

271. Black-backed Gull—*Larus marinus* Aud., Ridg. 663, Cs. 771.—Common along the coast, except during the summer. None breed here. This is the largest of all the gulls known in this country. It frequents the outer islands and rarely, if ever, is found inland.

272. Silver Gull—*Larus argentatus* Aud.; *Larus argentatus sabiniensis* Ridg. 664a; Cs. 773.—Abundant. Some remain along the coast throughout the winter. Gulls of this species regularly breed here, but not in large numbers. Although usually breeding in communities, isolated pairs are occasionally found nesting. A few breed about the inland lakes of Maine. The immature birds are laid down in July and August in May. The three eggs are laid in a single row, and are of a light greenish gray, very gently in color, proportions and size. Some are more blotched or spotted, others nearly immaculate. The colors vary from light blue, ashy gray and green to various shades of brown, green and brown being the prevailing colors. The eggs equal in size those of the domestic Turkey, and form a staple article of food in some localities. They are considered of superior flavor to the domestic hen's eggs,

and command a higher market price. Many thousands of these gulls' eggs are annually taken upon the islands of the Bay of Fundy and coast of Nova Scotia and New Brunswick. In some instances the privilege of taking the eggs is leased by the owner of an island, the terms requiring that no eggs shall be taken after a certain date, usually June 25, thus allowing time for the birds to lay more eggs the same season and rear their young, and no birds are killed during the nesting time. When boiled the yolks of their eggs are a reddish hue. The "white" portion has a bluish tinge, and is less agreeable than the "white" of a hen's egg. The custom of ceasing to collect the gulls' eggs after June 25 is both wise and humane, for at that date nearly all of the nests have been twice robbed; but the birds will lay more eggs, although often less than the complement of three, and the season is yet long enough for the successful hatching and rearing of the young. The strict observance of this custom prevents the birds deserting such localities, and they will return to the same nesting places year after year. Upon one island that I have visited, a valuable eggling privilege has been developed by careful protection. While large numbers of gulls and elder ducks were deserting neighboring islands where they were indiscriminately robbed and killed, their numbers rapidly increased upon the island referred to, until an annual yield of several thousand eggs was attained and kept up. Another related to this is the Bay of Fundy and Labrador in 1833, that he found the herring gulls so wary that even at their breeding places but few could be obtained, not more than a dozen having been shot by six men in a single day. I have found them thus wary at breeding places, which had been habitually shot at. But upon one of the same islands visited by Audubon, the herring gulls were so tame that the hunters shot at the gulls upon their nests without disturbing them, while others were circling about within easy gunshot range. This change was brought about solely by judicious protection of the birds. After the breeding season, and when the young birds have become well-grown and fully fledged, they are frequently killed and eaten by the fishermen and others.

The size, material, and location of the nests vary greatly. Some that I have seen were made of mud, others of sticks, in size. Others were no larger than a man's hat. Some were built at the tops of spruce trees thirty feet or more from the ground, some upon the ends of the branches and some upon fallen trees. Such as are placed upon trees are generally composed of twigs, moss, and dry grass, and are frequently used and improved by additions for several years in succession. Many nests are placed upon or under logs of upon the shore, and the nests were covered with a swale, or at the shore upon driftwood and the bare rock. The nests are usually well hollowed, with an inside diameter of six or eight inches. The average size of the eggs is about two and three-fourth inches in length by two inches breadth. Many nests are smoothly lined with grass, but none with feathers. I once found a nest upon a ledge and in the shadow of an overhanging rock, composed entirely of green wet seaweed, and containing a freshly laid egg. Unlike many seabirds, the gulls do not pluck themselves so that the bare body may rest on the eggs during incubation.

Formerly great numbers of silver gulls were accustomed to breed upon the island of Grand Menan, in the Bay of Fundy, but they have been driven away, excepting comparatively few that breed upon inaccessible places about the island. The cause of their departure is a matter of dispute, but it is said to have been caused chiefly by foxes. About eight or ten years ago several foxes were liberated upon this island. A person who had been accustomed to take eggs whenever he could find them, was forbidden by the owner of the land most resorted to by the gulls for nesting.

In a spirit of revenge this poacher of eggs deliberately poisoned some live foxes and liberated them upon the island. None have hitherto been known there. These foxes multiplied, and the gulls, as also the thrushes and other small birds, decreased in a marked manner in consequence. The foxes destroyed the eggs and young birds, and the adults whenever possible. Nor were these depredations confined to this one island, but extended to such of the adjoining islands as were accessible to the foxes, by way of the flats at low tide, or by ice in winter.

The spite of an individual possessed of the spirit of the notorious "dog in the manger" was thus gratified at the expense of all the inhabitants of these islands, to whom nature had supplied an annual harvest of wholesome food, and the destruction of the insectivorous birds by the foxes is a serious matter to the farmers. A year or two after the introduction of the foxes to Grand Menan one of the islands was killed, upon a adjoining island, and the person who had brought this curse to the locality actually had the effrontery to claim remuneration for the loss of "his fox."

Gulls of this and other species are locally known as "gray gulls" along the coast of Maine. The eggs of the silvery or herring gull are hatched early in June, when the nest has not been robbed. The young are covered with dark gray down that forms a thick warm covering for the birds until fledged. If the nest is on the ground or rocks the young birds can leave it and actively run about, catching insects expertly when very young. They grow very rapidly, and are fed by the parents until fully fledged, when the plumage is of the same general dark gray color as the down beneath it. This gray suit is worn for a year, but it gradually becomes a lighter shade.

When the second plumage color of the first year, the gull has hazel eyes, bill nearly black, and the feet are of yellowish lead color. When the second spring arrives the breast and belly have become white, the head nearly white, the bill yellow, the mantle bluish. The tail is now nearly white, but has a broad brown bar across its tip, by which one can readily distinguish the comparative age of the bird. A few gulls of full size at two years of age, and a few of the same age full mature and breed, but the following spring, when the plumage, including head and tail, is pure white, except the "mantle" of light pearl blue color that extends across the back, and the wing tips, which are black, with white subapical spots. The bill is then of a clear, bright yellow color, with a carmine spot on the lower mandible. The eyes are pale straw color, eyelids yellow, and the feet color.

No gulls of immature plumage are found breeding. Such birds usually associate in communities during the breeding season, however, and when their haunts are visited by man they will often manifest as much apparent alarm as if nests had been made, and I have seen them show great concern about the nests of other gulls, darting down and circling about with repeated cries even after the real owners of the eggs or fledglings had ceased to do so.

The most ordinary cry of the gull consists of their short notes, "ac-ac-ac," repeated at frequent intervals. But gulls,

as well as other birds, have a varied and expressive language. When suddenly alarmed their cries are very discordant, but when undisturbed upon their nests a soft, cooling cry, not at all unpleasant to the ear, is sometimes uttered, especially at the approach of a mate. On a gray November day, when the air is clouded and chilly, and the earth brown and cheerless, the cries of the gulls have a dismal sound, yet I have often been assured of fair weather by such cries; and I have felt oppressed by their ominous silence before an approaching storm. But how exasperating are their cries of warning when one is attempting to approach a flock of geese or ducks for a shot. Not content with betaking themselves out of danger, the gulls when once fully alarmed will circle about in the air uttering their cries, and when the danger is over, and as such are recognized by fowl other than of their own species. The ducks and geese that frequent the same haunts as the gulls so well understand the language of the latter that no attention will be paid to any cries except those of warning.

The silvery gulls, but no other species of gulls, are to be found on the coast of Maine throughout the entire year. Great numbers migrate hence in autumn, but the places of their wintering are filled with birds that later on migrate to northern breeding places. At times, when extremely cold weather covers the shores and flats with ice, the gulls all leave, but return so soon as the ice is gone and an abundance of food can again be obtained. Although the gulls are the scavengers of the sea and not fastidious about their food, they subsist chiefly upon shellfish and small fishes, and fish weirs are sometimes frequented by them for the young herrings, etc., that are to be found. I have seen these gulls perched upon the stakes of a fish weir, but never upon them, except during the summer at their breeding places, where the woods will be white with them. But at no other time, even in the same localities, are they accustomed to alight upon them.

During the summer the shellfish known as "sea urchin" forms a staple article of food for them, and the gulls can extract this fish without breaking its shell. Not so with clams and mussels, however. These are taken up in the air by the gulls and are dropped upon the rocks for the purpose of breaking the shells. Although these shellfish form the common food of the birds, the gulls never swallow them with the shells whole, as do ducks of various species.

There is a popular fallacy that gulls and vultures are gifted with the sense of smell to a wonderful degree, and can scent their food far away. It is a fact, however, that the sense of smell is barely developed at all with birds. But the gulls have very keen vision, and when one espies food and flies in the air over it, the motions of that bird betray the fact to either of its species far away. These hasten on wing to the spot, and by their movements show to gulls still more remote that some prey has been discovered. A lot of offal thrown from a vessel at sea will immediately attract the gulls near by, and perhaps but one or two birds will at first be seen. Yet soon others will make their appearance, one after another, coming from all directions, until a host is assembled.

Gulls may often be decoyed by various methods. One of the most simple and successful that I have tried, is by means of a pair of gull's wings. These should be cut from the bird close to the body, and placed with their upper edges together. Then grasping them about the joints with one hand, they can be made to extend and close by alternately clenching the hand and partially relaxing the grasp. The operator should be well hid from view and only the wings exposed. The motion will attract the attention of a gull hovering at a distance, and by its resemblance to a gull hovering over its prey, frequently decoy the bird sufficiently near for a killing shot.

273. Ring-billed Gull—*Larus zonorhynchus* Aud.; *Larus delawarensis* Ridg. 669. Cs. 778.—Common during migrations. None breed here.

274. Kittiwake Gull—*Larus tridactylus* Aud.; *Rissa tridactyla* Ridg. 658. Cs. 733.—Common along the coast during migrations and in winter. None breed here.

275. Laughing Gull—*Larus atrifrons* Aud., Ridg. 683; *Chroicocephalus atrifrons* Cs. 780.—Not common. Occasionally a small community is found breeding on the coast of Maine, and apparently this has occurred with some regularity within the last few years. The species occurs here as a summer visitant from the South. It has occasionally been seen in Casco Bay, and as far east of the bay of Fundy. Mr. Boardman reports there are "very plenty" in the summer of 1879 in the latter region.

276. Bonaparte's Gull—*Larus bonapartei* Aud.; *Larus philadelphia* Ridg. 675; *Chroicocephalus philadelphia* Cs. 788.—Abundant during migrations, and a few immature birds remain along our eastern coast in summer. None of this species breed here. They arrive from the South late in May, and sometime acquire the perfect plumage of the breeding season as they are passing further north. I have seen mature birds of this species in Casco Bay as late as June 11, and observed adult birds on the eastern coast of Maine upon August 3 of the same year. Yet none are known to breed here, nor upon any of the Grand Menan group of islands in the Bay of Fundy. The southward migration extends throughout the autumn, and small flocks of these gulls tarry not uncommonly on our coast until December.

The first arrivals from the breeding places in August usually consist of a few male birds, which remain here and pass through the summer moult. The species becomes more abundant here in October and November.

These small gulls are quite unsuited, and may be easily approached upon the water by a boat, or decoyed by waving a white handkerchief. They are gregarious at all seasons, and small flocks are to be seen about our harbors and estuaries industriously catching snails during November. The fish are procured by the gulls flying over the water at a slight elevation, and suddenly pouncing upon their prey. They do not plunge into the water, however, in the manner of the terns.

277. Sabine's Gull—*Larus sabini* Aud.; *Xema sabini* Ridg. 677. Cs. 790.—Very rare. While watching some Bonaparte's gulls near Bluff Island, Scarborough, Me., May 31, 1877, I observed a gull of similar size and mode of flight to the one upon which the attention of the party was fixed. It succeeded in decoying this bird near enough to my boat for a shot, and secured the rare specimen. It was an adult female Sabine's gull, having the perfect plumage of the breeding season.

In May, 1878, my friend, George A. Boardman, Esq., procured a fine specimen from Indian Island, near Eastport, Me., an adult very nearly in perfect plumage. It was the same of the adult male of the bird that had been captured but a very few specimens within the limits of the United States has been publicly recorded. Sabine's gull may be distinguished from other small gulls, even when

flying, by the black outer edge of the wing. Otherwise it resembles the common Bonaparte's gull when on the wing.

## STERNINÆ. TERNS.

278. Gull-billed Tern—*Sterna anglica* Aud., Ridg. 679. Cs. 792.—Not common. Of irregular occurrence along the coast. I have shot terns of this species at various times in Maine, where it appears to be of rather rare occurrence, and the species is nowhere abundant upon the Atlantic coast of America. A flock numbering several dozens visited the marshes at Scarborough in September, 1868. I shot three specimens from this flock and could have easily killed many more. Mr. Boardman reports a single specimen taken near Grand Menan Island in August, 1879. I procured an adult specimen at Scarborough, Me., May 21, 1881, but saw none other of the species at that time.

279. Caspian Tern—*Sterna caspia* Ridg. 680. Cs. 793.—Rare. This tern is here named upon the authority of Mr. Boardman, who reports its occurrence upon our coast. Specimens have been procured by him at the mouth of the St. Croix River so recently as the autumn of 1877.

280. Wilson's Tern—*Sterna hirundo* Aud., Ridg. 681. Cs. 797; *Sterna fuscicollis* Ridg. 680.—Abundant in summer. Breeds commonly along the coast. All the terns are locally known in Maine as "mackerel gulls."

281. Arctic Tern—*Sterna arctica* Aud.; *Sterna macrura* Ridg. 687. Cs. 799.—Abundant in summer. Breeds commonly along the coast. Although associating freely with the Wilson's tern, these two species do not intermingle their nests, although sometime communities of both are found breeding upon one small island. In such instances each species shows as much apparent concern about an intrusion upon the domains of their neighbors as upon their own. For a perfect identification of the eggs the collector should observe the birds upon them. The "variety *Portlandica*," which has black bill and feet, is of not uncommon occurrence here.

282. Dougall's Tern, Roseate Tern—*Sterna dougalli* Aud.; Ridg. 688; Cs. 800.—Not common. Although abundant along the coast of New England further south, but few terns of this species visit Maine, and none are known to breed here.

283. Least Tern—*Sterna minuta* Aud.; *Sterna antillarum* Ridg. 690; *Sterna superciliosa antillarum* Cs. 801. A rare straggler from the south. Of irregular occurrence only.

284. Sooty Tern—*Sterna fuliginosa* Aud., Ridg. 691. Cs. 804.—Accidental; a single specimen reported by Mr. Hathorn December 1, Bull. Nat. Hist. Club, Jan. 1880, as obtained by Mr. H. H. T. in the town of Parkman, Piscataquis county, Maine, on October 5, 1878. This bird was "picked up in the road and died next day."

285. Black Tern—*Sterna nigra* Aud.; *Hydrochelidon lariformis surinamensis* Ridg. 693; *Hydrochelidon lariformis* Cs. 806.—Rare. Of irregular occurrence along the coast, usually in autumn. I shot a specimen at Scarborough, Aug. 18, 1865. Other specimens have been shot there at various times. The species was taken at Scarborough, in June, 1878, and in September of the same year. In the autumn of 1879 Mr. Boardman obtained three adults from the Bay of Fundy, from Grand Menan Island. In Bull. N. O. Club, July, 1882, two specimens are recorded (by Nathan Clifford Brown) for Maine, taken in the autumn of 1881, one at Scarborough, and one at Well's Beach.

286. Black Skimmer—*Rhyacionia nigra* Aud., Ridg. 696. Cs. 809.—Rare. Of occasional occurrence only, and no record of its appearance so far north as Maine previous to 1879. In the early autumn of that year a number were shot on our coast. Mr. Ira S. Shalis, of Wells, shot one of two seen at a creek of Well's Bay, Aug. 28, 1879. Mr. Boardman reports seven specimens shot in the Bay of Fundy, where many are seen during the autumn of the same year. Mr. Harry Merrill informs me of one that was shot by a fisherman near Martinique Island, Me., in the summer of 1881, and the specimen was sent to Bangor.

[TO BE CONCLUDED.]

## SNAKE NOTES.

I AM reminded by your notes in FOREST AND STREAM, for April 5, of a large black snake, which I killed near Farmington, Conn. It was driving with a lady and saw his snakeship cross the road just in front of us, his head nearly reaching one side of the narrow mountain roadway before his tail reached the other. The horse was a quiet one, so, my companion assenting, I armed myself with a stone and followed the snake into the bushes, where I was fortunate enough to give him a mortal hurt. I had no means of measuring him long with my whip, which was not so long as he was, but one end of the rope, with a lady's hand, nearly reaching home, made him seven feet and eight inches long. I think he must have been fully eight feet, as the contraction of his muscles prevented him from lying perfectly straight when I measured him. He was the largest native New England snake I ever saw, and as a constrictor would have been a formidable antagonist.

This reminds me of the speed of the black snake. I was once passing through some open woods in the same vicinity when I came upon a large and beautiful specimen. I should say that he was some six feet long and of a glistening blue-black. He at once took to flight and I after him. I was a fairly good runner then, but he went at least twice as fast as I could, and soon disappeared. There is a tradition in that region of a snake called a "racer." I know it is laughed at by naturalists, but I have never been able to rid myself of the idea that this was something more than the ordinary blue snake of the Northern States.

CHARLES LEDYARD NORTON.

PHILADELPHIA, April 6.

SPRING IN MASSACHUSETTS.—Newton, Mass., March 29.—Spring at last seems to be near us, for already we have noticed the return of our feathered friends from the South. On Sunday, February 18, while driving along beside a meadow, we saw the first robin, and the poor fellow seemed to be badly used up with the ice and snow on the ground, and the raw, cutting wind. Since then I have seen more, and bluebirds also. The first purple grackle of the season was noticed on Tuesday, the 27th inst. It has been a very hard winter, and we fear that the quail have suffered, as we have not heard of any being seen since December.—TOM ALLY.

Snow Buntings.—Ferryburg, Vt., March 31.—Tell "J. L. D." that it is neither uncommon nor common to see snow buntings alight in trees here. I have often seen them so perched.—AWAHMOOSE.

## Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such notices?

## DEER HUNTING IN THE ADIRONDACKS.

By Jos. W. SHURTEN.

## CHAPTER I.—ROUTES.

ONE prominent trait of the true sportsman is the habit of "fighting his battles over again." This habit is acquired not from a love of boasting or desire for notoriety, but from a generous desire that all mankind may be sharers in the pleasures which are so dear to him.

This desire, coupled with a wish to oblige my sportsman friends who have asked for a history of our two last sporting trips, leads me to again attempt to picture the sport of "deer hunting" in the Adirondack Highlands. As these hunts are necessarily very much alike, I prefer to avoid the risk of wearying the reader with repetitions and simply give such data of our trips as in my judgment may prove of interest, supplemented by a description of the methods commonly employed in hunting this noble game which may interest those who contemplate enjoying the sport at some time in the future.

Our party for the fall of '81 consisted of Perry Ross and Edward Grady, of Gausewauke; George Edmonds, of Battle Creek, Mich., and myself, with "Mingy" Sprout as our *chef de cuisine*, royal, good fellows all. We camped three weeks at Indian Clearing on Moose River, Hamilton county, N. Y. During this time we killed twelve deer, beside a quantity of other game, among which I would mention several specimens of the genuine spruce grouse or "Canada partridge," a *rara avis* in this latitude. A short time before our return our party was reinforced by the arrival of Messrs. Herbert and Wesley Spott and John Washburn, of Fortville.

The personnel of our party last fall was Samuel Hewitt and Benajah Allen, of Stillwater; John Chase, of Wilton; George Edmonds, of Battle Creek, Mich., and myself. The scene of our operations was located on Cedar River, our "old hunting ground." Although deer are not as plenty here as "further in" on Moose River, still there are enough for good sport. Our party consisted of five, three of which were magnificent specimens. We were very kindly taken in and cared for by "Rich," Potter, whose place is located on the Cedar five miles above Cedar River Hotel. I would say in passing to those who desire to hunt this locality, or Moose River, you cannot do better than to place yourself under the guidance of Mr. Potter. He is not only an expert hunter, but is also an old hotel keeper and knows the wants of his patrons, and has long ability and desire to supply them of reasonable prices. His house is large and comfortable, and his outfit of dogs, canoes and other impediments will be complete for next season's sport. And lastly, but not least, his wife is not only an intelligent lady, but is also an excellent cook, a fact to be appreciated after starving at some of the resorts for sportsmen in that vicinity.

Moose River, the paradise of the deer-slayer, is reached via Adirondack Railroad to North Creek, thence by stage to Cedar River, thence by private conveyance eighteen miles up the Cedar, three miles across the divide to Moose Lake, and nine miles down Moose River to the "Indian clearing," which is fifty miles distant from North Creek. The road, I presume it is called a road through courtesy, for the last fifteen miles of the route is formed by simply cutting the trees and hauling the logs from the line of travel. Rocks, roots of trees, and mud holes, alternate with distressing frequency. "Variety is the spice of life" is a true saying, but when it consists in being bounced about upon the "soft" side of the axle of a lumber wagon that is continually thumping over "pebbles," slightly larger than the one with which David slew Goliath, or climbing over huge rocks, veritable boulders, only to be soured in a mud hole beyond, one gets to thinking that that sort of "spice" is not the most desirable thing in the world. But *nil desperandum*, it leads to the "happy hunting grounds."

"Indian Clearing" is about three miles in extent by one mile in breadth. It is almost entirely covered with huckleberry brush, which yield large quantities of berries in their season. It possesses an interest from the fact that there is a legend respecting it to the fact that it was made by the Iroquois Indians prior to the French and Indian war. "The most probable theory of its existence is that it resulted from one of the tremendous forest fires which occasionally sweep over such wilderness regions. Whatever the cause may have been the cause of its existence, it certainly requires but little effort of the imagination, as one floats over the murky depths of the "upper" or "lower stillwater" and listens to the weird hooting of the owl, the croak of the raven or the splashing of trout, to picture this as once one of the favorite stamping-grounds of the scalp-hunters, or in fancy to see the traditional birch-bark canoe and painted warrior, plumed with eagle's feathers, "gliding down the winding stream," and Rock Dam. The primitive stillwater, whatever it may be, of which I am writing, is the outlet of Moose Lake, a beautiful sheet of water embosomed in the primeval forest and surrounded by mountains, which stand like grim sentinels jealously guarding the gem which mirrors their rugged grandeur. The river flows westward in a succession of rapids and stillwater. The most important of the latter are termed the "upper" and the "lower," each being about one and one-half miles in extent. The "upper" stillwater, which is opposite of Indian Clearing, has at its lower extremity an artificial dam, built by William Wakely to facilitate lumbering operations. The lower stillwater is about one mile below the upper, and is pronounced by those whose opinions are entitled to respect "the most beautiful stretch of running water in the Adirondacks," and in this opinion I fully concur. At its lower extremity is a natural dam of rocks, and Rock Dam. The primitive "upper" stillwater flows from Moose Lake, to this point, as: From the north, Silver Run, five miles below Moose Lake; Summer stream at Indian Clearing, and Red River, at Rock Dam. From the south, Otter Creek, opposite Indian Clearing and Indian River, at the upper end of lower stillwater.

There are as yet but limited facilities for enjoying sport at this point on the Moose. The well-known guide "Lige" Camp is the proprietor of a well-appointed house, and the accommodation of sportsmen, which is pleasantly located at Moose Lake.

After testing his hospitality, I can say his house is neat

I have now described the hunting grounds and routes. The next in order will be a consideration of the methods employed to kill deer.

## CHAPTER II.—STALKING.

Deer stalking, or as it is commonly called, "still-hunting," is in my estimation so far superior to other methods which are employed for the "taking off" of this noble animal that I think it proper to place it, where it unquestionably belongs, at the head of the list. I regard it as superior because it not only furnishes constant employment for both brain and muscles, and a chance for the display of skill that can only be acquired by long study and practice, but it brings its votaries into closer contact with nature in her varied moods. Along the babbling brooklet, through grand old forests, by thundering cataracts or gleaming lakes, up towering mountains, until from their summits above the clouds, or down the cold, mountain billows beyond the mountain billows, rolling down to the precipitous cliffs, until their outlines are lost in the distant blue of the sky. 'Tis these scenes and associations fully as much as the pursuit of his game that yields the deer stalker that fascinating and subtle pleasure, which having been once tasted, is ever after eagerly sought, and never closes.

like the trade winds, but to run in a steeper position. The greyhound's pace with his back parallel to the ground and his face within an inch of it, for a mile together. He should take a singular pleasure in threading the seams of a bog or in gliding down a burn like an eel. Strong and pliant as the ankle he should indubitably be, since in running swiftly down precipices picturesquely adorned with sharp-edged, water-worn stones, his feet will get into awkward cavities, and his legs will be liable to the risk of breaking so much the better. He should rejoice in wading through reeds, reeds, and be able to stand on water-worn stones unconscious of the current; or if the waves are too powerful for him, when he loses his balance, and goes floating away on his back, (for he has any tact or sense of the pictures-que he will fall backward) he should hold his rifle aloft in the air, lest his powder get wet. As forsleep, he should be a stranger to it, and if a man gets into the slothful habit of laying in bed, he should be a stranger to it at a time, I should be glad to know what he is fit for? Strong in his lungs, he should be able to be, and at times gracefully without a pulse—Hyacinthine curls are a very graceful ornament to the head, but I leave it to a deer-stalker's own good sense whether it would not be better for him to shave his crown at once than to risk the loss of a single shot during the season. As to mental endowments, he should have the qualifications of an Ulysses and a Philidor combined. Vary and circumspect, never in a hurry, but quick, surveying all his ground like an able general before commencing a campaign, patient, suspense and disappointment, fertile in conception and rapid and decisive in execution. He must be brave to attempt, he must have fortitude to suffer. What more can be required for the greatest undertakings?"

We will now clothe Scrope's ideal in a close fitting suit and cap of soft woolen goods, light gray in color, incase his feet in buckskin moccasins, place a breech-loading double shotgun and rifle, or a repeating rifle in his hands, and he now stands before us a typical deer stalker, fitted by nature and education to instruct us in the mysteries of the craft.

It is morning. The east is flushing crimson with the light of a new day. The wind, coming out of the west, causes the giant trees of the forest to writhe and twist as if in mortal agony, while its roaring amid their tops, commingling with the sharp creaking of their limbs, completely drowns the stealthy step of our deer stalker, who, having partaken of a substantial breakfast, is now ready for the conflict. There is no doubt or hesitation in his mind. He is full well he knows that this tempest will cause the deer to seek the shelter of the valleys and the eastern slopes, that it has rendered their acute sense of hearing useless to them for the time, and that if he is careful to keep to leeward, it will bear far away from their delicate nostrils the tell-tale taint which otherwise might warn them of his approach. He is now in the heart of the forest, and is looking southward. To the west, and running parallel with his course, is a deep and sheltered valley, and beyond that more ledges, which form the base of a towering mountain peak.

He now moves slowly forward. There is no motion of his arms, no swaying of his body, but just that slow gliding movement. Remove your gaze from him for an instant. It is with difficulty that you again distinguish him from the snow-laden trees and rocks with which he seems to blend. With eagle vision he scans every object in range of his sight. At last he comes up to a frosh "trail." Several deer, in hunter's parlance, "a family," have passed along the valley and are now feeding on the hillside. He has formed a confidence born of experience. But, hold. He has reached a point where the trail zigzags about; he notes where several green twigs have been freshly cropped, and he knows that he is nearing the game. He cautiously re-ascends the ledges to his right, and, taking advantage of every commanding point, scans the valley and the hillside beyond. At last he is rewarded by descrying, some thirty rods ahead, on the opposite side of the valley, the dark form of a deer dimly outlined against the sky. He has found the quarry he has encircled. Does he pitch the gun to his shoulder and recklessly blaze away? Not he. That would be the act of a novice. Subduing his delight, he carefully notes his surroundings. About fifteen rods ahead, and a little to the right, is a projecting spur of rocks. Slowly he sinks to the ground, worms himself through the snow until he has the rocks between himself and that dark form, then slowly rises to a stooping position and approaches until he can look directly at the quarry. He is now within twenty rods of the deer. He has him! But! Here he hesitates a few paces to the right, standing under the top of a prostrate spruce, in full view, is an old doe. Quick as thought the muzzles of the gun are swerved until the sights bear upon her shoulder,

and the trigger is pressed. Before the smoke of the discharge cuts off his view the stalker sees the deer give a convulsive spring, and knows his shot is fatal. And this is not all that he sees. With a snort that breaks with startling force upon the air a lordly buck springs into view.

Old Tawny's forked black springs into view. The animal is a magnificent creature, as he stands with head erect, sparkling eyes, distant nostrils, and every muscle in tension, the very embodiment of conscious power. Language fails me. Two fawns go bounding away and disappear so quickly that the eye almost fails to convey the intelligence to the brain. Again the deadly rifle scuds forth its messenger of death and the stricken monarch staggers. But the graceful limbs that but an instant before were so full of life and vigour are now useless, and the lustrous eyes are glazing, and the pulsation of the brave heart is stilled forevermore. The stalker remains concealed in his position. It is not long before he discovers the head of one of the fawns away on top of the ledge to the east, which overlooks the scene of carnage. With perfect deliberation the stalker lays the gun across a rock, and the deadly rifle adds another victim to the list of the slain. The ringing report is not yet ceased to reverberate when the other fawn springs from a thicket directly in the rear of the stalker and comes bounding along like a rubber ball through the valley at his left. The stalker springs to the edge of the ledge, instinctively the gun goes to his shoulder and the buckshot from the right barrel strikes the fawn stone dead at the very center of one of its flying leaps.

## CHAPTER III.—COURSING.

Deer coursing, or as it is commonly termed, "hounding," is unquestionably a sportsmanlike way of hunting deer when practiced in the proper manner, and numbers among its ardent devotees many of the truest and best sportsmen of our land. By "proper manner" I mean when deer are driven to watchers, who are posted on ridges or shallow streams; and since, in this form of the sport, the simple act of shooting the game affords the only chance for the hunter to display skill, he should make the most of the chance and use a rifle only.

A bright, crisp October morning, the rising sun crowning the mountain peaks and dissipating the light frosts of the night. Our party having partaken of a substantial breakfast and equipped themselves, are just taking the "field." To the south, beyond the river, rises a heavily timbered slope, which has for its background the peaks of a mountain range, the most prominent of which is distinguished by the simple, sun-applauding, "Old Hunter." Our plan of operations is now formed. A light breeze is blowing from the north, and as we are to watch the river, and know that deer when pursued by hounds run "against the wind," our guide is instructed to "put out" the dogs south of the river. Our hounds, four in number, are entitled to a brief description. There are the veterans Rover and Tramp, heroes of many a hotly-contested race, that show their ardor and impatience by tugging at their chains, and ever and anon giving forth a low, plaintive wailing cry, which is as music to the hunter's ear. Coloned and Sport, two youngsters just taking their first lessons, are so overjoyed at the prospect before them that they are working off their surplus energy by a series of antics and capers impossible to describe. A general movement of all hands is made, which develops into a hasty scramble on the part of the hunters, to reach their "stands." One goes to the "Meadows," another to the "Rapids," and another to "Sagehen Brook," the admiral goes to the "Point," and as he is directed to take the lucky one to-day, and is withal a sportsman kind and true, one who will furnish delightful companionship, the reader shall go with him.

Arrived at his destination, the first thing he does is to make himself comfortable. This is accomplished by clearing a space and fixing a seat at the foot of a large yellow birch. At his feet the river riples on its course eastward, gently bathing the sides of three small islands. Opposite him the river bank, rising abruptly, is covered by evergreen trees.

The sun floods the picturesque scene with a mellow radiance, and as all our hunter has to do is to watch and wait, he leans back against the birch, and gradually "the spirit of revelry" steals o'er him. While thus giving free rein to the fancies which crowd upon him, the noisy jay perches above his head and screams its surprise at its presence, the chattering red squirrel reconnoiters the position from stump and tree. The stately ruffed grouse struts coquetishly along the top of a log scarcely ten feet distant, and the crafty mink stares inquiringly up into his face from its hole in the bank.

But hark! from away up the rock-ribbed side of "Old Panther" comes the distance-mellowed voice of a hound, the magic sound which causes our hunters' hearts to beat like a trip hammer, sending the life-current coursing through his veins as though it were quicksilver. Involuntarily he grasps his repeater and springs to his feet. The joy screams a hasty farewell, the squirrel disappears among the branches of a neighboring hemlock, the grouse goes booming away, and the mink scuttles down into his hole all unheeded by him as he listens eagerly to the voice of the hound which soon indicates that the deer is standing at bay.

Spots and Sam, having reported to their guide the rifle breaks upon the air, followed immediately by the deep bay of another bound which proclaims the fact that a "Old Tramp the invincible" is rushing into the fray. Our hunter can scarcely repress his excitement as he listens to the furious onslaught of the staunch hounds, mingling with which comes the struggling cries of the dogs still held in check by the guide. The vociferous music of the chase soon narrows down to a lively duet, Colonel doing the tenor and Tramp the profundo basso, valley and mountain peak fairly ring-

ably stands the best chance of surviving the murderous rain of lead. At last the magazine of the Winchester is empty, and the fortunes of the day depend upon the single cartridge in the gun.

Hold on, stranger, don't shoot any more or you'll fill this lake with dead deer! The deer'll run ashore on land. Now wait till I get him by the tail; don't fire yet! Put the muzzle closer his ear; hold on; the gun bobs round so you'll miss him now. Stiddy there; now give it to 'em."

There, you've done it at last, and there is 175 lbs. of meat and a pair of antlers for you. The former we will take to your hotel, and you can point with pride to it while you brag of your exploit to your admiring friends. The latter will win you imperishable fame for you; for mounted over the door of your dining-room in your palatial city residence, they will be "voiceless witnesses" to unborn generations of your mighty achievement to-day. *Sic transit gloria mundi.*

I am conscious of the fact which has been noticed no doubt by the reader, that the scenes described in this article have had their commencement in the early morning. Well now I am going to treat you to a change.

It is night in the balmy month of June. No light from moon or stars penetrates the "blackness of darkness" which rests like a sable pall over the silent water of a wood-circled lake, and which is a fit companion for the dastardly deed about to be consummated upon its tranquil bosom by two individuals who are just pushing off from shore in a canoe. On the bow of the canoe stands the "jack," its powerful light reflected far ahead by a bright sheet of tin placed just back of it and which renders invisible the canoe and its occupants.

In the stern sits the guide silently and swiftly propelling the light craft by an almost imperceptible movement of the paddle. In the center sits the sportsman ("armed with—Heaven defend us—a shotgun—a double-barreled breech-loading shotgun. He is evidently determined to slake his thirst for revenge with gore. Last season he tried to shoot a deer ahead of the hounds, and although getting several fair shots, failed. Later he tried still hunting, and it is almost useless to add, failed again. But now—

"Keep still, oh ye heavens!"—the glory which *ignifatus* has just achieved, so many times, is about to be won. They have not proceeded far before the watchful guide discovers the gleaming orbs of a deer directly ahead and as they approach he is soon plainly revealed in the light of the "jack," breast deep in water, and looking wonderingly at the strange apparition approaching him. Nearer, and still nearer, comes the bewildering light, until its glare is scarcely a rod from the stupefied animal. Our "gore-seeker" at last grasps his opportunity, and with a spasmodic motion he seizes his gun, but in attempting to raise the barrels are discharged, luckily without injury to anything. There is a terrible snort and rushing through the water, and that deer, let us hope, is spared for a more glorious taking off. "Buck fever" is the only comment indulged in by the twin-turnd guide.

On they go skirting the shore of the lake, and four times within as many half hours is the silence broken by the hundred-throat of the "Old Taver" and distributor, each time sending a deer scampering out of the lake, and up the hillside, two of which are badly wounded. And now as they are passing a little cove, the splash—dip, splash—plash, of water plainly indicates some animal moving about among the water lilies with which the cove is thickly studded. A single sweep of the paddle heads the canoe toward the sound, and sure enough there stands a doe peacefully grazing. The "gore-seeker" is somewhat recovered from his attack of "fever," and as the deer stands broadside about twenty feet distant, he succeeds by a grand coup de maître in riddling the poor animal with just thirty-two large buckshot, and at last he is a hero. With what pride does he survey the victim of his deadly aim. "With what rapture does he exclaim, "At last I have killed a deer." The modesty of the fellow is astounding. Instead of killing one deer, he has slaughtered just five. Two of his victims are now struggling in the water, and death on yonder hillside, and soon carnivorous birds and beasts will be tearing the putrifying flesh from their bones. Two little helpless fawns will wait and bleat in vain for the mother he has so foully murdered, until they die of starvation, or become an easy prey to some rapacious animal. We insist that he shall have all the glory to which he is entitled. To secure one deer he has destroyed five.

The above is a truthful picture of "floating" for deer as practiced by the average summer tourist, and by which method more deer are destroyed than by all other methods combined.

Reader, if you are ever tempted to "float" for deer, I beg you will heed the advice I am about to give you. Take the money you would have to spend during your trip and with it buy a good fat cow, tie her to a tree, then choose your distance, anywhere from five to twenty feet will answer, then if you are not sure of your aim, rest your gun or screw it in a vice, and then—shoot her. Use a Gatling gun if you are anxious to see blood flow freely. By adopting this plan you will be entitled to fully as much credit for skill, be subjected to less discomfort, and secure more meat than you would, were you to "float" for deer. If you have unbounded confidence in your skill and desire to do something particularly brilliant, give the cover the gun of the bystander when you open your battery upon her, killed at the first fire under these conditions, the explicit will win more fame for you than you can ever secure behind the "jack."

I shall say but little about "watching at the ticks" and "crusting," for the reason that the former is not a very destructive method, and the latter, although at one time deer in certain sections were literally annihilated by it, is now nearly obsolete.

This happy state of affairs has been brought about by earnest effort on the part of sportsmen, aided latterly by the guides, who at last have been brought to see that "crusting" was "killing the goose that laid the golden egg," and who have done much by word and act to bring the reprehensible practice into disrepute.

In conclusion I would say, if this short article, on a subject about which so much might be written, shall lead deer-hunters to renounce obsolete methods, and pursue the sport in a sportsmanlike manner, its main object will have been accomplished.

## HOW TO HANG UP A DEER.

IN my rambles over the country I have often been struck with the number of quite experienced hunters who did not in the least understand how to hang up a full grown deer unassisted. I herewith send directions, so that any person of ordinary strength can hang up the largest buck.

After inserting a gambrel in the hind legs of the animal in the usual manner, cut a couple of crochets about eight feet long, then bend down a spring sapling and insert the top under the gambrel. Now place your crochets, butt end up, at right angles to the sapling, hook one of them into the sapling, just below the gambrel, and place its butt so it will not slide; now, with the top of the other crochets in your hand, lift up on the sapling, pressing it against the crochets

at the same time. When as high as you can get it, insert the other crochets above the gambrel. If the sapling is not strong enough to hold the weight of the deer, carry the foot of the crochets toward the place where the thing is done. If the deer is very large, or your muscular energy small, you can start with crochets three or four feet long and then use longer ones. A good hatchet is very essential; the double-edged hatchet of "Nessmuk's," a cut of which you published some time ago, was shown to me by my old friend, H. L. Leonard, then just from Pennsylvania, in 1853. I had one made in Bangor, and after using it for two years discarded it for a much better pattern, which Leonard himself originated, a diagram of which I inclose. One edge should be ground very thick for cutting bones.

PENOBSCOT.

## CHEESEQUAKE CREEK.

THERE is probably no locality in these United States, of which the whole country has heard more and knows less than Cheesequake Creek, in New Jersey. Standing, as it does, first on the list of the famous (?) River and Harbor appropriations, it has attracted universal attention and comment of a not over enviable nature. But though its name has come to be familiar in our mouths as household words, not two persons in a thousand have ever seen it, save in print or on the map.

Cheesequake Creek (a corruption of its Indian name *Ches-naguch*) has been so often made the subject of newspaper reports that a description of it at this late date would be as flat, stale and unprofitable as the snipe-described marsh and meadow, through which it winds. Its history is in nowise different from that of many other places, whose charms lie mainly in their rural retirement and secluded quiet, added to the natural beauty of their situation.

For a century and a half it has been a famous spot for hunting and gaming, and a great resort for followers of fur, fin and feather. But, alas! its glory has departed, and another must be added to the fast-increasing list of "have-beens." The waists of Bob White and Will Wilet are not heard now-a-days as often as the whistle of the locomotive; and railroad tracks have supplemented those of foxes, hares, minks, "coons and 'possums, which once were plentiful.

Time was when a dozen or more woodcock might reward a search along the meadow's edge, where now the noisy trains rush by, and from the porch of the "Old Tavern" you might plainly see the yellow-legs approach the blinds where unexpected death awaited them. At night the salt-holes were alive with black ducks, and by day the teal and spigotals dabbled in the creek. To be sure the "Old Tavern" still remains, a curious relic of antiquity which has outlived many storms and generations. But that is all dead. Everything has changed. As you step off the cars you would hardly know the place, with its prim station, iron drawbridge, and telegraph poles. Its very name is in danger of oblivion, and one is reminded of the Israelite who met a stranger whom he thought he recognized: "Vy, Moses, how you has changed! So help me, my tear boy, I would never haf known you!" "Excuse me, sir, but my name is not Moses." "Vat? Goot heffens! Your name changed? No? Yes, it is called Morgan now on the time-table, and thousands of travelers to and from the New Jersey seaside pass it daily unaware of its identity.

But let me not give the impression that "Cheesequakes" as a hunting ground, has passed wholly into history. Good bags may still be made there now and then. A storm will bring wild ducks into the creek quite often, and in August or September one may strike a very decent flight of bay-birds. Perch and striped bass are still fairly abundant in the creek, and crabs seen from as far as the coast. Moreover Charley Applegate, like Daniel Webster, "still lives," and as long as his conversation continues to be adorned with the wealth of expletive and simile which enriches his vocabulary, Cheesequakes will never lose its hold upon the interest and affection of the brotherhood. Never, never!

But aside from this attention, "The Creek," as we call it, enjoys another and much less known, but which neither time nor the time-table can rob it; it is the best place for bag shooting in the State, and may be in the whole country. Every spring, along in April, there will be three or four days during which a strong westerly wind, with bright, warm sunshine, will prevail. This is the kind of weather that the hawks love to migrate in, and on these days I am always on the spot before times, for the birds begin to arrive by seven o'clock, and the cream of the shooting is in the forenoon.

A glance at the map will show you that New Jersey lies directly in the path of the spring migration from the Middle Atlantic States. You will also see that it is cut nearly half way in two in the middle by Raritan Bay, which extends some fifteen miles westward from Sandy Hook, and varies from two to six miles in width. Now, hawks do not like to cross broad water, and when, having sagged off toward the coast by reason of the strong west wind, they reach the bay near Sandy Hook, they are obliged to cross it to Long Island or Staten Island they turn to the left and follow the south shore until they come to South Amboy at the head of the bay. This course carries them across Cheesequake Creek, near its mouth, just where the railroad and county bridges span it,

and at that spot, within a space of two hundred yards between the tavern and the bay shore, as many as 800 hawks of all sizes have been shot in one day.

A singular fact in connection with these migrating birds is their apparent boldness and indifference to danger. They seem to be oblivious of any weapons or snipers on land, and the sight of a man with a gun, running at top speed to intercept them, as is often done, seldom alarms them or causes them to change their course at all, a procedure which is so utterly foreign to their nature at other times as to seem very remarkable.

As for the propriety of this annual slaughter of the hawks, I presume it is open to question, there being much to be said on both sides. But concerning the sport itself there can hardly be two opinions among those who have enjoyed it. When there is a good flight on there may be five or six birds in sight and coming toward you at the same time. You can see them for half a mile or more, and there is no little excitement in the prospect. The shooters are strung out from ten to thirty miles apart, and when even a single hawk is coming there is always a delightful uncertainty as to who will get the shot. Sometimes half a dozen guns will be snared in succession at one place, and he who escapes unhurt after all, or come down only at the last discharge.

Of late years the hawk shooting at Cheesequakes has fallen off considerably, owing, we think, to the increase of those who are on the lookout for them along the coast, whereby many are killed before they reach the creek, or even the bay at Sandy Hook. But even now a strong west or northwest wind, if warm, will bring hawks, in varying numbers, all the month of April and often as late as May.

PENOBSCOT, N. J., April, 1883.

## SYRACUSE SHOOTING GROUNDS.

I TAKE much pleasure in adding to the general stock of good places two more, which I consider most excellent for bird shooting and shooting. The first, Otisco Lake, situated in the town of Otisco, Onondaga county, N. Y., distant from Syracuse twelve miles south; accessible by rail and stage; expense from Syracuse, one dollar. At the village of Amber, situated at the foot of this lake, will be found a first-rate country hotel, kept by one Samuel Boutwell, who would most cheerfully answer any correspondence and give such information as might be desired either as to spring or fall shooting. I have no hesitation in saying to the boys that this is a good place to hunt or shoot. Ducks and snipe are at the present time quite plenty. Shooting especially must be good there for the next two weeks. Hotel fare, one dollar per day.

The second place I would mention is Big Sandy Creek Pond, situated north from Syracuse forty-five miles. Here I am confident may be found the finest feeding ground for ducks and snipe in the State of New York. A marsh covers a thousand acres with a most luxuriant growth of wild rice, celery, etc., attracting large and numerous flocks of ducks and snipe, both spring and fall. A first-class sportsman's hotel is here, kept by Mr. George Wood, and at the moderate price of \$1.50 per day. Mr. Wood is himself a thorough sportsman, and a most excellent shot. Guides can be secured at very moderate rates, if desired; good boats, and plenty of them, to accommodate all on hand at all times, and free of charge. Should any of your readers see fit to give this place a trial they will find in Mr. Wood a competent and obliging man, and true to the interests of all who may give him a call.

The route from here, is via Northern Railroad to Perreton Manor, and from there eight miles by stage; railroad fare from here \$1.55, and stage fare \$1. By writing to Mr. Wood or telegraphing he will meet parties with his own team and transport them safely from the railroad station for the five cents. I refer you to Mr. Wood's table, from personal experience I announce it good. Mr. Wood telegraphs me that game is more plenty, especially ducks, skipe, and wild geese. These grounds are less than twenty-five rods from Lake Ontario, nothing intervenes save a high bank of sand washed up from the lake. The marsh is well sheltered and very beautiful to the eye of a sportsman. A fine place for sport shooting or decoying.

Mr. Wood's address is George N. Wood, Lake Erie Point, Woodville, Jefferson county, N. Y. Mr. Wood is at Amber, Onondaga county. Boutwell can be reached by mail; Wood either mail or telegraph. S. E. KINGSLEY.

## FREEDMAN AND QUAIL.

THE recent discussion in the columns of the FOREST AND STREAM relative to the destruction of the game by the freedmen has interested very much, and being situated in a country where both Samba and the quail flourish, feel qualified to express an opinion on the matter. I must say, in defense of the darkey, that I have never known of a dozen quail being killed by him with a gun, and I have never known of more than a few dozen having been trapped. In proof of the assertion that the negro is not a quail hunter (though he will shoot one if he sees it sitting perfectly still, and has his gun), I refer to the fact that I find on almost every out-hut, a "Bob White," the bulk of the coverts and the finest and fullest coverts, in the immediate vicinity of the darkey cabins. Since no birds have been taken from the coverts, it follows that the darkeys have not troubled them, and this with the full knowledge that the quail are there, for the negroes can at any time direct you to a covert or two within a few rods of their humble doors. Almost every darkey in Eastern North Carolina and Eastern Virginia thinks that he must plant a pea patch. The peas are a staple article of food for the family. Some are always left on the vines and become dry in the field. The quail is as fond of peas as is the freedman, and naturally seeks the pea patch, can there be found in all his glory, feeding at times up to the very door of the cabin.

On a recent hunt, not far from the village, in company with another gentleman, we found three full coverts in a little dry corner of a new ground, which had been "cut down" and the brush left on the ground for the family of negroes living in the cabin hard by. Now, so near were these fine coverts of birds to this cabin, that we had to withhold fire many times after scattering the birds, for the whole family of darkeys were about the door to see us shoot, and were in the line of fire. These birds, three fine coverts, had been reared within 100 yards of that cabin, in which a large family were living. The head of the family owned a gun, and was most anxious to have the quail, but he was afraid to hunt quail, because he didn't feel sure of killing on the wing, and didn't look for them on the ground. Nor is this any isolated instance. I can to-day, with my setter, find at

MAINE GAME LAW.—Dixfield, Me., April 7.—*Editor Forest and Stream.*—Another issue of March 29 a mis-take in the Maine Game Law, and in the issue of April 7, "New Maine Laws," you say close time from January 1 to September 1 for moose, deer and caribou. It should read January 1 to October 1. September is a close month.—HENRY O. STANLEY.

## SOME EXPIRED REEL PATENTS.

THE first patent ever granted by the United States for a fishing-reel was issued to John A. Bailey, of New Jersey, Aug. 5, 1856.

His invention consists in having the crank-shaft work laterally in a socket attached to the end plate of the reel, and having a bevel-wheel attached to the crank-shaft, acted upon by a spring, so that when not pressed inward by the person holding the reel, it will be kept out of gear with the reel.

In the cut (Fig. 1.) A represents the reel frame, of the usual form and construction. B is the reel pivotally fitted in the frame A. To one end of the axis or shaft, C, of the reel, a beveled pinion, D, is attached, and E is a spring which is attached to the end plate, *a*, of the frame. This spring has a circular aperture, *a*, made through it, so that it may yield without interfering with the pinion, D, the spring being a flat metal plate. An aperture, *b*, is also made through the outer part of the spring, and a pin, *c*, attached to the plate, *a*, passes through the aperture, *b*. The crank-shaft, F, is hollow and has a beveled wheel, G, on its inner end. The shaft is allowed to slide laterally in a collar, *d*, attached to the end plate, *e*, of the frame. The spring, E, bears against the bevel-wheel, G, and keeps it out of gear with the pinion, D. The pin, *c*, fits into the end of the shaft, F. H represents the operating crank.

By this arrangement the reel, B, when the crank-shaft, F, is not pressed inward, is free therefrom, and the line may consequently be thrown outward a greater distance than where the usual reels are employed, because there is no friction to overcome except that occasioned by the rotation of its own shaft or journals.

Before the date of this invention the reels generally used were permanently connected by gear wheels with the operating handle, and consequently the friction therefrom offered considerable resistance to the line as it was thrown out.

The next invention, granted Feb. 10, 1857, to Edward Deacon, was for effecting the same purpose as that above described.

Referring to the cut (Fig. II., *a*) A is the reel fitted within a frame formed of two plates, *a*, *a*, connected by rods, *b*. The frame has the usual box, B, one side to inclose the gearing, C, D. A sleeve, *E*, is placed on the crank-shaft, F, within a socket, *c*, on the outer side of the box, B. In the sleeve, *G*, a slot, *d*, is made, having side notches, *e*, *e*, as shown (in Fig. II., *b*). The pin, *f*, of the socket, *c*, fits in the slot, *d*.

The crank, H, is secured by a nut, *g*. The crank-shaft is shoved in or out, so that its wheel, D, may be in or out of gear with the pinion of the reel-shaft by merely shoving the sleeve inward or drawing it outward. The notches, *e*, *e*, serve to lock the wheel, D, in either position. Deacon avers that the pressure upon the crank in the Bailey reel, above mentioned, renders the winding up of the line a difficult operation, and that a person is liable to forget that pressure upon the crank is requisite in order to connect the crank with the reel-shaft. He says the spring also is liable to lose its elasticity, and the parts may thus be rendered inoperative. August 9, 1859, William Blincheson, of New York, devised a fishing reel so constructed that when the line is wound up it shall form a ring instead of a cylinder, thus providing efficiently for its drying without the necessity of unwinding the line and spreading it out, while at the same time the weight and cost of the reel are reduced.

From the plate, A (Fig. III., *a*), attached to the rod in the usual manner, projects the pin, P. The disk, D, rotates thereon and carries the divided rings, R R R (shown by the drawings, Figs. III., *a*, *b* and *c*). These rings form the skeleton of a tubular ring, in the inside of which the line is very easily coiled through the openings. To guide the line in its winding and unwinding, and prevent the escape of any loose coil, if such should exist, the opening formed by dividing the rings is filled, in all but a small portion of its extent, by means of the ring, *a*. This ring is kept from rotating by means of the braces, *e*, *f*, which are attached to the plate, A (seen in Fig. III., *b*). One of these braces is forked, and has attached a loop or guide through which the line passes.

Aside from the great reduction in weight and cost over a reel constructed in the ordinary manner, the general form is much more convenient for carriage in the pocket, as the whole thing, line and all, forms a flat disk of no very great dimensions; but the great advantage consists in the complete exposure of the line, whereby it is enabled to dry rapidly and thoroughly, and is prevented from decaying. In the common form, when the line on the reel becomes wet, either from complete submersion or from winding wet portions of the line over it, it is difficult for the central portions of the line to dry, covered, as they are, by the outer layers. In this reel there is but a small portion of the line covered, and the whole surface is fully exposed to the air. It would seem that the line can be wound with rapidity, thus dispensing with the complicated and expensive gearing for that purpose. The inventor asserts that one turn of the handle takes up more than seven inches of line.

The "Palmer reel" (1860) employs a traveling or reciprocating line-guide attached to the reel, and operating automatically in such a way as to cause the line as it is wound up to be adjusted evenly on the shaft of the reel. Figs. IV., *a* and *b*.

The reel, A, is of ordinary construction, *a* being the frame and *b* the box which contains the multiplying gear, *c*, *d*, through which the reel-shaft is rotated. The operation of *a*, *a*, is as follows: In order to wind up the line evenly on the reel, A, the upper end of the lever, *g*, is shoved upward and retained in that position by the nut, *m*, being screwed up against the outer side of the box, *b*. In this position of lever, *g*, the pinion, *j*, is in gear with the wheel, *e*, and as the crank, *e*, is rotated a rotary motion is communicated to the shaft, B, and which, through the medium of a half-nut attached to guide, B, gives a reciprocating movement to the line-guide, D, thereby moving the wheel, *g*, in, casting out the line—the upper end of lever, *g*, is shoved down the inner end of socket, *h*, thereby elevated, and the pinion, *j*, consequently thrown out of gear with the wheel, *e*. The line-guide, D, is forked at *o* for the passage of the line between.

The object of Dougherty's invention is to provide an efficient means for controlling the delivery of the line, so ar-

anged that it does not interfere with the winding-up mechanism, and so that also the angler may operate the device for controlling the delivery by the same hand which controls the rod.

The frame of this reel has two shallow heads (Fig. V.). A B, connected by crossbars, *a*, one of which forms the base by which the reel is connected to the fishing-rod, C. The spool, D, on which the line is wound, is of the usual form. One of these heads, A, contains the winding mechanism, consisting of a cog-pinion secured to the spool arbor, and a cog-wheel attached to a counter shaft which extends through the head, and is fitted with the hand-crank, E, for winding the line. The other head, B, of the frame contains the friction brake, consisting of a spring, *m*, partially encircling a smooth-rimmed wheel, F, secured to the arbor of the spool, D. One end of this spring brake is fastened to the reel-frame, and the other to the outer end of an arm, *n*, secured to one end of a brock-shaft, *d*. This brock-shaft extends from one head of the reel to the other, and is fitted at its center with an upright thumb-plate, G, so that the thumb-plate, rock-shaft, and arm, *n*, constitute a lever by means of which the spring, *m*, may be made to engage the wheel, F, to control the unwinding of the line. The device is so arranged that the angler can apply his thumb to the brake without removing his hand from the rod. This thumb-plate has a set-screw, *e*, so arranged as to vary and limit the distance to which the former can be moved, whereby the brake power and degree of strain upon the line can be adjusted to the strength of the line.

With a reel thus constructed the angler may hold the rod with his hand in such a position that the thumb of that hand can be applied to the thumb-plate of the controlling mechanism, so that he can control the running out of the line the instant he ceases to wind it up by the application of his other hand to the crank-handle.

F. B. BROCK.

WASHINGTON, D. C.

[TO BE CONTINUED.]

WEAKFISH COMING.—Phila., Pa.—The hard crab is showing himself in numbers; this is a sure sign of the near coming of the weakfish to the waters of Delaware Bay.—HOMO.

## THE ADIRONDACKS.

IN reading your editorial in last week's issue in relation to the trout fishing to commence on Long Island to-day, I could not help noticing, residing as I do on the northern borders of the Adirondacks, the great contrast that there is between the two localities in regard to the forwardness of the season. There, you say, the ice has been out of the streams for a month; while here the streams and ponds are no freer of ice than they were in January, and the snow in the woods is from four and a half to five feet deep. The thermometer here yesterday morning, April 1, stood only 6° above zero at 7 A. M. Sleighting has been good here up to within a day or two, and has been since December 1. The past winter has been the coldest for many years, and the month of March was the coldest and most stormy of any. The only signs of spring here yet are a robin or two that have made their appearance during the last week, and the crows, which have been back a week or two. They have always remained here all winter heretofore, but this winter was too much for them, and they left sometime near January 1 for a warmer clime. The English sparrows that for several winters previous to this have been here in large flocks in the streets and dooryards, have all disappeared this last winter. Whether they have gone south, where it is warmer, or have perished with the severe cold, I cannot say. As none have yet returned I think very likely that they all perished. In place of sparrows and crows we have a new kind of bird, which I never saw before this winter. It is a brown bird, somewhat smaller than a robin. They come in flocks of from ten to twenty. Some of them have a reddish head, which I take to be the cock bird. They do not seem to care for the cold, for they will sit on the trees in the dooryard and sing or whistle a plaintive note when the cold is below zero.

I do not hear that the ruffed grouse have been injured or have perished by the cold weather to any extent. The snow has been very deep in the woods all winter, and the ruffed grouse has a way of burrowing under it in cold weather, where they keep from the cold.

While there has been a great complaint of the scarcity of the ruffed grouse in most all other parts of the country for the last few years back, they have been very plenty here in

Franklin county, both in the Adirondacks and in the strips of forests that are scattered over the county. In the months of September and October you can hardly pass through a pack of woods of any low area without without securing a duck or two. I think the cause of their remaining so plenty here is that they are never scared. I have never known or heard of a partridge or ruffed grouse being scared in Franklin county, and I have been in most all parts of it where snares would be likely to be found. I wrote you some time ago that a lumber company was about purchasing a large portion of the Adirondack wilderness that is known as the St. Regis tract. It was then that I was about to construct a railroad from some point in the district to connect with the Ogdensburg & Lake Champlain road at Moira. They have purchased upward of 100,000 acres and have it surveyed, and have obtained a charter for the road, and have the timbers for building the bridges on the ground, and expect to have the road in running order by another fall. It is called the Northern Adirondack Railroad in their charter. For the present its southern terminus will be at a point on the Middle St. Regis known as the Five Mile Level, about three miles east of St. Regis Falls, where they are building a large mill for sawing their lumber. The past winter they have had three gangs of choppers cutting timber on the land. The land they have purchased comprises all of the territory about the headwaters of the three branches of the St. Regis River. It takes in all or all but very small lots of Townships No. 13, 14, 15, 16, 17 and the south half of No. 10 and 11. By taking a look at Stoddard's map of the Adirondacks, where the numbers of the townships are given, you can see what a large tract of territory this company has purchased. It extends to within a short distance of Mearns Lake and Paul Smith's, on the St. Regis Lake, on the east, and to St. Lawrence county on the west; and is, I claim, one of the best, if not the best, portion of the Adirondacks for deer and other game, as well as for trout fishing, that is now to be found in that region. As to the effect that the lumbering business will have on the hunting and fishing in that territory, my opinion is that for three or four years to come it will not be greatly injured by it. But a railroad running into the heart of a good hunting and fishing country will make it so easy of access that it will, I believe, in a few years, be so overrun by sportsmen and others that, as in all other places that are much frequented, the deer and trout will get scarce as the number of visitors increases.

The lumbering itself does not, I think, injure the hunting or fishing to my great extent: deer are always found plenty around clearings where the underbrush is left, and in the woods that are partially open, as those are that have been lumbered in. Trout fishing will continue good until the streams and ponds are overfished, or until saw mills are built on the headwaters of the streams and the dust from the mills kills off the trout, as is the case in many streams in the hills of the Adirondacks. As to the county for hunting or fishing I believe that at the present time there are but very few, if any, localities of near the same extent that will equal the tract of territory purchased by this company. Until within a year or two it has been but very little frequented by sportsmen residing outside of this or St. Lawrence counties. There are at present three hotels, or houses, within it that keep accommodated for sportsmen. One is at St. Regis Falls, and the other two are at the head of the tract. There is a post office, Daniel McNeil, proprietor. The other two are at Blue Mountain, eleven miles further south and near the center of the tract, and within a short distance of the Sixteen Mile Level of the Middle St. Regis, which runs through the center of the St. Regis district from south to north. One is called the Blue Mountain House, Henry Phelps, proprietor; the other the Forest House, McNeil & Co., proprietors. Post-office addresses are both St. Regis Falls.

ADRIEN O'NEAL.

MOIRA, N. Y., April 2, 1892.

## A TESTIMONIAL TO REUBEN WOOD.

BEFORE Mr. Wood sailed for the London Fisheries Exhibition, we were at the office of Forest and Stream. In the course of conversation we noticed a portion of a badge peeping from under the lapel of his coat, and inquiring about it, Reuben, with his characteristic modesty, replied: "It's only a little badge the boys gave me before leaving Syracuse." We found it a large and elegant one. From a scroll there are two bars dependent, to which a bundle of fishing rods is hung; a miniature reel is placed in the center, a twining fishing line below, and the whole is crossed by other rods. A large gold medal is enclosed by these, on which the portly figure of Uncle Reuben is engraved in the act of wading a stream. The likeness is good, and by the angle at which his ever present cigar is tilted, we see that he has just struck a four-pounder.

From the Syracuse *Sunday Times* we learn that the presentation was made in the presence of about thirty friends, and was accompanied by the following remarks by Mr. Deane Conits:

Mr. Wood—I have been requested by the members of the Onondaga Fishing Club and others of your friends in Syracuse, to say a few parting words before you leave us to attend the International Fisheries Exhibition. We wish to express to you our appreciation of your valuable services to the club, our admiration of your wonderful skill as an angler and your enthusiastic love of the sport—you never failing fond of good humor, good nature and good fellowship at all times, but most and best appreciated by your associates while in camp and following the trout stream—our personal regard which has grown stronger day by day through a long series of fondly remembered years—our gratification at your appointment on the duties of which you are about to enter, and our congratulations to you, and no less to those who have so kindly and so wisely selected you for a position for which you are so perfectly and admirably fitted.

They have elected me to address you for a few words on any reason, I presume, except that I have known you long and intimately, and have, if possible, of all your friends, the strongest attachment for you. I have witnessed a great many wonderful displays of your skill, both in the tournament and upon the stream. I have seen you take trout where there was "no fishing"—at least it was so placarded on a board nailed up here and there. I have seen you lure and hook two-pounders from the woods where I had supposed only the smallest fry could find room to lurk. I saw you take seven trout, weighing ten pounds, from a pond where you mistakenly supposed you had permission to angle, with such celerity that the wrathful proprietor discovered the capture of the last and smallest one only. Oh! how handsomely you did apologize for taking that one—forgetting all about the six other victims of your skill then swaying in

your capacious pockets. I saw you at the inlet of Ox-bow Lake—from one position and without a single miss—sit in the bow of a boat and take thirty-six beauties in less than a half an hour, each victim leaping to your fly at sixty feet cast and reeled in through fifty feet of fly rods. I do here and now publicly forgive you for the torture you then inflicted on me—compelled, as I was, to crouch in the stern of that boat for a mortal hour and a half, while you serenely smoked and fished.

But I may not dwell on these incidents of our piscatory life. I must pass to the business of this meeting. Your friends and mine are in honor of naming you as one of us. Our attachment for you is very strong. As we wish you a prosperous voyage, a delightful sojourn abroad, a faithful, successful and agreeable accomplishment of your share of the objects of the mission, and a safe return to us and to your home. And we hope you may, while in Her Majesty's dominions, have an opportunity to give an exhibition of your skill in fly-casting by killing a few of the trout and salmon in the foreign streams—using, perchance, some of the tackle which your skill has won as prizes in tournaments in your native land.

And now, "Reub Wood." I have to say to you, in behalf of these Syracuse friends, that they claim a property in you. We spare you for a time to "Uncle Sam" for this occasion, but we claim to have you back again. And we mean there shall be no mistake about it. We mean to secure your return to us as far as in our power, beyond all mistakes and against all odds. And so we are going to put our mark on you for now certain identification, should you at any time unfortunately get lost in the mazes of London, bewildered in its fogs, mingled with the smoke clouds of your own inevitable, everlasting cigar.

Please, then, except and wear this badge, "Reub," presented to you as a slight token of our great esteem and love. We mean by the gift to do you honor. We know you will do honor to the gift.

## OUR ANGLING PRESIDENT.

NO matter what the judgment of the future may be upon the administration of President Arthur, his fame as an angler is established for all time on the strength of that fifty-pound salmon. He is now in the city seeking his favorite recreation, and he will have the success with the black bass that he has had with the salmon, and capture the biggest one on record. The New York *Sun* has been interviewing Mr. Francis Endicott, the bright and genial president of the National Rod and Reel Association, who has fished with President Arthur on many occasions, before the latter fished so deeply in political streams. Mr. Endicott said:

"Gen. Arthur is a good salmon fisher and has the highest record of any man in this country. But it is not alone as a salmon fisher that he excels. He casts a salmon fly beautifully, he casts a trout fly superbly, and he casts a bass bait equal to anybody. Those three things require entirely different styles of casting, and excellence in either depends so greatly upon the temperament of the angler and his practice, that it is an exceedingly rare thing to find a person who is capable of doing all three very well. It is because Gen. Arthur does present that rare combination of capacities in so marked a degree that I unhesitatingly pronounce him not only the first magistrate, but the first angler in the land."

Mr. Endicott said this in a manner that implied his regard for the latter title as a prouder one than the former. Drifting into the grateful current of reminiscences, he continued:

"Some years ago, when Gen. Arthur was Collector of the Port, we went down together to the Munsell's Pond on Long Island, and while there received a kind invitation from that genial gentleman, Mr. William Floyd-Jones, to fish in Massapequa Lake, which is pronounced by Mr. Spencer F. Baird, United States Fish Commissioner, the finest preserve in this country. It has been made by damming a large brook, and that stream, before pouring into it, winds through five miles of woodland belonging to Mr. Floyd-Jones. The trout are wild, of fine size, and I suppose we caught a hundred of them that day. Of course, we can't take away the largest. The others we replaced in the water. The General cast a beautiful fly; yes, beautiful. He throws to such a distance and with so much precision that I think he is the finest amateur caster that I have ever seen. I took the trouble to measure one of the President's casts, and it was seventy-eight feet. He makes the regular overhead cast, not the Wye cast, that Priard uses. We had a strange old creature named Hugh Montgomery to row us on the pond, and, by the way, he is the only man I ever saw who could manage a boat with two men in it so as to give both an equally good chance to fish. I gave the General what is ordinarily deemed the best place in the boat, the stern, myself taking the bow, and as Hugh rowed us along the old bed of the stream, in the middle of the lake, two or three times I raised a fish and failed to hook him. But each time, Gen. Arthur, casting where I had raised the fish, hooked him. The inevitable result of my raising a fish was his taking it, and, of course, he got the laugh on me. I told him I had got tired of that. 'Never mind, Endicott,' said he, 'you have the spasm of raising them. I know nothing like the excitement an angler feels in raising a fish; seeing it come to his fly.'"

"As we were going down there on that occasion an incident occurred that was characteristic of the General. We were passing South street, and, as the James slip ferry, when our attention was called by a loud shouting, and, looking up, I saw a big, truculent-looking fellow, driving a pair of horses attached to a large truck, dashing furiously toward us, while he shouted for us to get out of his way. I did so, skipped across the street as quickly as I could, and turned to look back. There stood Gen. Arthur just where he was when the truckman's yells were first heard by us. The next moment the truckman had broken into a gallop, and he stood firm and placid, looking steadily between the horses' heads into the eyes of their driver, who was exerting his utmost strength to rein in the animals. When they had come to a full stop, the General calmly continued on his way, without a word to the driver, but when he reached my side he said to me: 'I'd give twenty-five dollars if I were not Collector of the Port for about five minutes. I have no doubt that the evening would have been a very pleasant one for the truckman if the General had not been Collector of the Port. Gen. Arthur is, I think, one of the coolest, most courageous, self-contained, and placid men that I know. I've seldom lost a fish, but when he does, even then he shows no excitement or disappointment.'"

"Yes, I have gone fishing with him very frequently, but the incidents of one trouting excursion are much like those of another. I have not been salmon fishing with him, but

have been told by those who have how beautifully he casts his fly and how adroitly he manages his fish, and have every reason to believe that he is quite as expert an angler for salmon as I know him to be for trout. He does not seem to care much for weak fishing; has some on it sometimes, but did not seem to take much interest in it. He is very fond, however, of taking the big bass that they get off West Island—out from Newport—and from the stands of the Squib-nocet Club on Martha's Vineyard. They catch bass there running all the way from 10 to 65 pounds weight, and that, you will readily understand, is a very different sort of fishing from trouting, yet President Arthur is equally at home in it.

"Yes, Commissioner French has been off fishing with Gen. Arthur, but French doesn't know much about angling. He means well, no doubt, but is too busy a man to give to the gentle sport that calm contemplation and practical experience and study that make the perfect angler. Really he would not be able to tell a trout from a shiner if you were to paint some spots on the shiner."

Police Commissioner French did not seem to have a consciousness of his real position as an angler when interviewed by a reporter on the subject, but he spoke of President Arthur's abilities as a fisherman in the tone of an authoritative expert. President Arthur, he said, is pre-eminently the best salmon fisher in this country. Others may rival him in catching bass and trout, but when they come to salmon, there he is greatest of all. Mr. French did not feel that he would be justified in narrating any reminiscences of his concerning the recreations of the President of the United States.

Mr. L. W. Winchester, president of the National Express Company and treasurer of the National Rod and Reel Association, said: "I have been salmon fishing with General Arthur, and he is unquestionably a very expert angler. He has taken the largest salmon ever caught with a fly in this country. It was three years ago, in one of the Canadian rivers, I forget which one, but not the famous Restigouche, I think. That salmon weighed fifty pounds after its arrival in New York. I don't know of any man who can throw a better fly or kill a salmon quicker or in better style than President Arthur can. He used to be a member, and is yet, I believe, of the Restigouche Salmon Club, of which I was formerly president. It is a pity that Mr. R. D. Dun is not around here, as he would be sure to have some reminiscences for they have gone together, camping out and fishing, for years, in many places, and he knows more about the subject than anybody else."

## NORTHERN MICHIGAN.

WHOEVER would have thought an angler, and such I took "Prairie Dog" to be, would take offense at my letter to "Prairie Dog"? It is because the FOREST AND STREAM allows the little doggies to bark, as well as the big ones, that I had my little say. I spoke of Michigan as I find it. Other folks' experience does not satisfy me, and as for going off to it, twice as far as my thoughts. I wanted "Prairie Dog" to try again, and again, and he will conclude after all Michigan is not so bad a place as his fancy paints it.

A few words in answer to his queries: We have tramped twenty miles for a string of trout many times. We have waded the feeders of the Boardman River for four or five miles, and then walked another miles to camp, and I was dark when we were stumbled out of the woods. Like "G. H. W.," we strike into the woods, miles away from the railroad and always find trout.

Did we ever fish in a country where mosquitoes and flying pests are unknown? Aye! I'm there! The first fly we ever cast was in a stream running through a grand old park where trout were trout, and not fingerlings; where three or four of them were all an angler ever cast into, and but "Prairie Dog" in all manner, give me the wild-wood streams of Pennsylvania, Michigan and Wisconsin. I care not for the mosquito's nibble; we are not dainty dandies afraid of sun- or copper-colored skins; we prefer to push into the forest primal to find the wild trout that lurks under the gnarled and knotted roots of the sunken trees.

"Prairie Dog," my best friends have blamed me because I have "given away" the location of some of our trout streams. The angler ever cast bait into, and now they put me "on honor" not to write to the "cursed papers," as they call them, telling them of a new stream we have found. I am growing conservative, as I find one stream after another depleted by dear old "Nessmuk's" "trout-bogs," as he so aptly describes them, and think the advice of my friends worth following when they say "let the hogs find their own streams."

In conclusion—"T. S." is not as bristly as you imagine, and would have been glad to have given you pointers of some good streams, but cannot promise freedom from "skeeters," we "grin and bear them."

W. D. T.

CHICAGO, April 6.

FALLISH OR BLACK BASS?—Nearly ten years ago the writer was one of a party of four who subscribed an amount sufficient to stock the mill pond at Swedesboro, known as Black's Pond, with black bass. Two of the party, not having ever seen a black bass, went to Hagerstown, Md., where the fish were to be delivered to them, and had them put upon the cars, expecting what they dimly saw swimming at the bottom of the cask to be black bass. They were sadly taken to Swedesboro, where they arrived late in the afternoon, and were at once taken to the millpond and deposited there. No sign of black bass has since been noticed in this body of water, which is well suited for the growth of this fish, but there has appeared within ten years thousands of chub, or fallfish, which had never been noticed before in Black's Pond, and which could not have found a way there unless they had been deposited. It may be that my two friends who were intrusted with the delivery of the "black bass" were deceived, and unknowingly brought chub, or fallfish, with them instead of the desired bass. We have heard that Black's Pond, at Swedesboro, N. J., has since been stocked by the State commission. It is a fine body of water, well suited to the black bass. May we ask if it has been stocked?—HOMO.

CONNECTICUT TROUT.—April 1 coming on Sunday, and the law being off trout, I noticed quite a number of what appeared to be canes carefully wrapped in paper, and a peculiarly formed bundle under the arm of several persons, and these persons seemed to have a very "off look." Trout fishing with ice in the stream is a pastime I cannot enjoy. A few alewives, or what are called here "wahoops," have made their appearance, and one poor loudly "wahooped" is reported as being caught near Saybrook.—PICK PLACK.

wide between the ears, which should be placed low down, almost on a line with the eyes. There should be nothing prominent about the skull. The stop should be well marked, and the muzzle should be wide from the eyes down. (This is

Rifle and Trap Shooting

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

RANGE AND GALLERY.

WHO SHALL BE CAPTAIN?—New York, April 7.—Editor Forest and Stream: Have the directors of the National Rifle Association appointed their captain for the coming year? It is time that something was done in this regard. The men who intend competing for prizes should know early in the season what colors they are to follow. Much depends on the confidence each man places in his captain. If he thinks his superior can shoot, and he only has to beat his rifle, but how to use it, even to the making of a bullseye at the 1,000 yds., with how much more eagerness will each member go into the fray. With a leader who knows "every inch of the way" to the black-book just five-eighths of a mile down the range, the whole team will go into the battle with the confidence of victory already won, but no man will be fit enough to shoot an international match, knowing his captain is an inferior marksman that he himself can "put to the blush," and that his commander is there only for a "figure-head." The men used somebody to follow if this team is desired to win a victory. Each member must feel that his captain can and will lend him a helping hand, even to the taking of his place in the contest, should occasion require it. A captain of this caliber may be hard to find, but will pay the N. R. A. to secure the individual. This match should be made a study, and the captain should have his entire time to devote to the business, and work for its success just the same as any business man works for the success of his fortune. Then will our boys go over with some chances of victory, but otherwise you will see as disastrous a defeat as was ever suffered by an American team.

BOSTON, April 7.—At the Walnut Hill Range to-day a new set of matches were opened, but under very unusual conditions. Those of the closing series. A drizzling rain prevailed throughout the day.

Approved are the best results of the following matches:

Creedmoor Practice Match.

W. C. Charles (mil)	5	5	5	5	4	5	4-46
C. E. Edwards	5	5	5	5	4	4	5-45
D. P. Holder	5	5	4	4	4	4	5-41

Creedmoor Prize Match.

J. Francis (mil)	5	5	5	5	5	5	4-46
W. C. Charles (mil)	5	5	4	4	5	5	4-45
C. E. Edwards	5	5	5	5	4	4	5-41

Decimal Match.

R. Abbott	8	10	6	9	10	6	5	6-20
W. Charles (mil)	8	10	6	9	10	6	5	9-20
D. P. Holder	8	10	9	5	8	7	8	5-20
R. Abbott	7	4	6	8	6	7	10	7-20

Record Match.

J. Francis	10	10	10	10	10	10	10	10-60
T. P. Fellers	10	10	8	9	10	10	10	9-61

Following are the prize winners in the different matches which closed on April 5:

Creedmoor Match.

	Score.	Allowance.	Total.
J. B. Fellows	193	6	199
C. E. Berry	174	2	176
C. E. Batey	167	0	167

MANMOUTH RIFLE GALLERY.—Boston, April 2, 1893.—The shooting at this gallery during the month of March for the amateur season has been carried on in the usual manner. The matches between Stetson, Little, Lyman and Wilson on the score are as follows:

J. Stetson	45	45	46	46-237
A. V. Little	44	44	44	44-232
T. Lyman	43	44	44	44-231
A. D. Wilson	43	43	43	43-219

With the following score: 43 41 47 47-231. Mr. C. A. Chaucer, who has the prize in the Amateur Rifle Match, No. 2, with the following score: 43 41 45 45-221. During the month of April the matches were three matches, as follows: 1st. Amateur badge match, open to anyone who has never made better than 31 out of a possible 320. 2d. Professional badge match, No. 2, open to anyone who has never made better than 23 out of a possible 250. 3d. Handicap, between Messrs. Stetson, Little, Lyman and Wilson. Mr. Stetson to shoot 5 rounds, Little 4 rounds, Lyman 3 rounds, and Wilson 2 rounds. 4th. Handicap, 5 rounds each, or a possible 250.—N. B. Harris.

WORCESTER, Mass., April 5.—To-day, Fast Day, occurred a special match at the Pine Grove Range, under the auspices of the Worcester Rifle Association. The day was not a pleasant one while the wind was from 8 to 4 o'clock. The following scores tell the story of the work done:

Creedmoor Match.

Frank Johnston	45	45	45-135	9-142
N. B. Harris	46	45	45-136	9-144
A. Williams	43	43	43-129	13-147
John H. Howell	41	43	44-128	14-152
Stetson Clark	42	43	43-128	14-152
A. R. Rice	43	43	43-129	13-145
M. Ferguson	39	42	40-121	12-135

Decimal Match.

A. R. Rice	78	80	72-231	9-232
John N. Moore, Jr.	74	77	77-228	9-231
C. A. Fuller	72	72	72-216	9-217
John H. Howell	67	62	68-187	13-213
Stetson Clark	68	66	68-202	9-211
C. A. Allen	68	66	68-202	9-211
Frank Johnston	59	54	54-177	12-201
H. T. Farrar	55	48	61-163	18-215
Dr. Ferguson	54	54	54-162	18-210

The match which was set down for to-day with the club at Wheelock, West Virginia, has been withdrawn. The spring series of matches are to begin next week.

WORCESTER, Mass., April 6.—There was an unusually large number present at Woodland Range to-day at the shoot under the auspices of the Woodland Gun Club. The following is the detail score of each match out of a possible 20:

II. W. Weber	19	C. E. Houghton	14
C. H. Bliss	19	G. H. Butts	13
A. M. Allen	17	J. H. Clark	13
F. H. Fuller	17	J. H. Lewis	13
C. A. Parker	16	Holmes	13
H. H. Brown	16	H. H. Brown	13
H. H. Garland	15	C. I. Macomber	12
A. G. Newcomb	15	G. McAlister	12

W. H. D. HEDGECOCK, Jr., secretary of the Worcester Rifle Association, was held on the 21st instant, and after the election of Gen. Grant as the president of the association, the question of the international match was taken up. The meeting adjourned until the 22nd.

Readied, That the competitions for the selection of the members of the teams of American National Guardsmen, who are to represent the United States in the international match, will be held at Woodland, in July next, be held at Creedmoor on Monday, May 14, 1893.

and the following Tuesday, Thursday and Friday, beginning at 10 A. M., daily.

That the conditions of the competition will be as previously announced; unless otherwise announced the team selected will report for practice at Creedmoor on June 15, and continue to practice as a team until about June 20.

Readied, That, as the limited time will not admit of experiments, competitors will be required to conform themselves to the use of the standard military rifle, and to use the standard military ammunition, and particularly that they should use ammunition furnished by the makers of the rifles that they use; also, that competitors should provide themselves with competitors with all the ammunition they will require for the practice.

Readied, That a Committee of Five, consisting of Gen. C. F. Rohrbach, Chairman, Capt. B. B. Rogers, Lieut. Col. J. H. Brown, and two others, appointed to have charge of the competitions and the selection of the team, including all arrangements up to its departure, with power to make such regulations as may be necessary.

Readied, That in view of the practical benefits that have already resulted, and will hereafter be obtained by the National Guard of the country, in improving the character of our American gun and raising the standard military marksmanship, and the military authorities of the several States are earnestly requested to use their influence to induce the members of the National Guard to compete for places upon the team. It is also requested that they are represented upon the first representative body of American soldiers that has ever existed Great Britain.

GARDNER, Mass., April 5.—At the last regular meeting of the Gardner Rifle Club at Hackmatack Range, the inch ring and Creedmoor target combined were used, 200 yards, off-hand. The following is the score:

	R. C.	R. C.	Totals.
G. F. Ellsworth	97	49	146
N. B. Rogers	92	45	137
A. Matthews	92	45	137
H. C. Knowlton	83	45	128
J. T. Walker	83	45	128
C. G. Goodale	70	43	113
C. C. Merritt	70	43	113
W. Williams	70	43	113
George Higgins	70	43	113

At the range to-day there was a good attendance, and it being Fast Day, the reading for the day was read, and the delegation of ladies. The same target was used, resulting as follows:

	R. C.	R. C.	Totals.
G. F. Ellsworth	97	49	146
H. C. Knowlton	92	45	137
B. Williams	80	40	120
N. B. Rogers	80	40	120
C. Merritt	70	43	113

At the annual meeting of the club, held this week, officers were elected as follows: President, George F. Ellsworth; Vice-President, Alvin Matthews; Secretary and Treasurer, Fred H. Knowlton; Executive Committee—J. N. Dodge and Sylvester Hildreth. The feasibility of a uniform target was discussed, and Messrs. George F. Ellsworth, George C. Rogers and G. R. Pratt were appointed to confer and consult with the other clubs and see if they could arrange a target which all would adopt. It was voted that they should arrange a target, which also included the four additional targets in the standard target. There could be a good supply at the spring and fall meetings, which it is proposed to hold, the first to be held this spring. It was also decided to offer prizes which would be an incentive to members to visit the range and compete for them. The club has the wherewithal to make one of the best ranges in the State, and with the help of the public, which the club is noted, there is no reason why the range should not be a popular resort for marksmen.

SOUTHBRIDGE, Mass., April 5.—Members of the Rod and Gun Club, and the reading for the day was read, and the delegation of ladies. The detail is as follows: Ellis, 39; and I. Howe, 20 and 3; Phillips, 19; Olds, 16; Marble, 16; Bradford, 13; Williams, 12; Metcalf, 11; Rogers, 10; Campbell, 10; Campbell, 10; Brown, 3.

CLINTON, Mass., April 5.—At the meeting of the Clinton Club to-day there were four strings of balls thrown. The men participating in one or more and the number broken were as follows:

	balls.	balls.	balls.	Total.
Barton	22	6	21	49
McKay	22	6	21	49
Hayes	19	4	20	43
Brewer	13	5	15	33
Larkin	13	5	20	38
Carr	—	—	18	60
Elson	—	—	8	10
Boyer	—	—	13	23

WASHINGTON, D. C., April 7.—The members of the Columbia Rifle Association began regular practice at the range near Leaning's State this afternoon. The day was a fine one, and the best of circumstances, but taking into consideration the changeable wind and intermittent cloudiness, they were remarkable. At 5 o'clock the match between Messrs. Stetson, Little, Lyman and Wilson on the score are as follows: 43 41 47 47-231. Mr. C. A. Chaucer, who has the prize in the Amateur Rifle Match, No. 2, with the following score: 43 41 45 45-221. During the month of April the matches were three matches, as follows: 1st. Amateur badge match, open to anyone who has never made better than 31 out of a possible 320. 2d. Professional badge match, No. 2, open to anyone who has never made better than 23 out of a possible 250. 3d. Handicap, between Messrs. Stetson, Little, Lyman and Wilson. Mr. Stetson to shoot 5 rounds, Little 4 rounds, Lyman 3 rounds, and Wilson 2 rounds. 4th. Handicap, 5 rounds each, or a possible 250.—N. B. Harris.

WASHINGTON, D. C., April 7.—The members of the Columbia Rifle Association began regular practice at the range near Leaning's State this afternoon. The day was a fine one, and the best of circumstances, but taking into consideration the changeable wind and intermittent cloudiness, they were remarkable. At 5 o'clock the match between Messrs. Stetson, Little, Lyman and Wilson on the score are as follows: 43 41 47 47-231. Mr. C. A. Chaucer, who has the prize in the Amateur Rifle Match, No. 2, with the following score: 43 41 45 45-221. During the month of April the matches were three matches, as follows: 1st. Amateur badge match, open to anyone who has never made better than 31 out of a possible 320. 2d. Professional badge match, No. 2, open to anyone who has never made better than 23 out of a possible 250. 3d. Handicap, between Messrs. Stetson, Little, Lyman and Wilson. Mr. Stetson to shoot 5 rounds, Little 4 rounds, Lyman 3 rounds, and Wilson 2 rounds. 4th. Handicap, 5 rounds each, or a possible 250.—N. B. Harris.

"Well, it's here," continued the old scientist. "Here," drawing a line across the figure on the sand, "is your waterline, and here,

planting the cane some four inches below the waterline. "Is your meta centre. Now, feel the cutter and see where it will go." A line parallel to the upper one dually intersected the waterline, and the old man with much satisfaction, said: "Now, you see, in the first instance your meta centre was lowered as you careened your vessel, and in the other it was raised, and you can't get it to a point in the cutter where she will capsize, and that's the difference. Now, you understand it, don't you?"

The reporter replied, doubtfully and politely, that he did. The conclusion FOREST AND STREAM draws is, that those who wish to run down the cutter form of model, should be allowed to go on with their tall talk and rabid nonsense, but steer clear of facts, such as the old scientist quoted has made plain to them; for they evidently know little of their meaning.

We think at the same time, if lives are lost by taking the flat-iron type of boat to sea, that such composers of trash as appeared in the *New York World*, should be held to answer for the impression made on the otherwise unguided minds of the many who are about to build for themselves sea-going boats.

## MEASUREMENT OF KEELS AND CENTER-BOARDS.

Editor Forest and Stream.

The difficulty of classing centerboards and keels in a club in which the former are not numerous enough to be formed into a class by themselves, has given rise to a discussion on the fairest means of measuring the keels. The rule of measurement adopted by the club in question, is somewhat crude, as it leaves deep metal keels untaxed, and tends to cut down freeboard, the yachts being built with it being also deep keeled, with very low freeboard, especially on the sides, where the depth is taken, and with decks arched from covering board to center. It is simply a three dimensions rule—length×breadth×depth, and the product divided by 150 to give racing tons. It is fairly, also, in giving depth a greater value than breadth or length, as may be seen from the following examples:

	Length L.W.L.	Breadth.	Depth.	Tons.
Mariquita, centerboard.....	30 6	5 6	2 1½	1 89-150
Mascot, centerboard.....	30 1	5 11	2 2½	1 141-150
Miranda, centerboard.....	32 7	11 1	2 0½	2 143-150
Lily, keel.....	33 2½	8	2 0	3 144-150
Veleaar, keel.....	30 4	7	3 0	3 79-150

The difference is most apparent in the case of Lily and Veleaar. Lily's 3ft. greater length and 1ft. greater beam, being actually made inferior to the 1ft. 3in. greater depth of Veleaar. Again, Miranda's 11.0 greater length, and 11ins. greater beam, count less than Veleaar's 1ft. 5½in. greater depth. She has about 3ft. of board. All the above, with the exception of Veleaar, which shows a high side, have very low freeboard.

It is now proposed that during the ensuing season centerboards should be kept down during a race, as all the boards being of iron, for the sake of giving weight low down when on a wind, as well as lateral resistance, the raising and lowering them is a violation of the rule, which strictly prohibits shifting ballast in any shape whatever. A recommendation is added to alter the rule of measurement to length on l.w.l.×extreme beam×mean draft, product divided by 150. This is a step toward the adoption of a length×sail area rule, which finds favor with many who have given it consideration. The present Y. R. A. rule is inadmissible for evident reasons: Mr. Dixon Kemp's rule, rejected by the Y. R. A. in favor of their present imperfect one, would be used best to the length×sail area, as under it the yachts named above are much more equitably measured, as may be seen by a comparison:

	L×B×B.	L×B×Depth.	Tons.	Tons.
Mariquita.....	1.300	1.50	1.39	
Mascot.....	1.08	1.00	1.76	
Miranda.....	3.19	2.96		
Lily.....	1.28	1.49		
Veleaar.....	2.37	2.53		
Kemp's rule measures them more fairly, I think.				Rozee-Croix.

HALLAS, N. S. S. I've quite agree with R.-C. Movable keels must be recognized as of a fixed quantity. The rule of measurement adopted by the Swanwick Y. C. of New York.

Length on L. W. L.×sail area. 4,000—tons. Taxing but slightly the stern or overhanging stern, and limiting all flying kites to a proportionate area of the lower sails, we are persuaded will yet be the prevailing rule of measurement. The Yacht Racing Association of England are gradually approaching the adoption of this rule, and will do so after floundering about a little longer trying to see how, what are termed sea-going, cruisers can be classified with real sea-going racing yachts.]

## AMERICAN STEAM YACHTS.

MESSERS. WILLIAM CRAMP & SON, of Philadelphia, have added another powerful steam yacht to our fast increasing number. The new yacht, named *Atlanta*, and owned by Mr. Jay Gould of New York City, forms but a resume of their usual sound and well-finished work. If the *Atlanta* in her appearance and rig, has a life imparted into her by the hands of our large steam yachts, it is not surprising that she will evidence a march in the right direction of our native talent in naval architecture. Our contemporary, the *Iron Age*, writing on the subject of our American steam yachts a few days since, says:

"Steam yachts in America during the past few years have been vastly increased in size and fitted with materially improved machinery. Speed has been the objective point in the construction of their ingenuity severely to that end. The *Stranger* and *Corsair*, of the New York Club, followed by other large vessels of similar type, marked the beginning of the improved steam yacht in this country. True, many boats underwriting the appellation of steam yacht were to be found on the lists of some yacht clubs for years before, but they were of indifferent account and only fit for inland waters. Specialists are now designing this type of pleasure craft, and are power, rig, and accommodations are being looked after with a nicety of detail which means that in the near future the fleet of American steam yachts may be pointed to with pride. The cruising steam yacht, containing all the conveniences of a home, and able to make a voyage of any reasonable length, with marked economy in the consumption of coal, is not now in the undeveloped state it was a few years ago, and the number of new boats of an improved type which will be seen during the coming season justifies the belief that the class of worthwhile steam toys have passed, and the fleetshape launches of a few years ago are being replaced by productions by naval architects of established reputation, fit for any service."

"The construction of yacht boilers of steel by American builders shows that the improvements made in this important particular in England have not passed unnoticed in this country. Again, though the hulls of our large steam yachts are iron, there is a considerable discussion in engineering circles regarding the use of steel for yacht building. The construction of steel yachts in Europe has demonstrated that the material is well adapted for the purpose, and is well understood. Many advantages are claimed for steel in its adaptation for plates and frames of yachts, and it is not unlikely that some wealthy sportsman in this country may think it best to build a steel steam yacht at no distant day."

BOSTON, April 6.—The annual meeting and election of officers for 1883-84 of the South Boston Y. C. was held on Wednesday evening, April 4, and in point of numbers was the largest ever held by the club. The officers elected were: President, John W. Morris; Vice-President, James Bennett; Secretary, John W. Morris; Treasurer, Thomas Christian; Secretary, John W. Morris; Wm. Morris. It is to be regretted that the Commodore-elect could not at the present time own a yacht. The annual reports showed the number of the club to be a flourishing one, with several new members were admitted and several others proposed. The club gave the last masquerade of the course on Thursday evening.—DEADWATER.

NEW CUTTERS.—Our Detroit correspondent writes us to say that Wendell is building a 20-footer, which is over a foot deeper than any yacht on their river of 2 feet draught. It is 20 feet long, 4 feet 2 in. 2 in., 4 ft. deep clear of the beams, and will draw over 3 ft. of water. She is to be ballasted with 2½ tons of boiler plate punchings, and will carry a large mainmast with a 100 ft. mast, and a 100 ft. water, with stay-sail and jib to match. Dean & Co. are also busy with another little cutter, which will be ready in about three weeks for trial.

## SMALL CUTTERS.

THE LEAD OF THE STAYS TO THE TOPMAST, ETC.

THE illustration showing the lead of the stays to the topmast, is extremely necessary for those made inquiry about the hoisting and securing of the topmast for small cutters. We illustrated our issue of March 22 the masthead of a ten-tonner, which shows the other (making three on each side) kept secure to an eyebolt in the illustration of this week shows the spread given to the topmast by the cross-tree, the head and pole of the topmast with the topmast stay leading to the bowsprit end, and the bowsprit end, and from thence on board the boat, will make the mode of securing the topmast of small cutters quite plain. If A is put in a line with A, B with B, etc.—all athwartship stays, and those which led aft when running before the wind, are called backstays. We have known but one of these backstays as being all that is required for small cutters.

There are many small cutters—especially those tested for speed with other boats—that are fitted with three backstays on each side, two of which are led athwartships (one lodged into an iron or wood cleat, or ram's horn, fixed to the after side of the cross-tree), and the other (making three on each side) kept secure to an eyebolt in the channel when not in use, but ready to be led aft to an eyebolt, about opposite the rudder head, when the boat is running before the wind. All these backstays, and the topmast stay (the one led through the block at the end of the bowsprit) are set up with tackles at their ends. The topmast stay tackle block being hooked to the windlass is bowsprit bits, the athwartship backstay tackle block is hooked to an eyebolt in the channel, and the running before the wind stay tackle block is hooked, as before noticed, to an eyebolt in the deck, about opposite to the rudder head. These two extra stays on each side are quite unnecessary for cruising boats, or boats that require all the space left below for the accommodation of the owner and his crew.

If cruising people at the same time wish to make the best speed possible when at sea, by setting a topsail during a hard blow, then it is quite necessary to have at least two backstays on each side, both of which can be used generally as athwartship stays, and when running before the wind, the one lodged in the cleat on the after part of the cross-tree, can be led aft to the eyebolt opposite to the rudder

post. The advantage of a boat being thus fitted with two backstays on either side is, that, scudding before a hard blow at sea, it is always best to haul down at least one reef in the mainsail, it gives better play to all the hullheads, and with reefs hauled down, it is sometimes happens that a jockey topsail can be carried. It is on such occasions, that a double athwartship backstay becomes useful, as, with the extra athwartship stay led aft, the jockey topsail may be kept on a boat when, to carry the whole mainsail, would be ruining the sail and chafing and straining all the blocks and ropes holding it in place.

In fitting the topmast rigging—the backstays and topmast stay are called the topmast rigging—some people make what is called a split splice, so that one depth of the rope only is round the pole of the topmast. We have witnessed several accidents when this mode is adopted, by the splice drawing slightly, when too much strain comes upon the seizing, or serving, around the splice. It is better for each shroud or stay to have a separate eye from the starboard shroud.

The above remarks about the eyes for the topmast rigging are also applicable to the main shrouds, and particularly so as applied to the pendant of the main runners. The practice of trusting to the main runners being secured, by being put in position before the main shrouds are placed, with the notion that the shrouds will nip them sufficiently when assisted by a seizing to the after shroud and to each other at the after part of the mast, is pander-ing too much to neatness, as the seizing soon gives way, and the pendants have been known to be fitted in this way. The pendants should be fitted with separate eyes, and put on to the masthead after the shrouds are in place, thereby giving more room for the horns of the gaff working round the mast than if put into position before the main shrouds are in place.

In a letter from Hon. Mrs. Penny Castle Grey, Limerick, Ireland, Brody's Haemorrhoid Troches are thus referred to:—"Having brody of your 'Bronchial Troches' with me when I came to reside here, I found that after 1 had given them away to those I considered required them, the poor people will walk for miles to get a few. For Coughs, Colds and Throat Diseases, they have no equal. Sold only in boxes. Price 25 cents.—Adv.

Can be obtained from any first-class gun dealer in the United States and Canada.

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, APRIL 19, 1883.

VOL. XX.—No. 12.  
Nos. 39 & 40 PARK ROW, NEW YORK.

## CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

## SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsmen throughout the United States and Canada. On sale by the American Exchange, 440 Strand, W. C. London, England. Subscription agents for Great Britain—Messrs. Samsom Low, Marston, Searle and Rivington, 188 Fleet street, London.

## ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

## THE PATENT COFFEE MILL.

THERE is a certain ingenious little contrivance sometime employed in grocery stores which is known to the initiated as the patent coffee mill. The machine is fastened to a partition of the wall, and into it is poured for grinding, the coffee just purchased by the customer. The clerk turns the crank and the buyer sees, or thinks he sees, his pure Old Government Java or Mocha coming out of the mill again. The product which he beholds is, however, only one-half or one-third pure coffee. The rest is browned beans, parched peas, burnt bread crumbs, or whatever else the economical merchant may have put into the concealed compartment of the mill, on the other side of the wall. The genius who devised this mill is said to have reaped a rich reward as the fruit of his ingenuity, and is reputed to be worth as much as the Connecticut quarry owner who ships his stone to manufacturers of granulated sugar.

Unfortunately the principle of the patent coffee mill is not confined to the humble cross-roads grocery. Its workings on a more magnificent scale may be studied at the respective capitals of the several States, when the wise heads there assembled come to the annual grinding of the game laws. That which ostensibly goes into the mill as pure and honest game protection is when ground out again only one-sixteenth protection and the rest destruction.

The mill under the big dome at Boston some years ago gave out such an adulterated product; and Boston markets have since then been receivers of what is equivalent to stolen goods, namely, Maine game illegally killed and shipped out of season. The process of grinding is now in active operation at Harrisburg, where the Philadelphia marketmen are attempting to open their stalls for the same ill-gotten merchandise. At Springfield, Ill., the crank has of late been vigorously turned by the Chicago game dealers, chief among them a professed sportsman game dealer, whom we recently showed knowingly to be a receiver of contraband goods in the form of Minnesota game illegally killed and shipped out of season. Neither at Albany do "the grinders cease because they are few" nor yet is "the sound of the grinding low." Quite the contrary; the grinders are many, and the grinding is loud.

Among the bills, amendatory of the present statute, introduced this year at Albany, is one known as the O'Connor bill. This provides for summer shooting and (by opening the game market) for winter shooting up to February first. In other words, the public is given to understand that the result of the passage of this bill will be game protection, whereas in truth it will be game destruction. Mr. O'Connor, we understand, does not occupy a position corresponding to the proprietor of the grocery store; he simply acts the part of the clerk, and turns the crank of the mill "by request." He doubtless means well enough. The public, however, will not consent to be duped by such a shoveling in of burnt crumbs from the other side of the wall as this is.

Another piece of legislation on the patent coffee mill principle bears the name of Mr. Grady. Whether he is the responsible party, or, like Mr. O'Connor, merely the clerk, we are at present uninformed. Neither position is an enviable one, for in this Grady bill, which was introduced into the Senate week before last, is embodied a heterogeneous combination of preposterous abominations. The responsibility for this would be a grievous burden to be borne by one pair of shoulders. The Grady bill, like the O'Connor bill, permits summer shooting, and by extending the selling season to February 1, insures the destruction of game in this State and at the West for two months after the legal killing season has expired.

But the bill goes much further than this in absurdity. It seeks to graft on to American game legislation the most obnoxious and ridiculous principle of private ownership of wild game. Section 20 permits the creation of private parks by advertising a description of the property, and provides that all the birds, fish and game of, in, or upon such territory shall be the private property of the owner or lessee of the premises, and further that to effect such a result but one signboard shall be necessary on every 500 acres in excess of 10,000. This section, in short, gives the right of appropriating all the game in a given part of land by proclamation only, and when it does this it affords proof positive of either the stupidity or the inordinate monopolistic greed of its framers. By its provisions individuals and clubs would be empowered to proclaim themselves proprietors of all the game on a given tract; and could let out the slaughter of it when and how their caprice might suggest.

If Mr. Grady knows anything whatever about the principles underlying game legislation—and having introduced a bill on the subject, he probably does know something of it—he must understand that the game, *feræ nature*, is public property until it shall have been reduced to possession by capture. And even an idiot might comprehend that signboard proclamation is not capture, nor can in any conceivable way reduce the game to the lawful possession of the parties erecting the board. The Senate committee who reported this bill, if they were at all competent to decide upon the merits of a proposed game law amendment, should have understood that this Section 20 of the Grady bill is just so much meaningless bosh. Even should it become a law, this section could not stand a minute when brought to the test of the courts. But we cannot believe that the bill will fail to be defeated, as it richly deserves to be.

The radical trouble with much of the attempted game legislation of the country is that those who dabble in it are, like the framers of the Grady bill, either so lamentably selfish or so blissfully ignorant that it would be far better for the public did they let the matter entirely alone. It is an unfortunate fact that ninety-nine men out of every one hundred in the community care little or nothing about the game law, and the hundredth man is apt to be imbued with the overpowering conviction that the first, last and only thing needful to protect the game is to amend the law so far as it concerns his own particular little duck pond. Schism all too often rules the day; game protection means the bringing of the game lawfully within reach of one special gun just when the owner of the gun wants it there.

The mills are grinding on; and the grinding is said, in a small way, to be profitable to some one.

HON. E. D. POTTER.—We rejoice to learn that the veteran angler and fishcultivist, Hon. Emory D. Potter, of Toledo, who has been lying at the point of death from pneumonia, is now convalescent. Mr. Potter's age is somewhat against him in a struggle with the reaper, but he has passed the turning point and is now out of immediate danger. His hosts of friends, both in and out of the Cuvier Club, will read this note with satisfaction. Mr. Potter is one of those men who should always be with us; we have too few of them.

## MATCH CHANCES AND DANGERS.

THE preparations thus far made by officials of the National Rifle Association bid fair to produce good results in the International match, provided only that they be well backed up by individual effort. And just here should be the answer to much of the very unreasoning criticism which has already begun to pour itself over the work in hand. The programme to be followed in getting together the team has been published, and under it there need be no fear on the part of any really capable competitor that he will not be taken in as a member of the team—should his merits entitle him to that honor. The committee entrusted with the making up of the American squad may fairly be trusted to use their best endeavors to select from the not over large field, such a dozen men as will leave no better man at home when the sailing day comes. There may be prejudices, but they can be fought down, and under the sharp eye of a vigilant press, it is pretty certain that the team, when made up, will be a really representative one in merit as in other qualifications.

The field of selection is a narrow one, and more's the pity. It is a disgrace that, out of nearly fifty States in the Union, about one-tenth of the number only should have anything worthy, the name of a National Guard out of which a choice can be made. This is one of the most significant lessons of the entire contest, and one which thus far has been so entirely overlooked. It does not appear that the defeat of last year has roused the executive of a single one of the States, so delinquent in this matter, into anything like a sense of its shame. Had the defeat been one more of men than of rifles, this fact would have been brought into bolder prominence; but, compared with the situation in Great Britain, that in America appears the more disgraceful. There every section of the kingdom is able to send forward men fit to compete for places on a representative team. Here a few dozen letters would reach about every available candidate. Still the battle is confined to the dozen before the butts, and so, with a well-drilled and thoroughly competent squad to send over, our directors need not fear the great army of very competent shots throughout Her Majesty's realm, but whose skill cannot avail the dozen chosen to meet the Americans. This makes the situation the more hopeful, and renders the outlook a more encouraging one.

One of the real stumbling blocks in the way of making up of an harmonious team is that of the captaincy. It is perhaps the most advisable way to permit the selection of the leader by the shooting men, not merely the sanctioning of a nomination made by a board of directors who are themselves non-shooting men. The captain should be a marksman, and he should be thoroughly aware of what every man under him is doing. A man with certain set notions as to rifle or ammunition is not fit for the post. Such a one soon becomes a nuisance and a hindrance by insisting upon the adoption of his pet hobbies. The idea that since there is some money to be spent, the directors should put their own man in the supreme control of the team, is not a valid reason for taking the power of choice out of the hands of the team. The amount at best is but trifling, and under proper rules this could be accounted for exactly without handicapping the efforts of the team by placing over it a man who may not command the confidence of the men who are to do the shooting. The captain can more readily war than make a victory.

The great point to be borne in mind is to put the shooting men in such a frame of mind, and consequently condition of body, as shall enable them to do their very best in the match. After having stood the heat and effort of the preliminary competitions for places on the team, it is fair to assume that, as individuals, the men are competent, and the effort of the captain is to be directed toward making the men a compact, single-willed whole, rather than a collection of disjointed, though, perhaps, earnest workers for victory.

This result is the more likely to come under the direction of a captain chosen by the men, than under the rule of an outsider, who comes as the mouthpiece and the agent of a set of managers. If there is to be such a manager, create a new office and let him be styled captain, if the title is a tickling one; but then let there be a shooting-master or something of that sort, who shall be a man able to help the men technically, while his interest is as great toward one as another and his entire allegiance to the team in its work before the targets. With such a directing spirit, success may be looked for; without him it may only be prayed for.

INDIAN FOLK-LORE.—We publish to-day a charming bit of Indian folk-lore from Hudson's Bay.

## CONCERNING SALT MACKEREL.

A MOST important problem has been submitted to us, and we have preferred to make it the subject of the following remarks to answering it in the usual way, on account of the labor we have expended in order to reach a correct understanding of it. The inquirer writes:

*Editor Forest and Stream:*

A question has been risen as to the proper mode of placing a salt mackerel in a pan of water so as to freshen it quickly, or, in other words, to extract the salt. Now, I maintain that the common-sense mode is to place it on its back or skin side, it having been split, while my opponent insists that it should be laid with the inside flat on the pan, and consequently skin uppermost. I do not apply to you as a cook, but as an authority on fish, and by solving this knotty question you will greatly oblige, etc.

Taking down "Macguffin's Principles of Comparative Physiology" we learned the sub-cutaneous areolar tissue with its papillae is peculiarly adapted to throwing off all saline excreta, and from this fact we temporarily adopted the theory that the proper way to place the mackerel in the pan was with the skin side up, in order that the *cutsis aeri* could perform its functions as in life. Further investigation showed, however, that the epidermis, with its inner layer of polyhedral cells and pigment granules is minutely fitted to absorb saline particles, and we then concluded that if the fish should throw off salt by one set of cells and absorb them by another set, there would be a sort of balance established whereby there would be no visible result when the skin side was placed uppermost.

It is possible that geographical influences might affect the freshening process. In the salt-laden air known to extend over a circle of a hundred miles about Syracuse, N. Y., all rules might be reversed, and a formula designed for that district would then be valuable to the rest of mankind. In this emergency we wrote to our friend Mr. Reuben Wood, of the city of salt, and asked him how mackerel and codfish were freshened there. He replied: "My Dear Sir—I never heard of such a thing in Syracuse. We always add more salt to all fish which are alleged to be salted by the fishermen of Gloucester, Mass." Here light dawned upon us. Either the Gloucester fishermen, from motives of economy, did not salt their fish sufficiently, or the saline air of Syracuse has developed an abnormal appetite in its inhabitants who crave vast quantities of salt; if it does not prove to be a fact that they are trying to force the fishermen of Gloucester to use more salt in order to sell them more. This triple-horned dilemma only complicated matters, and we despaired of a solution of the question by our appeal to Syracuse, where all solutions appeared to contain more or less salt.

One sleepless night, while we were struggling with this problem, we chanced to remember that the learned Trichinurus had referred to the freshening of salt mackerel in his history of Galeocerdo. But the work was rare, no copy being found in any of the public libraries of New York. The only volume of this ancient work that we knew of was in the possession of Mr. William Florence, the celebrated actor, who was not in town. That gentleman, however, kindly sent us the following from Vol. XCIX., which tells of the origin of an eight years' civil war among the Galeocerdoes. We quote: "This disastrous war had a singular origin. It had been the custom of the people to freshen their salt mackerel by laying them in a pan of water with the skin of the fish down, or next to the pan; but the present Emperor, Hypoblenatus, when a lad of ten years, was sent by his mother, who was frying some liver and bacon for his Majesty's breakfast, to bring a No. 2 Gloucester salt mackerel from the cellar and lay it in water to freshen for the family dinner. The prince brought the fish and laid it in the pan with the skin side up, whereupon his mother ordered him to reverse it, and in doing so a sharp bone ran in his thumb. The court physician was summoned, and, after extracting the bone, he told the Emperor that the proper way to avoid accidents of this kind in future would be to lay the mackerel with the skin side up, and then the bones would all be hidden. His Majesty immediately published an edict commanding all loyal citizens, under heavy penalties, to freshen their fish with the skins up. The people so resented this law that a civil war raged for eight years before it was quelled, and thousands of people were killed. The Emperor's party bore banners inscribed 'Skins Up,' and the rebels had on theirs the legend 'Skins Down,' but after the war was ended all the subjects of the Emperor agreed that in future they would freshen their fish with the skins up, and peace reigned in the land."

We do not regard the fact that the party of the Emperor was victorious as being conclusive that the principle of freshening the fish with the skin up was necessarily the correct one, and we hold that the question is not one to be settled *ad artem*, but rather by the application of chemical laws, if we can only find which laws influence the case in the greatest degree. The law of gravitation is cited by Josephus, in support of the decision of King Solomon, who says: "The King was doubtless correct in deciding that the skins of freshening mackerel should be uppermost, as then the salt is precipitated to the bottom of the vessel and not retained inside the skin." In our opinion the law of gravitation has little to do with the case, and we must look elsewhere for evidence.

In the celebrated reply of Webster to Hayne, in the United States Senate, we find an allusion to the subject. Webster proves that Hayne is "athirst," for some object

foreign to the subject of this article, but still "athirst." Hayne was a representative South Carolinian, and the inference was that a majority of the people of that State were also "thirsting" for the same thing. Following this train of thought we conclude that improperly freshened mackerel might be the cause; and in carefully reading the history of the Carolinas, we come upon the well-known and oft-quoted remark of the Governor of South Carolina to the Governor of North Carolina, and at once sit down to write to them to know in what position they freshened their *Scambers* that produced this thirst which made it appear so long between applications of the remedy, feeling sure that if it was "skin up" with them then "skin down" was the proper method in order to avoid the consequences which befell them, and which have passed into a proverb. Alas! those estimable men died generations ago, and the present Governors of those States do not eat mackerel in any form, and are not at all conversant with the merits of the case. Therefore we despair of a correct solution of this question, unless something bearing on the subject can be found in the Censola collection, which has not been "restored," until the skin of the mackerel cannot be distinguished from the flesh side. Like the lost Masonic word, the wisdom of future generations may discover it, but we despair of its present solution. What has become of "Bob, the sea-cook," who used to give us such lessons in practical matters? Perhaps he, or some other old salt, can help us to leap, saltatorially, as it were, to a correct answer to this salusignous question.

## The Sportsman Tourist.

## BERTHA'S EDUCATION.

STRAYING away like a wild bird into the forest gray.

Catching a glimpse of the distance Here and there on the way,

Nere I found the stillness, Singing my joyous song,

Parting the low, green branches, Tripping the path along.

Tried which could sing the sweetest, The little brown birds or I,

While they were trilling carols Out of the chestnuts high.

Loader we sang and louder, Under the open sky—

Whether the passers heard us, Cared neither bird nor I.

Clouds of the sweet bird roses Showered their snow on me,

Or, in the spring, fell white flakes From the June berry tree.

Brenny air-castes I know not—Hum of the eager bee,

Flutter of leaves unnumbered, Whispered my dreams to me.

Tonic of mountain breezes Strengthened my slender frame,

While from my hillside climbing Footsteps elastic came.

Voice did the brooklet give me, Wandering past my feet,

Hushed to a clear, low ripple Echo would not repeat.

Watching the pine unbending, Towering tulip tree,

Standing erect and graceful, Straight-mind unconscious me.

Stealing the rose sunbeam Out of the vibrant air,

Palming it in the shadows, Grew my brown face more fair.

If as you say, my eyes shine "They have but caught the light

From the rich splendor of sunbeams, Or from the Hyades bright.

Better than other lessons Learned on the mountain-side,

Knowledge of life and freedom, All that is strong and wide.

Best that a life beyond me, Lids where I cannot see,

And that the Great Life Giver Cares for His earth and me.

JOSEPHINE L. ROBERTS.

## INDIAN FOLK-LORE.

THE following stories have been collected during a residence of some years among Indians who have not yet come into contact with any whites with the exception of the servants of the Hudson's Bay Company, so that these legends may fairly be considered to be free from the taint of civilization and to represent Indian stories in their primitive state. It will be noticed that the greater part of them concern the animals common to the country, especially as to the origin of anything peculiar as to size or markings on them. Animals having the gift of speech seems general both to stories of this continent and to the East, witness various stories in the "Arabian Nights' Entertainments," where animals have this power. I have taken great care to make no additions to these tales but to leave them as they were told to me. Many of them have almost a familiar look, such as the Climbing Boy, which certainly has some likeness to Jack and the Beanstalk, and the story of the Mistisnoo to the Roe in Sindbad the Sailor.

## 1.—How the Beasts Became Subject to Man.

Two young squaws were walking about on a plain one evening, when a Star (Mars) came down and carried them off to his world. The Star said the girls, for security, in an eagle's nest, and went about some business of his own. After a while the girls saw a Wolverine passing beneath

the tree on which they were suspended, and besought him to take them down; and to encourage him they promised to marry him on the spot. He would have nothing to do with them, and passed by. A Lynx and a Bear came along, to whom they preferred the same request; but only to have their petition scorned also. There they sat weeping and wishing for release until presently a Wolf made his appearance, who proved to be softer hearted than the other three beasts, and took the squaws down, and was made the happy husband of both the young women. By and by the Wolf and his three wives went down to the earth, and after roaming about for some time the Wolf told his two wives to remain in a certain place he pointed out to them, while he should go hunting. No sooner had the Wolf gone out of sight than the squaws, who were already tired of his loving embraces, ran away and hid themselves. The Wolf returned and was very angry to find that his wives had deserted him, and after relieving his mind by smushing up a few stumps of trees, he left that part of the country.

The squaws now came out of their hiding place and walked along until they came to a river, when they saw many canoes paddled down stream by some of the beasts and birds, to each of whom they shouted, asking to be taken on board. No favorable answer came for a while, until the Waterhen was beguiled into taking them with him.

They paddled along until evening, when the Waterhen put ashore, remarking that the girls must be hungry, and he had better see about getting them some supper. He ordered the two squaws, who were now his wives, to make a long line of willow bark, and when they had twisted up a strong cord, he tied it to one of his legs and told his wives that he was now to dive into the river, and that they must pull in the line as soon as he was tight. The Waterhen accordingly dived, but his first attempt failed, as the girls were too eager to get out something to eat, and so hauled in the line too soon. The Waterhen reprimanded them sharply, and once more jumped into the river. This time his wives were more careful, and were rewarded by finding a heavier tid to the line after they had pulled up about a fathom of it; and so on along the line, at a distance of only one fathom apart, heavier after heavier to the end of the line, when there were three heavy loads and the Waterhen himself. After drying all the beavers' meat, they took canoe and went down the river, setting deer snares on the way, to visit some people who were encamped in that quarter. These were representatives, singly or in pairs, of all the most commonly known beasts and birds of the present day, and they were then living in tents around a large lake, into which the river flowed. No sooner had the Waterhen and his squaws rounded into the lake and come in sight of the wigwams there than the beasts all shouted, "Here comes Waterhen with wives." The Waterhen's grandmother was camped here, among the rest, and he took up his abode in her wigwam, and made immediate preparations for a feast. After all was ready, feasting and dancing went on all night.

The Waterhen was afraid that the two squaws would be too much noticed by the other young men, and so, to guard against temptation, the squaws were ordered to stay closely in the tent and on no account to go to the dance. The women soon tired of the tent and sneaked off to see what was going on, but took care not to be seen by the dancers. The Loon was so handsome that, although the Waterhen's wives did not manage to see him clearly in the distance, they saw enough to make them resolve to forsake their husbands and go with the Loon. Instead of gazing at the Loon's perfection, they went back to their tent to put into practice a plan which would at any rate insure one night or day of felicity to them. They broke down two poplar stumps, which were infested with ants, and each of the two squaws laid one stump where she ought to have been lying herself under her blanketed robe. When the Waterhen came in with his dancing, he looked around the tent and saw quite tired by dancing. He considered to be his wives lying asleep; what of course he considered to be his wives lying asleep; they had lain down outside of the back of the wigwam as soon as they heard him coming. So, yawning and telling his grandmother that he would not likely turn out until midday, he laid himself down between the two blanketed stumps and dozed off. His tricky wives turned in beside the Loon as soon as they saw how nicely they had succeeded in blinding the Waterhen.

Some of the people who were camped nearest to the Waterhen were astonished to hear him speaking loudly and harshly every now and again, and reproaching his wives for pinching him and keeping him from the sleep he needed so much. This pinching was caused by the ants, who had spread all over the tent, and were avenging the destruction of their dwelling place on the Waterhen's legs and wings. Soon the Waterhen's patience was exhausted, and, jumping up, he found out what was the matter. Going cautiously from tent to tent, looking for his squaws, he found them at length fast asleep, one on each side of the Loon. Taking care not to awaken them he returned to his wigwam, and rousing his grandmother asked her for the loan of her ice-chisel, which he proceeded to bring to a red heat in the fire. Then he took the hot chisel and crept along to the Loon's wigwam, where he found the poor Loon still asleep, lying on his back with his mouth wide open. The Waterhen rammed the red-hot iron down the Loon's throat. (The mark of the burn can still be seen on the Loon's tongue.) This killed him of course. The Waterhen made no row, but jumped into his canoe and visited the deer snares he had set on his way down the river.

Presently some one dropped into the Loon's wigwam and found its occupant dead. He awakened the girl, who had slept all through these proceedings, and then made it known to all the others, and inquiries were made as to who was the murderer. When the Waterhen returned from seeing his snares he was at once asked if he knew anything of the wicked deed. Without speaking he drew his knife and stabbed himself in the throat, upset his canoe and disappeared into the water. By this action the people knew that the Waterhen was guilty of the murder, and they got into their canoes to make sure of his death, resolving to kill him if he was not already dead. The Waterhen was certainly not dead, but had thought by a ruse to make the others believe he had killed himself. He had prepared a bladder and fastened it along his throat; and it was into this bladder that the knife had been plunged. The Waterhen, knowing that he was pursued, dived into the water, and so nimble did he dive and hide that his would-be captors could not find him although they pursued him until sundown, when one of the beasts, wiser than the others, suggested that they should dry the lake. To do this they used different sorts of fungi, and eventually did clear all the water out of the lake; and said to themselves that at daylight they would do for the Waterhen.

commonly found moulting, and then present a mottled black and white appearance of the lower parts. The spring moulting appears to include the plumage of the entire head, neck and body; the summer dress being chiefly formed by a new growth of feathers, instead of merely a change in coloration of the old plumage.

302. Foolish Guillemot, Long-billed Murre—*Uria troile* Aud.; *Loricaria troile* Ridg. 763, Cs. 874.—Not common. This is the "foolish" or "common" murre, or guillemot of authors, but it is not very common at any time on the coast of Maine, where it occurs, however, during the autumn, winter and early spring. There appears to be some confusion among writers concerning the two species of murre found on this coast. For the Atlantic Coast of the United States the term "common" is inappropriate to this species. The published descriptions of the two species are at best meagre, and as unsatisfactory to ordinary students as are the names applied. This species may readily be identified by the length of bill, which measures one and a quarter inches or more from tip to nostril. In full maturity the long-billed murre may be easily distinguished, but for immature winter specimens the bill forms the most characteristic feature for identification, as will be seen by the comparisons given in the notes of the next named species.

303. Brünnich's Guillemot, Short-billed Murre—*Uria brunnicapilla* Aud.; *Loricaria argus* Ridg. 764a; *Loricaria argus* 876.—Common off shore along the entire coast in winter, and sometime abundant. Usually arrives from the north late in the autumn or early in the winter, and returns in April. This species is the "Brünnich's," "large-billed," or "thick-billed" murre of writers, and may be distinguished from the preceding named species by its comparatively short bill, of one and an eighth inches or less in length from tip to nostril.

The reasons for these lines are written may thus identify, by measurement of the bill, any murre obtained on the Atlantic coast of North America without reference to technical ornithological descriptions of other specific characteristics.

But little has been published about our murre since the time of Audubon, who gave, in his Birds of America, some account of their habits as observed in summer at Labrador, as also full descriptions of these birds. But various discrepancies may be noted that suggest the possibility of notes concerning the two species having been mixed. Audubon mentions the long-billed species (*troile*) as "more or less abundant during winter on the coast of Massachusetts and Maine," and the short-billed species (*brunnicapilla*) as "occasionally procur'd in Maine." In fact the reverse is true.

But if an one inquires of our coast gunners or fishermen concerning the "large-billed" murre, and the "common" murre, he will be told just what Audubon has told us. The explanation is simple. In the published writings of ornithologists the name "large-billed" and "thick-billed" have hitherto been applied to the murre that has the smallest bill, and is common every winter on our coast, while the name "common" has been applied by the same authors to the species of murre that comparatively is not common on our coast at any time. Audubon's measurements are also confusing, and a reversal of the titles of species to which he applied them will be necessary to approximate them to my own notes, and I therefore quote the following from "Birds of America."

	<i>Uria troile</i> .	<i>Uria brunnicapilla</i> .
Length to end of tail.....	17.50 in.	18.50 in.
Length to end of claws.....	19.50 in.	20.50 in.
Extent of wing.....	19.50 in.	21 in.
Wing from flexure.....	7.50 in.	8 in.

These measurements indicate *U. brunnicapilla* as the largest of the two species, but this is not the fact. From my own notes I select for comparison the following measurements:

	Long-billed Murre. ( <i>troile</i> ).	Short-billed Murre. ( <i>brunnicapilla</i> ).
Length to end of tail.....	17.5 to 20 in.	19 to 17.1 in.

The measurements of wing and extent integrate, as do also the measurements of tail. The extent of wing of the species *troile* exceeds that of the species *brunnicapilla*. The weight of the latter in lean condition is from one and a quarter to two pounds each.

The following table of measurements taken from my own notes will afford a convenient comparison of the most important dimensions of these two species. All measurements are given in inches and decimal fractions thereof:

	Foolish Guillemot or Long-billed Murre.	Brünnich's Guillemot or Short-billed Murre.
Adult, April.		
Young, March.		
Winter.		
Tip to apparent angle of feathers.....	1.50	1.30
Tip to nostril.....	1.50	1.30
Depth at nostril.....	.58	.42
Width at nostril.....	.35	.27
Gonyx.....	.79	.70
Tarsus.....	1.54	1.46
Wing-Chord.....	8.25	7.30
Wing-along edge.....	7.7	7.0
Length to tip of tail about 29.....	17.5	17.

The references to "nostril" mean the anterior border of the nasal aperture. Wing measurements are made with a tape line from bend to tip over the edge, and not the chord of the curve. It will be observed that the most characteristic measurements of the two species are lengths of bills, and are almost the sole measurements that never intergrade. Each species may also be distinguished by the following general comparison of characteristics:

Long-billed Murre (*troile*)—Bill, tip to nostril, about three times its depth. Tip to angle of gonyx about two-thirds of tarsus. Tonia of upper mandible bare at base, dilated, yellowish.

Short-billed Murre (*brunnicapilla* or *argus*)—Bill, tip to nostril about twice its depth. Tip to angle of gonyx about one-half of tarsus. Tonia of upper mandible feathered at base.

#### ADDENDA.

Willow Ptarmigan or Grouse—*Lagopus albus* Aud., Ridg. 474, Cs. 563.—There appears to be no reliable evidence that this species ever existed in Maine. In "Birds of America," Mr. Audubon has stated that he "felt assured it exists in Maine, as well as in the northern districts bordering on the great lakes." And further states that "Theodore Lincoln, Esq., of Dennyssville, Maine, shot seven one day, and many miles from that village." In regard to these statements, Mr. Lincoln has informed me that he could not remember ever finding the ptarmigan in Maine, and that "probably Mr. Audubon referred to those shot further North."

Mr. Lincoln speaks of the Canada grouse (*Tetrao canadensis* Aud.) as "spotted grouse," and it is my belief that the

incident of the seven birds shot in one day near Dennyssville, Me., related by Mr. Audubon, was properly referable to the "spotted" or Canada grouse.

Mr. Manly Hardy, of Brewer, Me., writes me as follows: "Besides my own chances for observations in Maine, New Brunswick and Canada East, I have taken great pains to inquire of all my fur collectors and hunters about ptarmigan, but I can find no instance of its capture in the region of the Atlantic coast. An old hunter who resided for twenty years near Gaspe, has extensive dealings in the Restigouche and Metapedia region, and knows the whole of that country, assures me that this bird is never found south of the St. Lawrence River, below Quebec."

I have fished in summer through various parts of Maine and New Brunswick, and hunted on the "south shore" of the St. Lawrence River in winter, and all my own observations and inquiries have resulted in repeated failure to find any evidence of the existence of the ptarmigan south of the St. Lawrence River. This species (*L. albus*) is common resident on the island of Anticosti, in the Gulf of St. Lawrence, however, and abundant in Newfoundland.

Prairie Owl—*Syrnium cucularia* Aud.; *Spydoly cucularia* hypogaea Ridg. 408, Cs. 487.—In 1879 an owl of this species was left in Portland, Maine, for a taxidermist (Mr. Arthur Nelson, Jr.). No person ever called for the bird, which was also taken by Mr. Nelson, although it was wing-broken, and no further notice of this specimen can be learned. It may have been a straggler from the plains in the West, but more probably was brought East in a cage.

Trumpet Swan—*Cygnus buccinator* Aud., Cs. 688; *Olor buccinator* Ridg. 389.—Some years ago (prior to 1868) a swan was seen at Scarborough, Maine, during several consecutive days. The late Caleb G. Loring, Jr., to whom the common name (*C. americanus*) was well known, observed this bird repeatedly fly from the bay and circle about over the marsh high in the air, uttering cries which led Mr. Loring to believe the bird to be a trumpet swan.

Tufted Puffin—*Morion cirrhatus* Aud.; *Lunda cirrhata* Ridg. 745; *Fratercula cirrata* Cs. 856.—The following record of this species is given in "Birds of America" by Audubon: "The specimen from which I drew the figure of this singular-looking bird was procured at the mouth of the Kennebec River, in Maine. It was shot by a fisherman, gunner while standing on some floating ice in the winter of 1831-32. No other individual was seen." As fifty years have elapsed since this occurrence without a similar record for the coast, the species is only mentioned in this connection.

Great Auk—*Alca impennis* (Linn.) Ridg. 741, Cs. 878.—Although this species is now generally supposed to be utterly extinct, it undoubtedly once existed upon the coast of Maine. Bones found at various places in Maine have been referred to this species. (See the "American Naturalist," L., p. 578.)

[The notes already printed close the body of Mr. Smith's history of Maine birds, which has contained much that is of interest to our ornithological readers. The author has, however, expressed his intention of making some supplementary remarks, which will appear next week. The value to ornithologists of such lists, when they are carefully and judiciously compiled, is very great, and we feel sure that the present one has been highly appreciated by those interested in the subject with which it deals.]

#### MASSACHUSETTS WINTER NOTES.

Birds wintering at Taunton, Mass., and vicinity during the winter of 1882-3.

BY JOHN C. CARROLL.

THE following brief notes of the past winter, and of the birds at Taunton and vicinity, I take from my notebook:

December, 1882, came in with snow on the ground, and during the month there were sixteen days of sleighing. The lowest point reached by the mercury was the 4th, 5° above zero. During the month of January, the lowest point was on eight days, twelve days perfectly fair. The month, as a whole, averaged 10° colder than December, 1881.

A few robins (*Turdus migratorius*), and bluebirds (*Sialia sialis*) were seen and heard at various times during the month. Saw golden-crested kinglets (*Regulus satrapa*) in company with chickadees (*Parus atricapillus*) every few days. A number of brown creepers (*Certhia familiaris*) remained here during the month. Yellow-rumped warblers (*Dendroica coronata*) were quite abundant; found them in swampy land near a river. Saw flocks of goldfinches (*Carduelis tristis*) from time to time, and song sparrows (*Melospiza fasciata*) remained with us throughout the month. Snowbirds (*Junco hyemalis*) and tree sparrows (*Spizella monticola*) were quite common; crows (*Corvus frugilegus*) common; blue jays (*Cyanocitta cristata*) very common, saw them every day. I went out. A small number of hairy and downy woodpeckers (*Picus villosus* and *P. pubescens*) were seen during the month. Golden-winged woodpeckers (*Colaptes auratus*) were quite plentiful. Great horned owls (*Bubo virginianus*) were seen several times. Several barred owls (*Strix nebulosa*) were seen. One of them was observed in a small swamp near the city. On the 24th a handsome adult saw-whet owl (*Nyctala acadica*) was brought to me that was shot at this place.

This is the first to my knowledge that has been taken here in the winter. Several years ago I saw a red-tailed hawk (*Buteo borealis*), and a number of rufous grouse (*Bonasa umbellus*), and quails (*Ortyx virginiana*) were seen at all appearance, wintering well, enough being left, when the season closed, to breed next spring and summer.

January followed December without any great change in the temperature. Ten days of sleighing. The lowest point reached by the mercury was on the 13th, 10° below zero; the highest on the 21st and 30th, 50°. During the month it snowed on nine days and rain fell on seven. The average was 33° colder than January, 1882. The morning of the 13th had the honor of showing up as the coldest of the season. Mercury dropped all night, and at 7 A. M. it reached its lowest point, 10° below zero. At 12 M. the mercury had climbed up to 40° above zero. A change of 50° in five hours is a little peculiarity of New England. The snow storm, which reached us on the night of the 9th, proved to be the most severe of the season. The wind blew hard from the north, and large drifts

were piled up, and travel to some extent delayed. At noon the mercury had not risen beyond 11° above zero, and the few people that had to be out encountered a first-class blizzard.

Bluebirds (*Sialia sialis*) were heard singing at various times, and a pair of them were seen in a meadow once during the month. Golden-crested kinglets (*Regulus satrapa*) and chickadees (*Parus atricapillus*) were common, and on the 23d I shot quite a number of the former, nearly all of them being adults. On the 24 I shot one of a pair of yellow-rumped warblers (*Dendroica coronata*), the only ones I saw during the month. Although I did not see any pine grosbeaks (*Pinicola enucleator*), several flocks were seen, and a few were taken. Saw a large flock of redpoll linnet (*Ergaticus linaria*) once during the month. Goldfinches (*Carduelis tristis*) were seen often in large and small flocks. A pair of song sparrows (*Melospiza fasciata*) was found by me wintering in a little sheltered valley. Snowbirds (*Junco hyemalis*) were common. Tree sparrows (*Spizella monticola*) were abundant from the beginning to the end of the month. Crows (*Corvus frugilegus*) were seen occasionally, but were not as common as in December. Blue jays (*Cyanocitta cristata*) were common. Hairy and downy woodpeckers (*Picus villosus* and *P. pubescens*) were noticed at different times, the hairy being more common than the downy woodpecker. Golden-winged woodpeckers (*Colaptes auratus*) were quite plentiful, a flock of them wintering in an old barn, where I saw them flying in and out of some holes near the top. Great horned owls (*Bubo virginianus*) were seen a few times, and on the 4th, a handsome adult was brought to me. A barred owl (*Strix nebulosa*) was seen once. A hawk was seen a number of times, which from the description must have been a red-tailed hawk (*Buteo borealis*). Saw ruffed grouse (*Bonasa umbellus*) quite a number of times, and found quails (*Ortyx virginiana*) from time to time in an old corn field feeding on the weeds and corn that had been left there.

February has been remarkable as a month of ice and snow. Nearly every snowstorm turned into rain, which froze, making one successive sheet of ice. There was excellent sleighing nearly all of the month. The mercury fell during the month to 6° above zero. During the month it has snowed eleven days and rained on nine days; eleven days perfectly fair.

A flock of robins (*Turdus migratorius*) and bluebirds (*Sialia sialis*) were found in the early part of the month wintering in a pine swamp on the outskirts of the city. Golden-crested kinglets (*Regulus satrapa*) were seen quite often. Chickadees (*Parus atricapillus*) very common. I saw brown creepers (*Certhia familiaris*) a few times. On the 5th I shot a yellow-rumped warbler (*Dendroica coronata*), the only one that I saw during the month. I saw a flock of pine grosbeaks (*Pinicola enucleator*) once. They were on some willow trees near a river. Redpoll linnet (*Ergaticus linaria*) became common about the 15th, and during the month I secured some good specimens. Goldfinches (*Carduelis tristis*) were abundant. A few song sparrows (*Melospiza fasciata*) began to appear on the 27th and 28th. Snowbirds (*Junco hyemalis*) were seen every few days. As to the sparrows (*Spizella monticola*) were particularly abundant. Crows (*Corvus frugilegus*) were more common than in January. Blue jays (*Cyanocitta cristata*) were plentiful all the month. Golden-winged woodpeckers (*Colaptes auratus*) were seen occasionally. Hairy woodpeckers (*Picus villosus*) were seen now and then, and I shot several from the trees in my back yard. Saw downy woodpecker (*Picus pubescens*) once. A few screech owls (*Scops asio*) began to show themselves. The latter part of the month I saw ruffed grouse (*Bonasa umbellus*), and quails (*Ortyx virginiana*) often, and from what I have seen they have wintered well.

The first two days of March were warm and springlike, but this soon gave way to very cold and blustering weather, which, with the exception of a few days, remained so throughout the month. We had some of our coldest weather in March, the temperature falling to 10° below zero in the morning of the 8th, and 6° below on the 9th. We had a few snow storms in March, the most that fell at one time was three inches.

A flock of goldfinches (*Carduelis tristis*), redpoll linnet (*Ergaticus linaria*), and pine linnet (*Chrysomitris pinus*) remained near our house nearly the whole of the month. A screech owl (*Scops asio*) was brought to me on the 1st. The morning of the 2d was warm and pleasant. When I awoke in the morning I heard song sparrows (*Melospiza fasciata*) singing, and soon after breakfast a flock of six robins (*Turdus migratorius*) alighted on a tree near the house. During the day a few bluebirds (*Sialia sialis*) made their appearance. The first bird to arrive from the South was a fox sparrow (*Passerella iliaca*), which I saw on the 4th. On the 10th I secured two snow larks (*Eremophila alpestris*) out of a flock flying on a field. March. I saw a cooper's hawk (*Accipiter cooperii*) and a small flock of yellow-rumped warblers (*Dendroica coronata*). I saw a chipping sparrow (*Spizella monticola*) on the 13th. I observed on the 16th a flock of ten male redwing blackbirds (*Agelaius phoeniceus*), and a flock of wild geese (*Branta canadensis*) was seen flying over. While walking near a springhole on the 19th I flushed a large woodcock (*Philohela minor*) out of some low bushes near by. A flock of purple grackles (*Quiscalus purpureus*) was seen on the 24th. A pair of pine grosbeaks (*Pinicola enucleator*) stopped here on the 25th. I saw a single white-bellied swallow (*Iridoprocne bicolor*), and shot a mockingbird (*Mimus polyglottus*) on the 26th. On the 28th I shot a cowbird (*Molothrus ater*).

Although I did not see a single shrike (*Lanius borealis*) during the winter, yet the local paper contained an account of the thinning out of the English sparrow, caused by this bird being introduced. On the 2d of March I found a pine linnet (*Chrysomitris pinus*) in the crotch of a bush with its head and neck eaten off. I have no doubt but that it was done by a butcher bird, as it was near the house and I had not seen any hawk about. I find the birds that have wintered at Taunton and vicinity are:

Robin (*Turdus migratorius*).  
Bluebird (*Sialia sialis*).  
Golden-crested kinglet (*Regulus satrapa*).  
Chickadee (*Parus atricapillus*).  
Brown creeper (*Certhia familiaris*).  
Yellow-rumped warbler (*Dendroica coronata*).  
Great northern shrike (*Lanius borealis*).  
Pine grosbeak (*Pinicola enucleator*).  
Redpoll linnet (*Ergaticus linaria*).  
American goldfinch (*Carduelis tristis*).  
Pine linnet (*Chrysomitris pinus*).  
Song sparrow (*Melospiza fasciata*).  
Black snowbird (*Junco hyemalis*).

Tree sparrow (*Spizella monticola*).  
Common crow (*Corvus brachyrhynchos*).  
Blue jay (*Cyanocitta cristata*).  
Hairy woodpecker (*Picus villosus*).  
Downy woodpecker (*P. pubescens*).  
Golden-winged woodpecker (*Colaptes auratus*).  
Great horned owl (*Bubo virginianus*).  
Screech owl (*Scops asio*).  
Barred owl (*Nyctale nebulosa*).  
Saw-whet owl (*Strix occidentalis*).  
Red-tailed hawk (*Buteo borealis*).  
Ruffed grouse (*Bonasa umbellata*).  
Quail (*Ortyx virginiana*).

### THE SOCIETY OF TAXIDERMISTS.

THE third annual exhibition of the National Society of Taxidermists, which opens in Lyric Hall, 723 Sixth avenue, on May 1, to continue five days, will be of great interest to all lovers of birds and beasts. Sportsmen will be especially interested in the groups of game birds, medallions and panels, and above all, the groups of painters and setters "at work." Mr. Hornaday's striking group of an English setter and covey of quail, entitled, "Coming to the Point," which attracted so much admiring attention at the Boston exhibition, and later in the National Museum at Washington, will be well represented, and there are several other fine "bird dogs" entered to compete against it.

The first exhibition of the society was held in Rochester in 1880, and the second a year later in Boston. Both were very highly praised by the press of their respective cities, and visited by admiring crowds. The display in this city will be larger than both the former one together, and the variety of objects will also be much greater. The objects of the society are to develop and improve the art of taxidermy until it shall rival those of painting and sculpture, and also acquaint the public with taxidermy as a fine art. Once a year the members meet to hold a competitive exhibition to compare work and exchange ideas. Those who know affirm that a vast improvement is already noticeable in the work of the members. The society contains over seventy active members and stands high in the estimation of artists, scientific men and sportsmen.

A very interesting feature of the coming exhibition will be a taxidermist's workroom, complete in all its appointments, with the taxidermist himself at work.

The opening reception will be held on the evening of April 30, to which admission will be by invitation only, but from May 1 to 5 the display will be open to the public, and it will be several years before another will be held here.

### SOME SOUTHERN CALIFORNIA BIRDS.

THE mocking-bird (*Mimus polyglottus* Linn.) of this vicinity is a bird somewhat larger than the Eastern bird, having a tail much more graduated, and differing somewhat in color. Its habits are similar to those of the Eastern mocking-bird, and it is very fond of staying around houses if unmolested. They remain here all the year, but are not so plentiful in winter as in the summer. They are generally found in the vicinity of thickets of brush or cactus, and seem to prefer valley life. The fruit of the cactus furnishes them the major part of their food. The nest is generally built in a thick bush or cactus not far from the ground, and is composed of twigs, leaves and grass, and is lined with hair when this can be obtained, and root fibres. The eggs are four to six, pale green, with blotches of brown scattered over them, mostly at the large end. This bird is unequalled as a singer, and its melodious powers are very great. While singing it will often leap from the bush into the air and then descend to the ground, and then rise again into the air, imitating all the while numerous birds and some animals. The mocking-bird is 10½ inches in length, and 14 inches in alar extent, wings, 4½ and tail 5½. Its color above is ashy brown, the center of the feathers being slightly darkened, the under parts are white with a faint brownish tinge, and the tail is tipped with ash above the breast. The wings and tail on the upper side are black. The bill and legs are black.

The sickle-billed thrush, which is a very good singer, is a much larger bird than the mocking-bird and does not imitate near so many birds, but many of its notes are much sweeter than those of the mocking-bird. The sickle-bill, however, lacks the life that the mocking-bird has. The mocking-bird during nesting season sings very frequently at night; it usually sings near the nest during the day. In winter it is very shy.

The shyest bird that we have here, especially during nesting season, is the California cactus wren (*Campylorhynchus brunneicapillus* Laf.). The male I have never been able to see during the nesting season, and the female only twice. The male is a very peevish little bird, and seems always to be quarreling. This species usually builds as high up as it can get on the branch of a cactus. The nest is large, from nine to twelve inches in length and four to six inches wide. Most of them have thick walls, but in some the walls are so thin that the thorns pass through them. The habits resemble those of most wrens, and it subsists chiefly on insects, but eats some berries. It passes much of the time on the ground.

The most common little bird that we have here is the house wren (*Troglodytes aedon* Wilson), known also by the names grass wren, house wren and sky lark. During the nesting season in May and June the male rises into the air, sometime out of sight, in a zig-zag circle, singing a sweet and varied song. The voice will gradually die away, and then as the bird commences to descend will gradually grow louder; the bird alights in nearly the same place that it started from. The nest is made in a small depression of the ground under a bunch of grass or a small bush, composed of fine twigs and grass. The eggs are a pale white, with darker spots sprinkled over them; they number four to six. In the fall they gather in large flocks. Their food consists of small berries and insects. I have seen one on a tree or bush.

The most brightly-colored bird that is found here is the western oriole (*Icterus bullocki*, Sw.). The upper part of the head and neck is shiny black, and a black line runs from the base of the bill down onto the throat, the under parts are a bright orange yellow, and a broad band on the wings is white. They arrive here about the first of March and resort to the orchards, where they eat considerable fruit, but pay for that by destroying insects and singing their sweet melody. Their nest is very pretty, usually built in a tall tree and out at the end of a branch. It is composed of rags, straw, horsehair, twine and wool. If horsehair or twine can be procured they are sure to use a liberal quantity and make it very strong. It is built in the form of a purse

and is suspended near the forks of a branch. The eggs, numbering from four to eight, are a bluish white, with winding streaks of black around the larger end.

Another very common bird is the Cassin's flycatcher or Cassin's kingbird (*Tyrannus vociferans* Sw.). This is a bird worthy of examination. The head and neck above and on the side is rather dark bluish-ash; but if we stop and examine the top of the head more closely, we find, by ruffling the feathers, a spot of brilliant yellowish red. The bird has the power to throw open these colored feathers, and when open the crest looks almost like a small flower, and during the day you will see this sly creature sitting on a post near beehives with its head down, as if asleep; but when a bee comes to light on this flower the bird is not asleep, for it gives a sudden snap and almost invariably captures a bee. The rest of the upper parts are olive green, tinged with gray; the upper tail coverts nearly black, and under part, in general, bright sulphur yellow; the bill is black and the feet grayish. During the winter of 1881-2, many of the birds of this species in this bird might serve as an alarm clock for those who desire to rise at daylight. It generally sings from the tree top, its notes being much more musical and louder than those of the other flycatchers. This nest of this species is very firmly built, being 5.00x2.50 inches externally and 3.25 across the cavity. The eggs are white, with large scattered umber blotches, thickest at the larger end. This bird is destructive to all insects.

JAMES E. WADHAM,  
Vice-President San Diego Historical Society.

FOOD OF THE WATER MOCCASIN.—New York, April 9. —While floating down the Oklawaha River, in Florida, one day during the winter of 1881-2, hunting water turtles, I noticed numbers of moccasins lying on the logs and branches of trees lining the shores and overhanging the water. When approached they had an ugly habit of lying very still until our boat was almost directly under them, when, with a great commotion and a splash into the water (uncomfortably close to us), they would disappear—the first notice we had of our proximity to them. After a while, being on the lookout, I secured three or four of their glossy brown skins, with the assistance of my choko boy, generally taking their heads off, being at close quarters. One, however, not having been badly hit, soon showed signs of returning life by moving around and cutting up antics, in anything but a pleasing manner, in the bow of the boat, which caused much uneasiness on the part of my sable attendant, who assured me repeatedly while dodging around and jumping from seat to seat in the boat: "Dey's pisin, suah, boss! fo de Lord dey's pisin, suah. However, we soon gave him the quietus with an oar. 'Twas then I noticed that this particular snake's case demanded an unusual share of my attention, as his "breadth of beam" was something astonishing. I resolved to investigate his "bread basket," and upon returning to the landing did so, when I found it contained a black bass (trout, South) of about ten ounces weight, intact. Whether his snakeship took the fish alive or whether he found him dead, floating on the surface of the river, I am unable to say, though I incline to the latter belief. The bass was larger in circumference by about two inches than the snake (when removed from its stomach) and nearly a third as long.—BLACK PRINCE.

COLORADO BIRD ARRIVALS.—Pueblo, Col., April 7, 1883. —Editor *Forest and Stream*.—The spring is unusually early here. I incline to the Eastern belief. The bass was yesterday—the first I have observed in Colorado. It was in company with Arctic bluebirds, *S. arctica*. The latter species was first seen March 7. Saw first killdeer plover March 27. Crimson-fronted finches and red-winged black-birds have been common all winter. A great blue heron and a sandhill crane were shot last week at the "lake" on the mesa. The magpies have built their nests, but have laid no eggs yet. Have seen no meadow larks (*S. neglecta*) yet this spring. They were occasionally winter here, as I shot one Jan. 3, 1878, during very cold weather, and when the ground was covered with snow. They were first observed last year, Feb. 6.—H. W. N.

### Camp Fire Flickerings.

"That reminds me."

JOHN is a rival of Andy's in the competition of catching the biggest bass. Several years ago Andy caught a three-pounder, and J-h-n grew correspondingly green with envy, and stated in his cigars that he would beat him before the season was over.

One day John, Andy and Jake were hard at it on the banks of the beautiful Swatara, when John observed a big bass jump from the water some distance from shore. Several times the fish emerged, and then John resolved to go for him. Taking a boat he rowed out and threw a live bait for the bass. He wouldn't strike, but continued to flop in a similar fashion, and John cautiously rowed up to him, placed both hands under him, and, as he lay on the boat not only a seventeen-inch bass but also a ten-inch catfish.

John was exultant, and at once claimed that Andy's insignificant three-pounder was cast into the shade by this double haul. On examination, however, it was discovered that the bass in endeavoring to swallow the catfish had been perforated as to his head by the spines of the catfish, one of which protruded through his right eye. Andy and Jake at once claimed a four-inch holding, and John had taken a base advantage of the bass by approaching him on the blind side, and refused to allow the cigars, though the double catch may have slightly exceeded in weight Andy's bass. However, John's claim was for length, and the case is still in statu quo.

Here's another: Joe McC. was fishing at the above place with a live frog for bait. For more than an hour he waited in vain for a bite. Pulling up to examine his bait he found the live leech to the shore, when to his utter surprise and pleasure (?) he found Mr. Frog seated calmly on a rock by his side enjoying his *stomach dip*. Joe declares that the batrachian winked at him with the most consummate impudence.

Some time I'll give you my snapper story. JUVENIS.  
LEBANON, Pa.

While out West I heard the following version of the famous crow and turkey story. My friend said: I was South a few years ago, and two of my friends, named Charlie and Henry —, brothers, went out cooning with a darkey. I saw the darkey afterward and asked him what

success he had had, and he said: "Yer see, Mars Henry said we'se 'go in cahoot.' Well, we got fo' coons." "How did you divide 'em?" "Well, Mars Henry he takes two, and Mars Charlie he takes two, an —" "What did you get?" "Well, I don't know," scratching his head; then brightening up, "I reckons I gets the 'cahoot.'" —OSIOIAO.

Nick Barco, of Crystal River, Florida, well known throughout Hernando and Levy counties of that State as a genial fellow, tells this one of himself. One afternoon, taking his double-barrel on his shoulder, he started through a piece of pine woods surrounding a small hamak to look for a yoke of oxen, and as he turned the point of the hamak, he saw a deer, two deer, two deer, and a deer, and he fired off through the pines not twenty yards in front of him. He stopped and watched them, saying to himself, "What a shot; if I had my gun I could get them both." As they disappeared over the ridge, he remembered that he had his gun on his shoulder, and then ran after them; but too late, of course.

### Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

### MY LAST DEER HUNT IN OHIO.

BY D. W. C.

IN a few years there will be no more stories to tell of the capture of this noble game in the Middle States. Here and there, in the inaccessible swamps and mountains a few scattering deer may yet linger, but most of them have fled before the ax of civilization, or have fallen at the crack of the hunter's rifle.

Forty-seven years ago, in company with Oliver H. Perry, a cunning hunter and a generous friend, occurred "My First Deer Hunt in Ohio," an account of which was published in FOREST AND STREAM. Then, in Ohio, Pennsylvania, New York, Illinois, Indiana and Michigan the "woods were full of them," and the sport of the still-hunter unbounded, but now, except in the North Woods of New York, and in the wilds of Michigan, the "sport" has become excessive labor and their capture a lucky scratch.

As an evidence and a record of what has been, for the entire history of my life, to read in the FOREST AND STREAM and fire his heart or compose him to slumber, I will recount, in truthful language, my last deer hunt in Ohio, twenty years after my first:

A light snow was falling on one Friday in the latter part of December, 1856, when meeting an old hunter he said:

"There are two or three deer in Parma, near Lake Abram, and if I were not for a confounded lawsuit my official duties oblige me to try to-morrow, I would go for them. This snow will make good tracks of his own invention."

"Can't you adjourn your case, or get a substitute to try it, and go along with me? If we start early and strike a trail while they are feeding in the morning and undisturbed, we may see them first and get one."

But nothing I could urge seemed to swerve him from what he conceived to be his duty to the State as prosecuting attorney, deeply as he seemed to regret the chance to try his own case, and revolving the matter in his mind.

Parma township, in Cuyahoga county, and Lake Abram are about twelve miles from the city of Cleveland, and at that time the Columbus Railroad was running a construction train through the west part of the town, and within two or three miles of the lake, starting at the foot of Superior street at 3 o'clock A. M.

Having got my traps together, or ready for a start at the drop of the hat, I concluded to take the 5 o'clock construction train and get off at Everett's Mills, where there is many a slip between the cup and the lip. When I got down there I could see, in the thick gloom, the tail end of the construction train crossing the Cuyahoga bridge. There was nothing left but to go back home or go afoot. It was about seven miles to Everett's Mills, the snow moist and the tracking splendid; by smart walking on the track of the railroad I could turn into the woods a little after daylight—certainly before sunrise.

Away I went at a lively pace, and with a little running where the ties were gravelled I was able to turn to the left into the thick woods northwest of Lake Abram when it was just light enough to see a track. Scarcely had I penetrated the thick undergrowth along the margin of an old "slashing," when I struck the trail of a deer whose tracks, meandering and close together and leading from bush to bush, indicated, as every old hunter knows, that the deer was feeding and unalarmed. Here was my chance, if properly taken, to steal along cautiously and still, peering into every thicket, every old tree-top, among every jumble of old logs, see him before he could see me, and get one shot before starting. Should I fail in this, a long chase before I could tire him out would be inevitable. When the trailing is good, and the deer started early in the morning, a good traveler can run a deer down so as to keep him in sight and get within shooting distance by four o'clock, provided no rest is given him, and you run when he runs, and only walk when he walks.

Following this plan of approach, I stealthily crawled along, crouching behind logs and bushes, keeping behind trees, and looking sharply everywhere.

Presently, in the top of a beech tree which had been felled when the leaves were on and the main body carried away for wood, I saw a slip of motion. Instantly, but so slowly that no movement could be detected, I lifted out and crawled to a tree for better and more deliberate observation. Bringing the tree-top in view again, I could plainly see the horns of a deer and the outlines of his body, but the distance, about twenty rods or one hundred yards, and the thick leaves and intervening trees and bushes, prevented me from seeing just where to hit him fatally. To get nearer appeared next to impossible; nothing remained but to shoot at what I could see, and wait for luck. I lifted the cover and take the chance of his going out the other side and be hidden from my sight. I waited awhile and began to tremble with the "back fever." That decided it. My rifle was slowly run along the side of the tree, my teeth set and my nerves braced up to repel the tendency to shake, and sighting at what was visible the sharp crack of my rifle resounded through the forest. I was not much surprised to

see him scamper off, for there was no certainty as to what part I had aimed, but I was rejoiced to see his leaps short and erratic and his tail down.

Hastily reloading, I lost no time in trailing him up on a brisk Indianlope. Soon I came to where he had lain down, and discovered by the bleeding in his bed that I had hit him in the upper part of his right hip. There was plenty of blood along the trail as I moved rapidly on, but I could not get a glimpse of the buck, so warily did he watch his back track from every knoll and cover. I must run him down. Girding up my loins, the question, not of speed but endurance, began in earnest.

It was but little after sunrise when the race began, and although unremittently kept up, I did not get sight of that deer until after three o'clock. I chased him over to the east branch of the river, then northeast toward the southerly end of Lake Abram; thence over to the Columbus road nearly; then northwest to near the place where I started him; thence again up the southwest side of the lake and down on the other side, until near the road, where the track showed the deer was walking and steering toward a large patch of recently felled timber, called a "chopping." There was a high ridge of fence between the chopping and the clearing. Now is my time to close the race. He will lie down in that chopping, and if I leave the track and come up on the leeward side of him he cannot escape.

Leaving the track, I made a circuit to the left, and was about to turn into the slashing when I heard a dog barking furiously and evidently coming toward me. I guessed the cause instantly, and my heart sank to zero. I feared he would chase my deer out of his chopping, and so, as it was getting late, the trail would be lost and the deer, too, in the darkness. I stood still and watched what would be the upshot of this new complication, when I saw two deer, one about fifty yards ahead of the other, running at great speed, and a large black dog about one hundred yards from the hindmost deer, coming diagonally toward me. Kneeling down I brought my rifle on a level, with a view of taking one of the other as they ran by, having chosen a clear open space along the foot of a dry wash which they must cross at nearly right angles. I soon saw that the hindmost deer was coming much nearer to me, so I let the foremost one pass and waited until I sighted on a level with his body and the tip of his nose and fired. He braced his forefeet out and stopped instantly. The dog came up while I was reloading, and the buck wheeled around and stamped at him. I walked along a few steps to get a tree, when the dog saw me, curled his coil between his legs and ran back out of sight. Believing the deer had left the deer fat, I held my gun on him and walked slowly toward where he stood, putting and apparently troubled for breath. When within about four rods, thinking, as he stood up boldly a perfect picture of strength and beauty, that he might run, I aimed at his head and was just pressing the trigger when the noble fellow sunk on his knees and rolled over on his side stone dead. The race was up, and I was the victor. I wanted to sit down and look at him for an hour, but there was no time to be lost; he must be dragged to the road before dark, and it was then four o'clock.

In removing the entrails to lighten the dragging weight, I discovered that he was the same deer I had wounded in the morning, my first shot hitting him edwise through the upper part of the right hip, and disabling but not breaking the bone; my second had struck through about half an inch of the lower part of the right hind femur.

I dragged him to the road, and luckily, within twenty rods of what was then called the "Stone Tavern," about twelve miles from Cleveland. While watching and waiting for a chance to ride to the city, I ate a hearty supper, and arranged with a Dutchman, who was going to town to market, to deliver my buck at my house the next morning.

After smoking my pipe and no time going toward the city appearing, I shouldered my gun and trudged along, hoping to be able to catch a ride. But no—all were going the other way. I had already walked and run over fifty miles since I left my home in the morning before five o'clock, so you may easily guess that the twelve miles before me looked long and wearisome. Well, it was two o'clock at night before my head was on my pillow in my own home. The deer came the next morning before I was up, the venison was duly divided, and amid thanks and congratulations, my hardest and last deer hunt was ended.

CLEVELAND, O., April 1883.

## MINNESOTA GAME NOTES.

NOTWITHSTANDING the unusual length and severity of the winter, small game seems to have suffered very little. No crust has formed on the snow to imprison the ruffed grouse, and the dozen or so that I have seen within the past week looked as plump and healthy as though they had passed the winter in Florida. This immediate locality, being largely timbered, has never produced a large crop of pinnated grouse, but several large coveys are now in the neighborhood, and they, too, look to be in excellent condition. "Bob White" has never, to my knowledge, taken up a claim in this county. Deer are unusually scarce, and must have fared hard and slept cold during the past four months. Occasionally I come across a trail in my rambles, and last week a fine large buck came out and looked our little village over; but unless the killing of deer is prohibited for a term of years, the glory of that sport has largely departed from Minnesota. Ducks and geese are beginning to arrive, and doubtless the supply will soon equal the demand. Grouse and black-crowned night-herons are found in abundance, and in prime condition for the table. I have had some rare sport with them frosty mornings this spring.

Wildcats are sufficiently numerous to cause sad havoc in poultry yards and among young lambs. I think at least a dozen of the bob-tailed nuisances have been killed in town this winter.

Occasionally wolves treat us to one of their infernal concerts, but rarely do the detestable brutes meet their just deserts.

One of my neighbors went out for a coon hunt last week, and, without gun or dog, captured five.

I recently had a bloodless encounter with a huge panther, the only one seen in this locality for years.

I understand that arrangements are being made to provide for the pleasure of the residents of the city and gun who may desire to visit our beautiful lakes. Certainly no more healthful or promising fish and game locality can easily be found.

J. FRANK LOCKE

PILLSBURY, Minn.

## A TRIP AFTER QUAIL.

DURING the month of February last, Teceel, Mud, Wells, Jr., the odontist, and your correspondent, got everything in readiness for a sporting tour around the Cleveland Springs. The trip was planned for the purpose of being fixed with a view especially of suiting the convenience of two of our friends, who reside in what was once called "the city of magnificent distances," one a banker, and the other an attorney; and another who lives, and, I trust, flourishes, in that smoky location at the confluence of the Allegheny and Monongahela. It so turned out, however, much to the regret, no doubt, of all these gentlemen, and certainly to ours, that business considerations prevented our participation in the sport which we had reason to believe lay in store for us. The very pleasant and generous gentleman who is the proprietor of the springs, had given us assurance that birds were quite as numerous in the section around him as they were on a former visit of ours and with this we held out the promise to our metropolitan friends, and to him who lives at the confluence aforesaid, that a reasonable quantity of shooting could be had; and besides, they could drink, to repletion, of the waters of as fine a sulphur spring as flows from the bosom of earth. And, all this, at such a charge as would demonstrate that the proprietor had no idea of making a fortune out of his sporting guests. The table, we knew from past experience, would be supplied with "the best the market affords," and perfect freedom allowed to those who found shelter under the roof tree. If they could be joined in it, I knew them well enough to believe they would have had an exceedingly enjoyable time, even though they may not have distinguished themselves very much by their successful achievements in the field. It is certain that we could have killed as many birds as we could have consumed, and when night came, and before retiring to rest, they could not only have entertained us but been themselves entertained by the comicalities, and eccentricities, and weaknesses, and amiability of one of our companions. We all hope that, at some future day, nothing will intervene to prevent our meeting where birds are abundant, weather propitious, and dogs well trained to the business in hand; and we will endeavor to demonstrate to them that this good old State is destitute neither of respectable gentlemen nor enticing amusements. If this should meet the eye of either of them he will understand the invitation is sincere and comes from one whose "tongue knows no flattery."

According to agreement, our friend who was to entertain us met us at Shelby with the necessary teams for our transportation; and our dogs, Nip, Branch, Argo, Lena and Jack, the last named a pointer, without education, got an opportunity of stretching their limbs, somewhat cramped by railroad transportation. They "skipped on, through dirt and mire," at a lively rate for two miles, the condition of the roads in this section, notwithstanding the fact that the highways to the exercise of a due quantity of patience on account of the slowness of locomotion. Then the welcome sight of the main building and the white cottages around the springs betokened that a place of rest and refreshment had been reached. Dinner was soon announced, and hunters and dogs were abundantly supplied. Inasmuch as the afternoon was lowering, with rain enough to make walking quite uncomfortable, we contented ourselves with remaining under shelter, trusting to have plenty of time during our stay to indulge all our shooting propensities. This pleasant anticipation was doomed, as many others have been and many others will be, to great disappointment.

On our way from home, our companion, whom I have hitherto in several communications called Mud, but whose name is something made out of mud, and after being finished after being molded into rectangular blocks, dried and burned, constitutes a very essential part of all edifices, to whatever purposes they may be applied—a gentleman of education and high social worth—felicitated himself that he would have the good fortune to have Mac, our host, as his hunting companion, whom he knew he could beat in the use of a gun. His "first sweet draught of glory" he took in contemplating his daily triumph over the surety bond. He never doubted nor conveyed the opinion that with his little 16-bore he could "lick out" his competitor and be euphemistically the "Big Ike" of every day's tramp. Soon after getting to the springs we duly advised Mac of the anticipated joys of Mud, and urged him to do his utmost to deprive his antagonist of all his expected joys. The next day we separated, Teceel and I going together, while Mud and Mac, with the odontist as a guide, took their another hunting ground. Our party had a long tramp, our dogs hunted well, and we did some gentle shooting, but only succeeded in getting sixteen birds, each bagging the same number. Being generally within hearing, we were aware of the fact that the other party were doing no little shooting, and expected that on their arrival at the house they would report a corresponding quantity of booty. We were looking forward, too, to beholding the face of Mud, radiant with smiles, and his tongue glib on the excellence of his scholastic performances. I am not sure there is any such word in the last adjective I have used, and if there is, that I have given it its proper signification. But, like many other persons who write for the press, I use it for the purpose of impressing my readers with the conviction that a man who uses sesquipedalian words of recondite signification is possessed of unusual attainments. But when the glooming had come and the trip made that appeared as a vision of Mud plainly indicated that his anticipations had been mere "castles in the air," "baseless fabric of a vision." He had a melancholy and dissatisfied look—the very personification of disappointed ambition.

"What luck, Mud?" anxiously inquired Teceel of the disconsolate Nimrod.

"Oh, let Mac tell it. I am disgusted with the whole business, and feel like kicking home at once."

"Well, Mac, did you not kill the specimen of humanity have his aspirations gratified? How many birds did you all get?"

"Thirteen I believe," modestly answered our host.

"How many did Mud get?"

"I think he claimed to have killed three, but I am not sure that he got more than two of them."

"How many did you kill?"

"Eight."

"Did Mud shoot much?"

"Oh, yes; he shot over twenty times."

"Now, Mud, you are a pretty fellow; coming all the way up here with your premier little Scott, that an unappreciative Chatham darkey thought 'mout' have cost you nearly fifteen dollars, bragging that you were going to beat Mac any way; and yet, on the first trial, got sadly used up. I

reckon you will hardly call out to John Tole from behind the cynomys hedge, and ask him if he has heard the score of the Cleveland hunt. 'Now will you?'

"Hardly," meekly answered the great disappointed.

After much more battle-door logomachy we retired to our beds, slept soundly, and were ready for breakfast the following morning, our friend with the clay name, as usual, bringing the rear. At home he fills the important position of a justice of the peace, and has constructed the habit of doing everything with judicial deliberation. Indeed, he is a living exemplification of "*Curia vult adesti*." In this, and many other respects, he differs, very widely, from a certain magisterial official, who derived his civil authority from a military satrap who ruled over us some years ago. This fellow, who might have not fully disgraced a pickax or dungfork, and was certainly ignorant of his position, not long after he wrapped the emine around him was engaged in a conversation with some gentlemen, who were forced to tolerate him, and in the progress of it expressed great surprise at the hesitancy of our real judges in pronouncing an opinion or a judgment upon matters at issue in their courts. "Why," said he, "I find no difficulty in deciding all questions which come before me. Just as fast as a lawyer raises a 'pin't I brush it away and dispatch business! The law—why it ain't nothing to learn."

The weather was exceedingly unpropitious during most of our stay at the springs, and in consequence, we did comparatively little hunting and with poor success. The last day came, and though the sky was gloomy, and light showers occasionally fell, Mud, Mac and I had the hardihood during the afternoon to venture out to Buffalo Creek, a distance of about four miles, and six miles from King's Mountain station on the Atlantic and Charlotte Railway, and it is there we heard repeatedly what we supposed to be the gun of Capt. W. B. R. Tell, who has a flourishing school at the station named, and who, on Saturdays, indulges his fondness for shooting to relieve himself from the weekly moil of "teaching the young idea how to shoot." We found several coveys, and Mud and I did some fair work. Just before dark, however, after we had started for home, one of our dogs set birds on the side of the road. We went to the vehicle, and each one of us got a shot; I only getting a bird. Pursuing Mud got seven shots, and no meat. I was close enough to hear, not only the report of his gun, but his observations, as Bob White whirled away to some other retreat from disturbance. Though ordinarily very slow in his movements, I know no one who can shoot with more rapidity than the fellow who has just been described. After each discharge he would cast a desperate look toward his comrade, and lugubriously ask, "Mac, didn't I hit that bird?" Now, Mac is a truthful man; but, being full of the "milk of human kindness," is so averse to saying anything to wound the feelings, that when he is put upon his "hair div," he manages, while sticking to principle, to make his utterances as soft and soothing as possible. His answer always was, "Well, I thought he shot him." I was something white near by, and I reckon it could hardly have been the wad. Whatever it was, it is certain that no birds went into his pocket. Just as we were about to enter the carriage, we met with a man who lived in a house near by, who, in a conversation told us that an old lady was sick at the house with "new money."

We had gone on about a half mile, facing a keen north wind, which made us wrap our blankets closely around us and inspired us with no temptations to indulge in conversation, when Mud suddenly removed the covering from his face, and with slow, measured voice disturbed my reverie by saying:

"I'll—tell—you—how—I—happened—to—do—such—a—shoot—this—evening. The—old—lady's—sickness—bothered—me."

"The thunder it did," said I. "You didn't know it until after you had got through."

"Oh, yes I did. Didn't we see the doctor's horse there as we went on?"

"Certainly, and the doctor, too; but it does not follow—or, as you judicial gentlemen sometime say, *non constat*—somebody is sick whenever you see a doctor."

He subsided into silence, which he maintained until the horses were well advanced, and then he got to the blazing fire and rubbed his hands in token of its comforting influence. Teceel and the odontist were there, and the former inquired:

"How did you come out this afternoon? You look as if you had had poor success. Wells, what is the matter with him?"

"Nothing, except sympathy. He heard that a good lady was sick in the neighborhood, and did some bad missing in consequence of the information."

At this he "smiled a sickly smile," and inquired how long it was before supper. To his great satisfaction this was soon announced, and at the table he wreaked his vengeance on the birds which had escaped by devouring quite a quantity of those which had been put in the frying-pan.

Then we sought the fire again, and talked over the incidents of the day, until your correspondent, who is a "Jack at all trades," suggested that he would proceed to sketch Mud's picture, just after one of those misses, occasioned by sympathy for a woman's bodily sufferings. Paper was handed him, and very soon he had several pictures of the unfortunate sportsman ready for inspection. Mac was so highly pleased with them, that he begged the limner to give them to him, so that he might have them framed to adorn his wall, and make one wall adorn another. He has them now, and visitors to this health resort, during the coming summer, who are fond of the fine arts, can amuse themselves by looking at them, if they will ask the proprietor for the privilege. Teceel wanted me to sketch Mud's appearance at a store in Montgomery county, while he was giving admiring glances at the proud father of female triplets, weighing 31, 32 and 33 pounds, and, no doubt, sincerely wishing that such extraordinary visit his brother might have been the "Burns" did, when he acknowledged the inability of his muscle to sing how Nannie poe and flang, he conceded his incapacity to do that subject justice, and he pocketed his pencil, fully satisfied with the work he had already done.

Now, no one must understand me as wishing to do injustice to Mud. He is "a gentleman and scholar," a friend of mine of "adoption tried," and well worthy of the respect of anyone. To those respecting him, he has been a "good friend," and, at least, serve the purpose of adding to the enjoyment of his associates. If I speak of them, it is only to do him a kindness, by holding up the mirror so that he may "see himself as others see him," and be thus enabled to avoid the Scylla and Charybdis of his weaknesses. If you want his company on a hunt, and tell him you propose taking one, at a given time, and ask him to join you, his reply is almost,

ally. He should observe, also, that in making the horn he does not get it too thin. It ought to be nearly, if not quite, an eighth of an inch thick. If so, it is less likely to get cracked, and besides, can be heard further.

Now, if I have succeeded in giving your correspondent, or any of your readers, a point of information touching the subject of which I have written, I shall esteem myself as fortunate. WELLS.

#### INCIDENTS OF A FRONTIER MARCH.

IN August, 1879, I was with a small detachment of men—eight men and ten horses—in Long Valley, on the Payette River, Idaho, when we suddenly came upon an old female grizzly bear with two cubs. One of the party—an old bear hunter—dismounted and another, mounted, started after the bears. The old one would rise up—she seemed as full as a man—look at the advancing man and horseman, then get down and trying to keep her cubs in front made for the woods, 200 to 300 yards away. As soon as the men began firing she ran off leaving her cubs, which were soon dispatched.

The night before this occurred—just as we were going to camp—a large cinnamon bear and a cougar (mountain lion, *Panthera felis concolor*), jumped from the banks of the little stream we had selected for a bivouac. The cougar leaped over the fence and shot and made the forest resound with the most terrific yells I ever heard. This notwithstanding a recent writer in the *Naturalist* states that panthers do not yell. The cinnamon also escaped.

These animals were not twenty yards apart when we first saw them, and we were not more than twice that distance when they jumped, as our horses did too.

The horseman in the chase after the cubs rode two or three times almost over a fine buck, which was lying in the tall grass. The buck bent his head down close, but did not stir. After the cubs were secured, a man walked up to within a few yards of the deer and fired; he jumped up and ran off, but was brought down very prettily by the next shot before he got out of range. We left the deer and bear, to push on to camp, intending to return in the morning. Returning we found only a portion of the deer left—the rest having been eaten by our old bear or a cougar. Being short of rations we skinned the cubs, but found their flesh so strong as to be unpalatable. Black and cinnamon bear meat is not unpalatable, but from grizzly, young or old—spare me. How we worried on over mountains, through burning forests, for eight days, with only a foot-heel and a salmon to stretch out the three days' rations we started with, is all too personal to be of general interest. We found that coffee grounds eaten after drinking the decoction were of considerable service in keeping up the spirits.

The railroad has now almost reached Boise, and made accessible the Payette (upper) and Salmon River mountains, where can be found as fine sporting ground as America affords.

T. E. W., U. S. A.

VANCOUVER BARRIERS, Washington Territory.

In a recent issue "P. E. B." of Weld, Maine, says some true things of the bear's nature. He says, "the mothers of all animals stand by their young and fight for them as a general rule, especially if the infant is in trouble, and gives the alarm of distress." This latter clause is one of the principal incentives of the bear's anger toward mankind, as I may partially illustrate by the following incident:

In the winter of 1878-79, while stopping at Crystal River, Fla., some timber cutters came up from the islands on the coast, and reported a bear's nest with young, and wanted Nick Barco and myself to go to turn them and get the young ones. We set out the next day, arriving on the ground just before sunset. All hands being anxious to see the bear and hear the cubs playing among themselves, as had been reported, we determined to go to the nest that day. We accordingly went within twenty-five or thirty feet of the nest, and could easily hear the cubs, but could not see them, and we decided that the wisest course would be not to disturb them until we were sure that the mother was disposed of, as, if we set them to crying beforehand, the mother would realize their danger and fight more than we desired. This theory proved correct in this instance. After about a half hour of searching, and wishing for the bear to show herself, Nick discovered her through the brush, walking toward the nest, and when within about two feet of it he fired a charge of buckshot into her side, when she immediately returned into the thick brush the same way she came, growling and snarling the way. About one hundred yards from the nest she lay down, and never got up. After satisfying ourselves that she would not come back, we took the young—three altogether—one having a few white hairs on her breast. The young were quite small—could be held on the hand or put into an ordinary quinine-coat pocket. Their eyes were open and blue, but they had no teeth when taken. They began to cut their teeth about two weeks after.

A. B. D.

NEW HAVEN, Conn.

#### THE NEW YORK SOCIETY.

THE last of the spring meetings of the New York Association for the Protection of Game was held at Pinard's on the 8th of Monday. The President, Hon. R. B. Roosevelt, was in the chair. Mr. Thomas N. Cutter, Secretary, read a communication from Mr. William J. Weldon, Rouse's Point, N.Y., calling attention to the large quantity of fish caught by nets in the waters of Lake Champlain and in that vicinity during the spring and summer months. The writer asks if there is no law in the State of New York whereby fish caught by nets in the waters of other States, but sent to the former State for transshipment or sale can be seized, or if there is no fish or game constable in that vicinity to look after that unlawful traffic. Surely, the writer says, something should be done without delay to stop it. The communication was referred to the Committee on Game Laws.

The Townsend and O'Connor bills for the amendment of the existing laws for the protection of game, now before the Legislature, were discussed and referred to the Legislative Committee on Game Laws, with full power to act upon behalf of the association in relation thereto.

A communication from the State Association was received asking for prizes to be donated to the coming convention. After some discussion it was decided not to offer prizes for pigeon shooting. A motion was then made to encourage fly-casting at the fall tournament of the Rod and Reel Association by offering a prize. This was also lost.

The Chairman appointed Dr. John W. Greene, ex-Senator Alfred Wagstaff and Mr. Wisner H. Townsend delegates to

the annual convention of the State Association for the Protection of Fish and Game, at Niagara Falls.

Mr. Myers thought that trout should not be exposed for sale early on the morning of April 1, as it was plain that they had been caught the day before. The President remarked that the association had this question before them often before and had declined to express any opinion on it. He then asked Mr. Blackford, who was the guest of the evening, to give his views on the subject. Mr. Blackford said that it was a question that had been put to him often. He instructed his men to scrutinize all boxes of fish sent to and received from the State. The law allowed them to do that at that time, and he did not see why he should decline to sell them as long as all other dealers had them. For himself, he was a strict observer of the laws, and if it appeared best to make the law so that trout could be caught on the first day but not exposed for sale until the second he saw no objection to it. All dealers would then be on the same footing.

Mr. Blackford also said that the difficulties in the way of enforcing the game laws were growing less year by year. The public were being educated up to the matter, and market-dealers appeared to be willing to do all in their power for the protection of fish and game. He understood that a bill before the Legislature proposed to increase the number of State Game Constables by appointing eight additional men, and suggested that the association should use its influence to secure the appointment of two, to be located in New York and Brooklyn.

At the close of the meeting the members of the association enjoyed their customary supper, which was served by Pinard. After coffee and cigars had been served, President Roosevelt gave an interesting history of his fishing and shooting experiences in Southern waters.

#### DAKOTA WILDFOWL NOTES.—Crow Creek Agency, D. T., April 4.—

We have just had a second edition of winter here. About three weeks ago the ducks and geese began to show themselves. As we were having some fine warm weather the Indians began to plow, and had sown considerable wheat, when we had a radical change; the thermometer went between 70° and 80° down below zero in six or eight hours, and since then we have had a continued series of snowstorms until last Monday, when the sun came out and the wind came round into the south. The ducks and geese at once took advantage of the weather and the shooting was quite heavy. Since then the wind has changed into the north, and the flight of geese has about stopped again. The ducks still stay around. I went out last night and got my first ducks for the season. I killed three bluebills, one mallard, one redhead, and one green-winged teal. I killed them in some little pond holes that were filled by the melting of the snow. Some of your correspondents complain of the inevitable "war with the north" in the South (though I see why the poor negro with his \$2.50 Zulu is not as much entitled to his ducks and geese as is the white sportsman with his Westley Richards hammerless gun, with Witherth's patent fluid compressed steel barrels at \$755.00.) Here it is the poor lone Indian, and he does not have the Zulu, but the antiquated old muzzle-loader or musket cut off. We will generally find him just ahead of you, and if he does not make out all the game, he will surely scare them away. —POTTER HENRY-HA.

DAYTON, O., April 9.—Millions of mallards and fat little teal are now warning in the spring marshes and lakes of Ohio, Indiana, Illinois and Iowa, and the hunters are banging away. It is too early yet to write of fishing, but mention that the true knights of the joint rod are planning for the May raid among the bass of old Erie. Woodcock came to the Miami Valley about the middle of March, although not plenty. Snipe are coming in, and the hunters, so long idle or crouching over stories of former exploits, are rising up to try their manhood. On Friday April 8 several parties went to the Carlisle lakes, while others hunted through the marshes at Byron and Frost's. Gustav Sander and Charles Whelan bagged seventeen snipe and twenty-two plovers; John W. Dickson and Adolph Sander got an equal number with the first party; John Stecklein and Mike Donohue brought in nine; and the next day Phil Wenz bagged twenty-four birds. (Quail were so scarce last fall that the dogs had no very true of it; therefore will acquire a preference from setters to pointers. A pair of young black ducks (wild), caught on Lake Ontario, were presented to Phil Wenz, a miller below Dayton. Last fall they started to fly away, but, making a circle of several miles, came back, and flying around for awhile, returned to the pond near the mill and have never since tried to leave, although often uncensured. The hen has been laying, and two broods of young ducks will be hatched. —SINEX.

CHICAGO NOTES.—Chicago, April 14.—Chicago sportsmen have had a surfeit of shooting, and in spite of all this, there is little news to chronicle. The ducks have been very plentiful in all varieties about the city, but the game law of the State of Indiana closes on ducks to-morrow, Sunday, April 15, and as most of the Chicago clubs have their club houses in that State on the northern water courses, it can be seen by the readers of the FOREST AND STREAM, that this will throw a damper on the boys. Still many are out industriously looking for snipe. The latter seems scarce as yet. Abe Kilman, the veteran shot, has just returned from Lake Seneca. He has been there for six weeks and killed plenty of ducks and some snipe. He reports the shooting at this little Illinois lake as being very good, but says he left only little fellows. Ed. Price and James Watson returned yesterday from English Lake, where they had a fine time. Wirt Dexter, our great lower sportsman, has been enjoying good shooting at New Barton Bay, on the Mississippi River, just above Keittsburg, and where he has a steam yacht as a hunting boat. Lydian, Ed. Organ, Pond, and the rest of Chicago's great hunters have been out to the various club grounds. Matters are quieting down. —SPECIAL.

#### MAINE NOTES.—Oxford, Me., April 13.—

Wild ducks were seen to-day for the first time this spring, flying northward in small flocks. The boys are having fine sport banging away at the muskrats, of which there are plenty. Excellent black bass fishing can be obtained here after the first of July, boats, guides, etc., at reasonable prices; also good pickerel fishing. The Oxford Gun Club voted to go to Rangeley the 1st of June. Now look out for deer. —L. N. E.

#### MAINE DEER BUTCHERS.—Oxford, Maine, April 16.—

*Editor Forest and Stream:* For several years a herd of deer have been known to roam about the vicinity of North Waterford, and have been allowed to go unmolested, though at times their winter woods have been within a few rods of the highway. On the 27th of March some men came from Lovell, Me., and gave chase and captured two deer, which they took away in a pump. A few days after they captured a third doe and two bucks, which later, being unruly, were hitched up to a tree and very conveniently strangled themselves while the men were taking the doe away. Another deer was run down with dogs, and was said to have been so mangled that it was necessary to kill it, and was dispatched by Stoneham, Me., parties. There is considerable indignation expressed by the North Waterford people, and without doubt the matter will be thoroughly investigated. The law prohibits hunting for or destroying in any manner any deer between January 1 and October 1; and, it would seem that this properly came under its provisions, to say nothing of the premature birth and death of a pair of young fawns after the capture of one of the does. This style of hunting is getting to be a little too common. Only a few days before a similar case was reported from one of the towns further north, and I have been told that parties in Newry have been indicted and fined for a similar offense. The law is evidently intended to protect the deer through close time, and I fail to find any provision for taking them, even alive, during that time. These cases will probably settle the question. Any person may lawfully kill any dog found hunting deer. If people will generally follow the example of our North Waterford neighbors, there will be less difficulty in enforcing our game laws, and there will be more game. —SYLVAN DALE.

#### WILD TURKEYS IN CALIFORNIA.—

We find the following item in the Los Angeles Times of recent date: "Wild turkeys are now to be seen on sale at San Francisco poultry stands—the first that have been noticed by the press of that city, we believe. They are claimed to be the produce of the pioneer wild turkeys of California, came from Arizona, and are selling for thirty cents the pound. The *Call* says the progenitors of these birds were brought from the East at a cost of \$40 each, but we have an impression that the first wild turkeys brought to this State were imported some years ago by Judge Caton, of Ottawa, Ill., and placed on the Island of Santa Cruz, where they have thrived and multiplied greatly. They now afford fine shooting. The American wild turkey is a noble bird, and there is no doubt to hold that it should have been given the place of the national bird of freedom instead of the eagle. Its acquisition by California will prove a substantial gain to the game list." This is the first we have read or heard of there being wild turkeys in this State, if we may except an instance in which some domestic turkeys left a ranch near Pico, Placer county, last year, and took to the brush, where they were at last accounted, having become wild. Any sportsman could wish they have not been killed off, as they must increase and in the course of time furnish good sport for gunners. —Sacramento Bee.

#### PINNATED GROUSE FOR DELAWARE.—

The Delaware State Game Association are about planting one hundred prairie chickens in their State. There are many sections of Delaware where the pinnated grouse will thrive, and we are sure this enterprising society will see to it that the birds are protected. The association intends also to stock the waters of the State with game fish. The national young shooting season be placed in the Delaware River by the New Jersey Fish Commission. —HOMO.

Philadelphia, April 16.—It is positive that some of the pinnated grouse put out in New Jersey by the West Jersey Game Protection Association have lived. Several have lately been seen near Hammonton. Mr. John S. Davis, well known in Philadelphia as a student and observing sportsman, while stopping near Amulius, N. J., during the past season, put up one, which he certainly identified as a prairie chicken, and another bird during the same day which he thinks was of the same species. The first got up near him, and he heard the peculiar note which the pinnated grouse gives when startled. Mr. Davis knows what a prairie chicken is, and with the writer on Western trips has shot many. —HOMO.

MICHIGAN.—Grand Rapids, J. C. Hazard Card, of Pleasant P. O., Kent county, Mich., killed an American swan, (probably a last year's bird) on Cranbury Lake, lying partly in Alpine township, Kent county, and partly in Wright township, Ottawa county, Mich., on the 11th of April, out of a flock of forty-two birds. This bird measures six feet three inches from tip of tip of wings, and four feet one inch from end of bill to tip of tail. Weight 14 lbs. 8 ozs. It is in immature, slate and reddish-brown plumage. My informant could not tell as to the size or color of the rest of the flock. The evening before this bird was killed a large flock passed over this city, swinging around from north to west and northwest in the direction of Cranbury Lake. That night a severe storm struck us from northeast. —E. S. HOLMES.

#### TENNESSEE.—Nashville.—

L. Valentine, Burt Bray, and J. N. Brooks, recently killed one hundred snipe and twenty ducks, near Bowling Green, Ky. Several fine bags of snipe have been made here, the birds being more numerous, and remaining longer than usual. —J. D. H.

MINNESOTA.—Mantorville, April 10.—Ducks have not been as plenty before for three years as they this spring.

MESSRS. W. C. Birchmore, R. S. Gilliam, Jim Porter and Frank Gilliam tramped down in Greene one day last week to take a bird hunt. They passed one farm and kept up such a shooting that all the negroes thought that there was another war on hand. One was burning brush, and he threw his coat in the fire and ran to the house and fainted, hallooing judgment. Another said he heard some powerful bluffs over about Fowell's mills, and a white man said he'd be d—d if an accident happened, whether a copperhead or not, that farmer had his children cutting briars, and he sent them all to the house and locked them up, and whipped some of them because they looked out the cracks. That was a day of demoralization in this country, and the next day some of our boys came to Maxey and swore one of our boys had done damages against the parties, but the hunters compromised. This is no exaggeration, but strictly facts, and they bagged fifty-seven birds. —Oglethorpe (Ga.) Echo.

## Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

### OLD ANGLING BOOKS.

A SHORT time ago we noticed the new edition of the "Bible of Piscator," by Messrs. Westwood and Satchell. The revision by Mr. Satchell was entirely a labor of love, and he has rendered angling literature a great service by not taking his information at second hand, and in consequence his book is of the greatest value possible and one that the buyer of angling books can not well dispense with. As instances of the thorough manner in which he has done his work we give the following:

The "Treatise of Fysshynge," etc., attributed to Dame Juliana Berners, or Barnes, was looked up, not only in the different editions, but also in the manuscript. The only known manuscript of the "Treatise of Fysshynge," printed in the 1496 edition of the "Boke of St. Albans," formerly in the possession of Mr. Herbert, afterward of Mr. Haslewood, and now in the famous Denison collection, has been examined by Mr. Satchell. He finds it to contain an independent text of a date not later (says Professor Skeat) than 1450. It is drawn from the same original as that printed in 1496, but instead of the "rendings between it and the printed copy" being, as alleged, (Pickering's reprint, 1837, preface) "very few and unimportant," it varies the phrase throughout, and in many places varies the sense, besides containing many short passages not included in the printed version. Mr. Satchell is preparing the text for publication, and as it is unfortunately imperfect, will supply the *lacunae* from the volume of 1496, which will also be printed by him with a bibliographical introduction, the matter on each page of the two volumes being made to correspond to facilitate comparison of the two texts.

The same careful search in Walton's work has revealed some new points regarding the first (1653) edition of the "Compleat Angler." Mr. Satchell has noticed that there exist two impressions of this book, or certainly of signature F., and he would be glad to have the reports of possessors of the volume as to which of the two their copies belong. One has the woodcut at the foot of page 81, with the words "the description of a trout" above it; the other has the woodcut in the text, seven lines from the bottom of the page, and without superscription. The three copies in the British Museum are all of the latter form, while several copies in other collections prove to be of the former.

Mr. Satchell's address is: Thomas Satchell, Downshire Hill House, London, N. W., and we hope that any of our readers who may have the books in their possession will communicate with him.

#### An Angler's Look "Around and About."

"Fishing weather's coming, lads,  
The winter days are past;  
Dusk and hoar-frost will awhile  
Rob the streamlets of their smiles,  
The landscape of its grace."

IN this fickle climate the first day of April is far from a genial one, but, at its approach, the angler begins to feel in a different mood than on long days past, and eye and hand take the "line of direction" to the shelves where his angling hooks repose and to his tackle stored. His fishing blood begins to warm and his pulse to be feverish, and at the least suggestion of his pastime his thoughts run riot.

"Sleeping we dream of what, awake, we wish—  
Dogs dream of bones and fishermen of fish."

On a passably fine day in early spring it is pleasant to walk by an old fishing-haunt and see the swollen stream prepare itself for the "open" season. To let the thoughts "hark back" to past successful days, hither and yon, or to forecast the possible creels yet to be. Even to look upon a favorite "water" from afar is very pleasant, and one returns to his fire and "Walton" with a new and grateful zest. After such a reflective, or prospective, glance, it is need to "overhaul" one's "kit" and make ready for the first east of the season.

This fly, or that leader, may have pleasant tales to tell of bygone sport, and a glance into the well-worn creel will reveal—O, what fine specimens of conditioned trout, to be forever served up for memory to dine on. There are many streams in the walks and drives of the angler that make him sad, because they are no longer tenanted. To the eye, how promising are many might have saved the waters their foul degradation, and the trout might be as lusty therein to-day as the trout "forest primeval," before greed and utility had robbed an equal right to its own.

Many a time and oft have I stood upon a certain road bridge I wot of, a bridge spanning as likely a bit of trout water as one need care, and sought a "rise." It seemed as if there must be fish in that "deep," and I would not cease trying till I have been compelled, again and again, to do so from lack of any known lure. Then have I filled my pipe and sighed "it might have been." This refrain is as bitter a charge for a pipe as it is for the heart, and after a little the "fragrant leaf" seemed to be void of solace, and I turned the ashes upon the lonely waters, where they dispersed like fond hopes upon Life's fleeting tide. But, avant, melancholy the growing, budding year is no time for sadness, and the fisher's heart

should not long brood over a fishless water. There are well-stocked streams yet to be cast upon, and the time is not far distant when the now troutless ones will be cleft with their swift fins and glowing with their bonnie sides. Let us take heart of grace, enjoy with gratitude, and "preserve" with zeal.

"Tis life to young anglers in early spring time,  
In the spring time all so fair,  
Through the meadows to go, where primroses grow,  
Absorbing the sweet, mild air,  
When the butterfly comes and the great bee hums  
Round the sweet bled gossling clad,  
And a 'twit, 'twit,' sing the dicky birds sweet,  
Then the heart of the angler is glad."

The first spring duty (due to his own personal self) of the angler is to see that his tackle, every minute detail, is in prime and thoroughly usable order. Rods, flies, leaders, reels, lines and hooks are a nockery and a snare—to the temper, not to the fish—if they are in a condition to prove a failure at the critical moment. I once fished with a friend who had left his bait behind him, at home, distant several miles. Fortunately, I was well provided to share with him; but "it might have been" otherwise, and our long-expected fishing day have proven a blank one—i. e., as to well-stocked waters. This, the angler was a ludicrous and unusual "accidental occurrence" to a careful and precise angler; there fore, the more careful ought those of an opposite class to be. Hold hard, there! My homily is ended, brethren of the angle, and its application may be made by whomsoever will.

The winter, also, is ended, and the face of nature begins to smile; the meadows will soon be "wearful of the green," and, before we are aware, the May fly will be dancing its brief life over many a "pretty water," and may we "peek here to see." To see? Yes, to see and to feel the resistance of the trout as we "strike" and prepare for—what the fish may be preparing for us!

"Fishing weather's coming, lads,  
Look to your rods and flies!  
Winter soon shall pass away,  
Hope and spring will gain the day,  
And sport delight your eyes."

O. W. R.

### FLORIDA FISHING.

I HAVE just returned from a four months' trip to Florida and traveled quite extensively over the State, including the Kissimmee country, Indian River and the lake region. Everywhere I went I tried the fishing, and on the whole, the results were not satisfactory as to the catch, but I enjoyed the fishing all the same.

I first tried fly-fishing for black bass in the large lakes about Maitland and Winter Park in Orange county, in the month of December, but while I saw plenty of fish jumping, it seemed almost impossible to take them, although I tried live bait, trolling, bobbing, and fly-fishing, at all times of the day and in all kinds of weather.

An old settler here said that there was hard to take because the water was too clear. So I do not go to the clear water lakes of Florida for fishing at the same time of the year that I did.

The month of January I passed at Kissimmee city on Lake Tahopokigala, and in this lake I had all the fishing a sportsman could wish. The water in the lake is coffee-colored like the water in the St. John's River. The lake is about twenty miles long and about twelve miles wide in its widest part, and has a uniform depth of about twelve feet, and contains plenty of large-mouthed black bass, pickerel, grinnel and catfish. I saw a man there who told me he caught a black bass by trolling that weighed fifteen pounds. The largest fish I caught was an eight-pound bass, five-pound pickerel, and a twelve-pound cat. The grinnel are very plenty, large and very voracious, and give good sport with rod and reel. The twelve-pound cat I captured with an eight-ounce fly-rod. The blue cat are not to be despised; they are very fishy and abundant sport.

I reached my particular favorite spot by pulling across the lake from Kissimmee city to the mouth of a run a few hundred yards to the northward of what is known as Excelsior Island. There is a deep hole there, and I have had four fish hooked on four different lines at the same time, and as three of them were attached to light fly-rods, you can easily imagine the sport and excitement.

F. W. DICKINS.

### VERMONT AND CANADA NOTES.

I HAVE at this moment received a letter from an old sporting friend who resides in Franklin county, Vermont, giving me the welcome news that the lovers of the rod and gun in that country have at last thrown off their lethargy and have formed a society there for the purpose of protecting fish and game, and also will make an earnest effort to restock the depleted waters in that vicinity. Hon. Herbert Brainerd, one of the State Fish Commissioners, offers to procure for the society a quantity of *S. fontinalis*, rainbow trout and land-locked salmon fry, so that they can begin their work at once. You have started the ball, and now, gentlemen, keep it rolling. It will be uphill work at first, but energy and perseverance will surely overcome all obstacles.

Two of the most noted net-fishermen of Swanton, Vt., Messrs. Donaldson and Helliker, were a short time ago arrested while pursuing their nefarious work, and we are watching the action of those who have taken their punishment in hand, to see if it will be dealt out to them as they deserve, in full measure, or that it will be allowed to fizzle out and no good results come out of it. These men have openly violated the fishery laws for years, and have made it a standing order that they would, and in spite of the game officers continue to do so.

I passed the Matapedia and Restigouche rivers a few days ago and they were firmly ice-locked, and will continue in that state for some weeks yet. The trout and salmon season in the province of Quebec and Maritime provinces will open late.

As the pike-perch, or as we call them "dore," taking fly, it is common occurrence to take them in the St. Lawrence, Ottawa and Richelieu rivers, during the months of July and August, after sunset, on a white-winged fly, but during the daytime a live minnow is the most killing bait. In our cold Northern rivers they are a game fish, first cousin to the black bass, and when broiled are nearly equal to the bass in flavor.

STANSTEAD.

- RUTLAND, Vt., April 10, 1883.

### THE SECRETS OF SALMON GROWTH.

[From Blackwood's Magazine, February, 1883.]

ALTHOUGH the salmon has been asked, again and again, to render up the secrets of its life, it steadily refused to reveal the number of its days, or the time-table of its progress: from the moment it quits its watery nest till the period when it finds an honored place on our dinner-tables, many of its movements are shrouded in mystery. As was said once upon a time by the Ettrick Shepherd, who was a keen observer of the habits of *Salmo salar*, "Whereabouts it takes to when it is putting on its flesh, or how long it takes to garnish his banes, neither me nor Charley Purdie can tell—it's a problem." And a problem, of the most tenacious and puzzling kind, it will remain to the days of a salmon in the waters, and to use another phrase of James Hogg's, "How the fish fills its time" from its cradle to its grave, are still puzzling questions alike to naturalists and fishery economists; while to the general public the ratio of growth of that or any other fish is, at all times, as a seal-a-book. When pater-familias is selecting the middle cut of a choice 33-lb. fish with which to grace his dinner-table and honor his guests, it may probably occur to him to ask his fish-merchant what the age of that fine salmon perchance may be; but the fish-merchant is most likely as ignorant as himself, and cannot tell him. Notwithstanding that the fact of its origin and incomings has been frequently diagnosed, the time-table of salmon life is full of mysterious blanks; it is in vain that men have assiduously watched these fish and taken note of their growth, and tried to find out at what periods they become reproductive, and at what age they die—such labors have not added much to the sum of our knowledge.

Taking the salmon with which we have started as a basis of argument—the 33-lb. fish referred to—it would be interesting indeed if its age could be correctly determined. Absurd stories and ridiculous conjectures have, we know, been at various times circulated about the rapid growth of this fine fish, but most of the tales told have required a very large pinch of salt to make them palatable, so manifold are the perplexities which beset the growth of this "monarch of the brook," and so numerous and so unaccountable are the facts has to encounter before it attains a weight of 33 lbs. avoirdupois! One of the controversies which environed the early life of the salmon has been singularly difficult to "put to silence." The "parr question," as it was called, had lasted and raged for sixty or seventy years, during which period the war of words and letters had been imbued with such a wonderful amount of vitality as to keep all who were interested in the natural and economic history of the salmon in a perpetual state of excitement. The part question is an old story now, but it is one which will bear to be told in a brief fashion.

Long ago—and to-day as well—many rivers were found at a particular season to be populous—to swarm, in fact, with a small finger-marked fish, which in Scotland was known as "the parr," but in England was called a "smelt" or "brandling." Sixty years since there were men, naturalists and other experts, who said that these young things were "distinct species" and "not the young of salmon." Indeed, some of the more learned of the brethren—Sir Humphry Davy was one of them, Dr. Knox the anatomist was another—said the parr was hybrid. Mr. Yarrell was pretty much of the same opinion, although he was less decided in his utterances than some other naturalists. In one place he states the prevalence of an opinion that parrs are hybrids and all of them males. His reason for saying that the parr is not the young of the salmon "is that it is so different in its wing scales." "That the parr is not the young of the salmon," or, indeed, of any other of the large species of salmonidae, as still considered by some, is sufficiently obvious, from the circumstance that parr by hundreds may be taken in the rivers all the summer, long after the fry of the year of the larger migratory species have gone down to the sea.

To have said in those days that the parr was the young of the salmon was to court abuse, at least ridicule; but for all that, there were men of original views who held the belief that the little fish which were so plentiful were undoubtedly salmon in an early stage of growth, and that, in time, they would obtain the dignity of scaled fish, and be recognized as smolts—"smolt" being at that date the name given to the recognized young of the salmon. Among those who so believed was James Hogg, to whom reference has already been made; he repeatedly declared, with all his might, "that he had seen very fine parrs, and that, in other words, that he had more than once handled a parr just as they were becoming smolts." "Have I not held them in these hands many a time," said the Shepherd, "just as the scales were forming upon them? In fact, I have a hundred times rubbed off the newly-formed scales, and seen with my own eyes the marks of the parr, and no mistake about it." The Shepherd certainly shed some degree of light over the darkness which then prevailed, and down to his day has surrounded the salmon. Moreover, the Shepherd was patriotic in his views—he knew that thousands of the parr were annually captured to fill the frying-pans of Tweedside, and his plea was, "Spare these young ones; let us rather eat them in a year or two, when they have become of an age to afford sport to the angler and food to the people."

Another person who entered into the parr controversy with enthusiasm, but at the same time with more method than the Shepherd, was Mr. Shaw of Drumblugh, forerunner to the Duke of Buccleuch, Mr. Shaw being at that time backward in his method of manipulation, contented himself with privately gathering salmon eggs from the "redds" on which they had been deposited by the female fish, and placing them in an enclosed place saw that they produced parr; but on announcing his discovery and the method of it to some friends, he was told he had made a mistake, and that his fish were not true parr but young salmon. "They must be young salmon," he said, "seeing that you got them from the eggs of the female fish, and in due season were not to be driven from his purpose; and to make good his discovery he caught one day a few parr—it was on the 11th of July, 1832, that he did so—and kept them in a pond until they had changed into smolts, which they did between April and the middle of May, 1834. Yet in the face of such a fact Mr. Shaw and his "theory" were still discredited. To make sure of his ground, therefore, he repeated his experiments with a dozen parrs of larger growth, which he took from a salmon-stream (the Nith), and in due season the satisfaction of seeing them become smolts—the change from parr to more advanced stage of salmon life requiring a period of two years to accomplish.

On this very remarkable point of salmon biography Mr. Shaw met an opponent who traversed his views. Mr. Young of Invershing, gamekeeper to the Duke of Sutherland, had

also been experimenting on the young salmon, with a view to determine whether or not parr grew into smolt, and at what age the change from the first stage to the second took place. Mr. Young said the change took place in a period of twelve months, while Shaw maintained that two years elapsed before the parr assumed the scales of the smolt. Curiously enough, both in the sequel proved to be right; but the difficulty which had arisen was not settled till the salmon nursery of the river Tay was open in use for a period of two years last year, when he became thoroughly interested in the experiments he had undertaken, and excited by the opposition which was offered to his conclusions, buckled to his work in such a way as to astonish his opponents. His ultimate triumph was complete in its every detail. "I compelled my enemies to admit," he said, "that I had proved the parr to be the young of the salmon, and the salmon to be the parent of the parr."

It seemed the very irony of fate that Mr. Robert Buist—who had been in his day a commercial salmon-fisher in a large way of business, and who had hotly challenged and derided the Ettrick Shepherd's discovery that parr were the young of the salmon—should, as superintendent of the Tay fisheries, have to proclaim not only that parr were young salmon, but also that of each hatching a moiety became smolts at the end of one year, while the other moiety did not. The latter, which he imbibed with the migratory instinct till they had attained the age of two years, at this point of salmon growth may be held to have been finally settled by the operations conducted at Stormontfield, which began in the year 1853, and are still continuing. No one can explain this peculiar problem of parr life—how it comes that of two eggs deposited at the same time by the same fish, one becomes a smolt and seeks the salt water twelve months earlier than a fish born of the other egg! Various experiments have been tried and tried, and what proved an operation of nature has been arranged, but without avail. The young fish which seek the sea at the end of the first year are well mixed, there being a due proportion of males and females—the same holding good of the half of the brood which remain in the ponds. Nor has the size of the salmon from which supplies of ova and milt for artificial spawning are obtained anything to do with the solution of this remarkable problem. A 40-lb. female fish may provide the eggs and a 5-lb. grise the milt, without affecting the result. None of our fishery experts, nor any of the naturalists of the period, have been able to solve this remarkable riddle in natural history.

For the salmon's first entry in the time-table of its life there now exists reliable data; and to insure precision of statement, we shall enter the figures in their order, which is as follows:

Salmon eggs taken from the gravid fish, let us say from the 11th November 1862, till the 11th December of the same year, and fertilized with milt obtained in the same manner and at the same time from Tay salmon. These fish came to life in (first egg broke on the 12th) March 1863—the hatching process (it was an open winter) occupying about 115 days; in some years 120 days elapse before eggs hatched in the open air burst and the young salmon are released from their fragile prison. About 10th May, 1864, a first division of the crop of young fish (eggs of 1862) began to leave the Stormontfield ponds as smolts, and the migration continued till about the 25th of the same month.

At the date of their migration these young ones would be, say, fourteen months old.

The other moiety of the fish was left in the pond (or rather would have been left, had not the pond burst and the fish escaped into the river) for another year, and would not have come into smolt till the 15th of May—twenty-six months old, being at that time in the river Tay.

To this point the fish can be watched and traced—has been in reality watched and traced for a period of thirty years—with the utmost accuracy; and before speculating further on the salmon's tenure of existence, it may be permitted us to state that the parr cannot exist in salt water, nor can the eggs of the salmon be hatched in the sea, as has been sometimes alleged; both experiments have been tried and failed. On the other hand, smolts elude in their panoply of scales have been carried from the river Tay to Stonehaven in Kincardineshire, a distance of sixty miles; and upon being placed in a salt water pond at once took kindly to their new habitation, and rapidly became of greater size and weight. In about six months three of the smolts in question were seen, and by that time they had doubled their size.

Among the curiosities of parr may be mentioned the fact that specimens of these fish have been occasionally taken with their milt well developed. This circumstance was first noticed and tested by Mr. Shaw of Drumlanrig, who stated that with the milt of a parr—he it noted a fish about the size of a minnow—he had successfully fructified the eggs of a large salmon; and a similar experiment, with like result, was tried at Stormontfield. As regards female parr, none have been observed with their roe so developed as to give hope of their being able to perpetuate their kind; by far the greater portion of the females in their first year seem destitute of the most rudimentary signs of ova.

As may be supposed, the operations carried on at Stormontfield were taken advantage of to ascertain some facts as to the rate of growth of the fish. Various modes of marking the departing smolts were at different times adopted, so that, when any of them were caught, they might be recognized. Having some personal knowledge of what was done in this matter, and the smolts, and having more than once been present at the annual census of these fish, the writer claims to speak with some little authority upon this matter. First of all, let it be stated that the dangers to which the young fish are exposed are so manifold and regular in their occurrence, that it has been calculated by some fishery economists that not above one, or at the very most two, eggs in each thousand deposited by the female are hatched at maturity as fish. This is a statement, however, which must be accepted with a considerable degree of reserve. That a very large percentage of the eggs of all fish are never hatched we know; it is a fate, as will by and by be shown, incidental to the conditions under which the parent salmon and other fish deposit their ova; but to believe that only one or two out of each thousand eggs come to maturity as fish for the table, would imply such an enormous number of breeding salmon in the river Tay as to fill the river in addition to the grown stock. To provide the salmon stock of the Tay, for instance—from which stream it is necessary every season to take 70,000 to 80,000 salmon to pay rent of fishing stations and wages of fishermen, wear and tear of fishing-gear and interest of capital employed—would require a greater stock of "spawners" and "milkers" than its tributaries have apparently room to contain. It is impossible to make up a census

of the salmon population of the river Tay, but it is certain that at all periods of the year it must contain probably over a million fish of all ages, from the parr—of perhaps 100 to the pound weight—to the comparative giants of the water, which weigh from 25 to 40 lbs. In the months of April and May, for instance, there will be in the river at the same time parr about two months old, parr fourteen months old, and parr just changing into smolts, as two-year-olds. There will also be spring salmon, and probably a few grise, coming kind of all ages and dimensions, ascending and descending the river by day and by night; the capturing of marketable specimens for sale will be going on actively as well, so that the time-table of salmon life, as regards the Tay, or, indeed, any other stream, will be full of the most varied figures, if one could tabulate them with any degree of accuracy. The annual renewal of the Tay stock, if the estimate referred to were to be adopted, would require between 2,000 and 3,000 female salmon weighing 5 lbs. each, and each year would be required to produce 20,000 eggs; a similar body of male fish would be necessary—although, as a matter of fact, one male will suffice to spawn the eggs of several females—but, curiously enough, the sexes are far from being equal in number. If we take into account the fish stolen by poachers, the number of breeders indicated would be insufficient.

In consequence, then, of the mortality incidental to fish life, a very large number of any particular brood would require to be marked to insure one or two of the being recaptured either as grise or larger fish; therefore, when we say that on one occasion sixty-four smolts were marked by a particular cut in the dead fin, and that no less than five of these fish were afterward identified (in the course of about ten weeks), we believe we are stating that which pretty nearly amounts to an impossibility—namely, that seven per cent. of the smolts (70 per 1,000) return to their native water as well-grown fish, and that the value of the smolts recaptured is being that there would be more of the marked fish in the waters than those absolutely caught. If there were other five, that would represent the return of 140 per 1,000, which would detract from the value of all previous calculations as to the percentage of destruction. The smolts, when marked, would probably be about five inches in length, and of corresponding grise. The date of the marking operation was 24th May, 1862, in which of the smolts were recaptured from the ponds the periods of recapture being as follows:

Aug. 16.—A grise weighing 9 lbs. was reported as having been caught, and as having the mark made on it when it was a smolt.

Aug. 20.—Another of the marked fish taken as a grise, weighing 5 lbs. (Both of these fish were identified by Mr. Buist and Mr. Brown, who performed the operation of marking.)

Aug. 23.—Another marked fish taken which weighed 25 lbs.

Aug. 26.—A marked grise captured, but weight not given.

Sept. 19.—A grise of 7 lbs. taken, also bearing the pond mark.

The weights of the four fish given show an average growth of something like 6 lbs. as having taken place within say a hundred days. But, as the hatching of the grise, within a period indeed of eighty-four days, this rate of growth is, too, is wonderful when compared with that of the smolts placed in the salt-water pond at Stonehaven; these fish only doubled their size in six months, when they would be some nine inches long, and about twelve ounces or thereabouts in weight. Verily the quick rate of increase of size in the sea is marvellous as a fact in the natural history of the salmon; and the value of the striking change of circumstances, as regards the S. S. of the question, is also of the greatest importance; it means that, from being an article of almost no money value, smolts become in less than one hundred days fish worth eight or ten shillings each at the wholesale rate. It is not stated whether or not the 9-lb. grise contained roe or milt, which is to be regretted, because at the weight indicated the fish presumably would be seeking a place in which to deposit its eggs or to hatch, and to add to the curiosity of the situation, these fish might be able to spawn their eggs to be hatched, and the first moiety of the brood be going to the sea at the same time as their uncles and aunts! Founding on these facts, the time-tables of salmon life now stand as follows:

Of the same brood, one moiety has remained in the ponds from the date of hatching as parr, weighing probably an ounce, which, if we have gone on to the scales of the same fish, have gone off to the sea and have returned as grise of the average weight of 6 lbs.

That the markings of the smolts referred to were carefully made is certain, and that Mr. Brown, teacher, Perth, and Mr. Buist, superintendent of the River Tay Fisheries, thought the fish which they saw to be the fish marked at Stormontfield, there need be no hesitation in believing. These gentlemen acted throughout in good faith. Our own doubts arise, not so much from the mode of marking which was adopted—marking the dead fin, however, is not always convincing in the event of recapture when a reward is offered, seeing that the mark may be and has been imitated—but from the large percentage of fish retained—a number that previously would have been voted as purely imaginative, considering the destruction which takes place among the smolts when they reach the sea. Some naturalists have calculated that not above one to each five of the fish marked the smolts that descend from the upper waters of a river to the sea will return as living fish. At the mouths of all salmon rivers there awaits the annual advent of the smolts an army of enemies with keen appetites, so that the carnage which takes place is positively dreadful. Moreover, it has been surmised by one or two naturalists that half of the smolts remain in the sea for a year before seeking to return to the place of their birth. Of the sixty-four fish marked in the Tay, therefore, only half remained in the sea, and none at all fell victims to their enemies either going or coming, five, according to all showing, was an extraordinary number to recapture; and the fact being taken for granted, the question then arises, whether or not the rates of increase will continue—that is to say, will a fish, which adds 6 lbs. to its weight in a hundred days, attain a weight of 20 lbs. within a year? Should that be so, the 33-lb. fish of our imagination would not be much older than the two-year-olds of age, while its brothers and sisters might still have been parr.

Before going further, it may be as well to recur in more exact figures than has yet been done to the mortality which, during the earlier stages of its growth, attends the progress of the salmon. Assuming that a 25-lb. female fish of the salmon kind will, in the course of the season, instinctively deposit on the redds 20,000 ova, it becomes of great interest

to know how many of these will hatch and yield young salmon, and how many of these young salmon will live to multiply and replenish their kind. Of one hundred eggs deposited on the natural conditions of spawning, it may, we think, be assumed that not more than three will yield fish. The following figures may be accepted as being representative of the position. They are not, the reader may rest assured, taken at haphazard, but after much inquiry and thoughtful consideration of all the circumstances which attend natural spawning.

The eggs being voided by the female salmon in running water, a large percentage in consequence escape being fertilized by the milt of the male fish, which is also, of course, discharged in the running stream. The number of eggs in each hundred which escape fertilization may be stated at, say 52.

Of the fertilized ova, a large percentage is devoured by enemies of all kinds long before it has time to hatch: the number may be put at 15. Again, some eggs prove barren, others produce monstrosities, while a great number are washed into places where they cannot hatch, the heavy floods of the winter season so often break up the redds, on which the eggs have been deposited. Under this head, then, it will be a fair calculation to put down 20 eggs, making 87 in all, and leaving only 13 in each hundred to become in due time table-fish and breeders of the future.

It would be quite possible to present even a darker picture than this of the destruction of salmon ova. A common trout, for instance, has been captured with as many as 700 salmon eggs in its gullet. While the keeper of the ponds at Stormontfield one morning shot "a long-legged heron"—when it was dying the bird vomited fifty of the young salmon which it had been feeding upon. The perils of the parr have been thus related by Mr. Buist:

"When the young fish come to life and burst the shell, they lie in a helpless state for five or six weeks, during which water beetles, shrimps and other insects prey upon them unceasingly. After they get into a swimming state, they are devoured by fish of all kinds, and also by sea-gulls and other birds. In the next stage, as finely parrs, they are exposed to the ravages of pike, trout, eels, and even salmon themselves. From the stomach of a yellow trout I have seen not fewer than ten full-grown parr cut out—the specimens may be seen in the Perth Museum; and we have seen the stomachs of every one in a shoal of from forty to fifty pike, captured in the act of devouring them."

Taking note of the 120 fish per thousand, which are all that come to life out of that number of salmon eggs, it will be seen anon how they are disposed of; and the perils to which they are subjected from poachers will be recounted. But to the list of the more common evils which hinder the growth of our salmon—many of them, no doubt, the result of the various "pollutions" which are permitted to flow into our rivers—falls to be added a new horror. We are alluding to the outbreak of *suppuratio ferax*—a disease or growth of a fungoid kind, which in a brief period has played such havoc in the waters of the classic Tweed, as to have resulted in the destruction of over 14,000 fine fish of all sizes in the course of a season! Such a number of deaths in so short a period must prove a most potent factor in the destruction of the fish, and a large percentage of mortality must tend, for some years to come, to lower the average weight of the Tweed fish, and also to decrease the value of Tweed salmon both for table use and breeding. No solution of this new problem of salmon life has been yet arrived at, and in consequence no cure has been devised. A Royal Commission, which traveled the country to inquire into the causes of the outbreak, was unable to do more than take evidence—the Commissioners not being able to arrive at any definite conclusion as to a cause, far less to formulate a remedy. It has been actively asserted during the prevalence of the epidemic, that it is a result of the chemical manures which are washed off the adjacent lands in times of flood; but it must not be forgotten that a similar disease is said to have been known sixty years ago, when farmers did not use chemical manures. The cause could be no more than the kind of manure. There are some writers on the subject who believe the disease to result from the over-stocking of the water. But in the days when the Tweed yielded over 200,000 fish in the course of the season, there was no disease—at any rate the disease did not then become epidemic; yet now, when the Tweed is perhaps not yielding a fourth of that number of marketable salmon, and is at any rate presumably not half so populous with fish, the disease it once was, the disease has been much worse in that river than in any other salmon stream—more than half of the big fish in the Tweed having died this season (1881–82) from being attacked by the deadly fungoid growth. In some of the other salmon rivers of Scotland the disease has also proved most fatal.

That a considerable annual mortality exists at all times among the adult fish of all salmon streams we know, although the exact extent of it is seldom proclaimed. As a matter of fact, the salmon, from its cradle to its grave, is pursued with the greatest industry by a perfect horde of relentless enemies. But when all is said and done that can be said and done, and all the *pros* and *cons* of the salmon disease have been well discussed, it will probably be found that the severity of the attack is due to the impure condition of the water, or, at all events, is aggravated thereby. There is, we think, evidence that this is so—from the fact that the outbreak of *suppuratio ferax* has been most destructive in those waters which are most subject to pollution. In the river Tay the mortality from fungoid growth has only reached 2,000 fish—plenty, of course; but, considering the relative magnitude of the streams, far less than in the Tweed. Many opinions have been offered as to the cause and spread of this fungoid growth, but no two persons are agreed upon the matter. In the columns of our local newspapers, correspondence is found on the subject, and battles about the disease are being fought, but it would serve no good purpose to dissect the numerous theories which have been started on the subject. As a step towards a remedy, let us first of all have the purest of pure water, instead of water thick as sirup, with "matter in the wrong place." When salmon find themselves in a clean, clear-flowing stream, disease of all kinds will assuredly disappear, or at all events greatly abate in its intensity. In the mean time, the fact that the fish in the river Tweed should have been made to lose, in all probability, about a third of their capital stock of fish from this loathsome disease.

[TO BE CONCLUDED.]

Two quail hunters in California recently discovered a vein of coal which is said to equal the best Pennsylvania anthracite.

# TROUT IN PENNSYLVANIA.

A VERY enthusiastic trout fisherman, resident of the Lehigh Valley, who is thoroughly posted in reference to the state of the streams in that section of the State of Pennsylvania, writes as follows: "There have been a few trout caught with bait in the dams and deep holes, but very few with fly. Some parties were out on the 1st (Sunday) and took a nice lot out of the dam where we had such fine sport a year or two ago, and I heard of another lot being caught on Monday or Tuesday following at the same place, but they are not catching any in the streams yet. I ran out on Thursday, the finest looking day we have had, and only took about a dozen small ones. I did not go up to the dam resort, but to the stream below. Parties who had been there reported they had been run off, and as there was at least a dozen of them who came straight down stream in pairs and threes, I concluded the fellow who lives there must be mad enough to curse his grandmother, so I started away. All of them I met were worm fishermen, some had one trout, some two, and some not so many. I tried bait at first but could not do anything with it, then tried every fly in my book with no better success, became disgusted and started for home. I should have known better than to go out, but it was a bright sunny day, and as there had been some light catches reported earlier, concluded to try it. I am satisfied there is no use fishing until the snow water is done running that is in the main stream.

"It is all right if you can strike them in a pool or dam where they have laid all winter, but when the north sides of the hills are covered with snow two or three feet deep they don't move out of winter quarters much. When I left this creek at one place I waded through snow half leg deep. The idea of trying to fool an old trout that has spent more than one winter in the stream with a 'hand-made fly,' when the ground above him is covered with snow and the air and water cold enough to freeze a fly stiff in a minute, is rather thin. He may come up and look at the fly if you put it on the water just right well over it, like a porpoise, and sink like a stone to be seen no more until warmer weather. One of the dozen I caught not more than half of them were hooked in the mouth. Some were hooked near the eye on the outside and some at the other end. The only good fight I had was with one hooked near the vent. He fought bravely and renounced me of old times when we used to take them weighing from a pound to two and a quarter. The creeks nearest the railroads are all fished to death. The first few warm days of the season, when you and your friend come up, we will drive back in the country for about five miles."

From the above letter a fair estimate can be made of the condition of all the trout streams in the State and not merely those of the Lehigh Valley section. We are very late this year.

APRIL 12, 1883.

Hoxo.

## WHAT IS A GAME FISH?

THIS moment question has been decided by the Attorney-General of the State of Illinois, in reply to one of the Commissioners of Fisheries of that State, as follows:

ATTORNEY-GENERAL'S OFFICE, STATE OF ILLINOIS,

Chicago, March 31, 1883.  
Hon. S. P. Bartlett, Secretary Board of Fish Commissioners:  
DEAR SIR—I am in receipt of your communication asking:

1. What is the meaning of the words "game fish," as used in Section 1 of an act approved May 13, 1879, Laws of 1879, page 108?

2. What degree of circumstantial evidence is necessary to justify the Commissioners in causing arrests for the violation of the law in relation to fish? Is possession in quantities of such fish, without evidence of any other circumstances, hook and line, sufficient to justify the arrest of the possessor?

3. Is any notice necessary to require fishways to be built in accordance with the law of March 9, 1879?

Permit me to say, in reply:

First—The words "game fish" include any and all fish commonly used and suitable for food, whether belonging to any of the species named in said Section 1 of the act of May 13, 1879, or not.

Second—Any evidence or circumstance which would cause a reasonable man to believe that the law had been violated, would be sufficient to justify an arrest. Possession of fish (within the time prohibited by law), with any attendant circumstances to indicate that they had been caught in a manner prohibited by law, such as possession of them in large quantities without evidence of having been caught by hook and line, and at the same time possession of a seine, net, or having the appearance of recent use of any other circumstance, indicating that they were caught unlawfully, would be sufficient to cause an arrest, and proof of these circumstances, without any rebutting circumstances or evidence in explanation, would be sufficient to sustain a conviction.

Third—No notice to build fishways is required, and all persons own fishing dams or other obstructions without the proper fishway as required by law, are liable to fine, whether any notice has been served or not.

Very respectfully,

JAMES MCCARTNEY,  
Attorney-General.

## OHIO FISH LAWS.

THE new law relating to fishing in Lake Erie, which has just passed the Ohio Legislature, seems to us to be designed to prevent all bass fishing. The clause relating to the time prohibited by law, with any attendant circumstances, prohibiting fishing of any kind at any time, is the favorite bass ground, and we do not understand why the fishing is to be prohibited there. We give the law entire: A bill to amend section 6,968 of the Revised Statutes of Ohio, as amended April 20, 1881.

SECTION 1. Be it enacted by the General Assembly of the State of Ohio, That section 6,968 of the Revised Statutes of Ohio, as amended April 20, 1881, be amended so as to read as follows:

Sec. 6,968. Whoever, in any body of water, whether natural or artificial, lying in the State of Ohio, except in private fishing waters, in Lake Erie, Mercer county reservoir, and the Licking county reservoir, catch in any way other than by a hook and line, any fish, except minnows, shall be guilty of a misdemeanor, and shall, on conviction, be punished as hereinafter provided. Whoever draws, sets, places or locates any seine, net, gill net, trap or any fish net or device for catching fish, except for minnows or catches, except with hook and line, any fish except minnows, aforesaid, in any of the inland waters of the State of Ohio, or the waters of Lake Erie, west of Avon Point, from the 1st day of June to the 1st day of October of each year, or in the waters of Lake Erie, east of Avon Point, from the 10th day of June to the 10th day of October, shall be guilty of a misdemeanor and shall, on conviction, be punished as hereinafter provided.

Whoever shall, at any time of the year, in Lake Erie, in the vicinity of the islands thereof, and in the bays tributary thereto, upon the shores and reefs therein, by means of any device whatever, fish for or catch any fish, shall be guilty of a misdemeanor, and, on conviction, punished as provided hereinafter. Whoever buys, sells or offers for sale any fish caught out of season or in any manner prohibited by this act, shall be guilty of a misdemeanor, and, on conviction, punished as herein provided; Provided, that nothing in this section or the several statements of offenses herein contained shall prevent the fish commissioners of this State, or their agents, from taking fish at any time or place for stocking ponds, lakes and rivers, and for the maintenance and cultivating fish artificially, and for no other purpose; and provided further, it is hereby made the duty of said fish commissioners, on complaint of any person or otherwise, to prosecute all violations of this section, and any person may make complaint of any violation of this section before any justice of the peace, having jurisdiction of the same. And whoever shall violate any of the several provisions herein contained shall, for each and every such offense, be fined not more than \$100 and not less than \$1, or imprisoned not more than sixty days, or both, at the discretion of the court; that nothing in this section shall prevent the catching of suckers and mullets in any manner between the 20th day of March and the 20th day of April in each year.

Sec. 2. That said section 6,968, as amended April 20, 1881, be and the same is hereby repealed, and this act shall take effect and be in force from and after its passage.

## DOES THE MASKALONCE LEAP?

THE picture of a leaping maskalonce, by the late S. A. Kilbourne, in the "Game Fishes of the United States," has raised this question among anglers. We have heard it discussed in the tackle stores, and now our old friend, Hon. Ellis Phinney, chairman of the fish committee of Otsego county, N. Y., sends us the following:

In company with the late Hon. George B. Warren, of Troy, N. Y., a life-long angler and one of the greatest men known to our ilk, it was my good fortune for several successive summers, long years ago, to troll the pleasant Canadian waters for maskalonce. His own original and favorite water was Rice Lake, where he once captured in a single day, with two rods, twenty-one fish, averaging over ten pounds each. Since that time poaching, spearing, netting and dredging have brought them to the fish market, and any such record would now be impossible. To the great credit of the Canadian authorities, however, a most determined effort is now being made to restore to that water its former prestige.

Our joint excursions were generally made to Pigeon Lake and its tributaries, where, during the month of June, we had always capital sport, its average catch being about one hundred pounds per day, instead of mine (I being then a tyro) about seventy pounds. His largest fish was twenty-four pounds, mine twenty-one and a quarter. The general average was about eight pounds. In other words, the daily catch was from eighteen to twenty-five fish, and we must have taken in all from this single water more than five hundred maskalonce, and of all this large number I do not hesitate to state positively that more than one-half, possibly more than two-thirds, threw themselves the instant they were hooked, either entirely or partly out of water. Times without number have I seen them do this. They were quite as likely to do it as the small-mouthed black bass, and nothing has surprised me more than to hear the question so seriously discussed as it has since been.

On one occasion in particular, I remember trolling in Pigeon Lake, near some dead timber, over likely ground, but against a heavy sea, the curmsan pulling at his best, when suddenly the boat was actually brought to a standstill by a tremendous strike. The next instant my best rod snapped in the middle. I turned just in time to desecr the monster who had caused the mischief wholly out of water, flashing in the sunshine, with my yellow spoon and his feather dangling from his gills. A second later and he was gone with all my tackle. This splendid fish I was obliged to weigh at the end of one hundred feet of line, in a gate of wind, on a very rough water and under excitement, but as nearly as I can recall the figures, he tipped the scale at exactly twenty-nine pounds, fifteen and three-quarter ounces.

On one point my memory is absolutely perfect, and that is that, although a married man of more than thirty years standing, I had still remaining on my pate a few straggling hairs, every one of which was electrified and stood straight out for twenty-four hours after the stirring incident above mentioned.

In regard to the weight of the big fish, viz., twenty-nine pounds, fifteen and three-quarter ounces, it would have been easy to add the other quarter of an ounce, and so made it an even thirty pounds. But no reputable angler would be willing to sacrifice himself on one quarter of an ounce of fish. I have, therefore, adhered scrupulously to the scales.

ELLIS PHINNEY,  
Chairman Fish Committee.

COOPERSTOWN, April 10.

HARTFORD NOTES—Hartford, Conn., April 13.—Trout fishing has been very poor thus far, the cool wave still hangs on, and the "specked beauties" do not seize the festive worm with that snap the angler could wish. A few snipe have been shot here the past week; we do not have but a few days shooting on them in the spring. The Connecticut River is very high and the water is running fast, having their fun now. Where are the red-headed woodpeckers? One year ago the woods were full of them, and I learn of as many as four having been shot by two persons in one day, who killed them for eating—they must have been a rich morsel. I should as quick think of eating house flies. We have a sportsman here who claims that fox steak is a very fine dish. He can have my fox every time.—FLICK FLICK.

ROCKFISH IN THE DELAWARE.—There is a great complaint of the scarcity of rockfish in the Delaware River. It is getting more noticeable every year. Old fishermen say if the big thirty-pounders caught in the seines were put back in the stream where they were taken, instead of being marketed and sold for two to three dollars each, a difference would be shortly seen. The Anglers' Association of Philadelphia is agitating the question of appointing a fish warden for Schuylkill River, and propose the prohibition of the use of all nets. It is said that the visible decrease of the black bass between Fairmount and Manyunk is caused by set and fyke nets. The dye stuff has more to do with it than anything else.—Hoxo.

ROUTE TO THE NEPIGON.—In answer to "Angler's" question in your impression of April 5, I beg to inform him that I made an expedition to Nepigon from the Indian Territory in '81. I found from inquiry that the only convenient route was to go to Chicago, to take steamer thence to Sault Ste. Marie, and to re-embark on a Canadian steamer from that point to Red Rock, Nepigon. Time from Chicago to Sault Ste. Marie two or three days; time from Sault Ste. Marie to Red Rock also two or three days, but in both parts of the journey the steamers are very liable to defection from fog, wind and the number and length of stoppages they may make on the way. The difficulty in reaching Nepigon for a man who is pressed for time lies in catching the Canadian boat bound for Red Rock at Sault Ste. Marie. The headquarters of the Canadian lines are at Sarnia and Collingwood, and by writing to the agents there your correspondent can find out the dates of the arrival at Sault Ste. Marie of those of their steamers that are bound for Red Rock. Your correspondent will get good fishing at "the First Long Portage," about fourteen miles above Red Rock, but not lower down. The fishing gets better the further up you go, but it is quite good enough at the place just mentioned. The portage is two or three miles long and there is abundance of good pools on the part of the river alongside. This portage is a good place to camp, and you can send up your outfit and provisions in a large sailing boat to that point, but no further.—AN ANGLER.

I am much obliged to "Fishman" for his full and explicit answer to my question as to the shortest time route to Nepigon in the FOREST AND STREAM. Will he allow me to ask another? Is there regular steamer connection between Duluth or Superior and Red Rock; and if business carried one to St. Paul, would not that be a good route to take? And still another. The time part of the question is important. If it should rule out Nepigon, can good trout fishing still be had in the August in the State of Maine? Or, at any point which one could take in a day, in a day, en route to Boston with from three to four weeks at command?—ANGLER.

BASS ISLANDS ON LAKE ONTARIO.—Avon Springs, N. Y.—Speaking of angling resorts, lower Lake Ontario and the islands and shoals around it are famous, but of late bass in immense shoals seem to have covered the reefs and shores of the great islands on the American shore. Last summer it was no unusual trip to catch fifty of the most gamey bass and more if desired. Stony Island, and a group of islands surrounding it, and the mainland of Stony Point, were alive with fish on the flat rocks and gravel banks. Other fish are innumerable, and at proper seasons the fishing for pike by moonlight has been a great sport, and resulting in a boatload in a night. Taken by trolling hooks, Henderson Harbor is near all these points, and Lakeside Farms House, kept by O. N. Rogers & Co., Henderson, N. Y., is a very delightful landing on the bay, with board from \$5 to \$10 a week. These farms have a large dairy and afford a very pleasant and reasonable (in price) stopping place. I consider the location the most picturesque of the whole Thousand Islands section. Prof. Appleton, the noted biologist, has a large place opposite Lakeside, and is one of the most successful fishermen I ever have known.—R.

MINNESOTA FISHING.—I am surprised that the game qualities of the wall-eyed pike have ever been questioned. In Minnesota, I understand they are much neglected fish, fully the equal of the bass both in game and table excellences. During the months of June and October they are free biters, preferring live minnows or grub-worms, and yield as much sport to the pound as any fish I ever handled, not even excepting the trout. In all the lakes hereabouts they often attain a weight of eight and ten pounds, and their first rush upon feeling the steel awakens r minds me of the trout in Wisconsin Lake trout. In Long Lake, three miles from this village, I caught in one night, in one summer, forty pike, averaging five and one-half pounds each, or a total of 220 pounds. That was an exceptional day's sport, however, the "conditions" being wonderfully favorable. If any one doubts this statement "being all wool and a yard wide," I can show them the hole from whence the fish came, and a pile of bones in the rear of where my tent stood. I will also gladly act as guide and companion, to any one who may and true, who would a surprise of pike, bass or pickerel fishing.—J. FRANK LOCKE, (Pillsbury, Minn.)

COLORADO FISHING.—Rico, Col.—Your request in relation to fine trout fishing points has attracted my attention. To get as fine trout fishing as can be found in Colorado, and a view of some of our grandest scenery, the sportsman will take the Denver & Rio Grande Railroad for Rockwood on his way to Denver. A line of fine leaves Rockwood every morning for this point, from here parties can get transportation to Springfield in the West Dolores River (a new mining camp), where trout are in more than abundance. Fifteen miles will be the distance from here. Fish Lake, a large body of water, nine thousand feet elevation, is teeming with brook and salmon trout. The people are very hospitable, and parties will find prices moderate. Everyone must put up their own horse, as our country is so Game in abundance, bear, deer, grouse and rabbits. Scenery unsurpassed. I will spend a part of the season at each of the above places, and any information desired I will cheerfully give.—W. P. COTTER.

THE FISHERMAN'S PAPER.—There is in all the United States but one paper devoted entirely to fishermen and their interests. In the length and breadth of the land there are multitudes of papers devoted to special pleasures and pursuits, such as the *Railroad Journal*, the *Whelan*, the *Paper* for bicyclists, etc.; and with all our fishing interest it is not strange that a paper should cater for the fishermen. Gloucester, Mass., is the center of the fishing interest of America; every man, woman and child there lives, either directly or indirectly, from the fisheries. Those who do not fish make boats, sails, casks and other necessities for those who do, while others sell the fishermen points for their boots, clothing, and the like, and the United States Fish Commission. The Cape Ann *Advertiser* gives the fisherman his news, and reports his success or failure, and is the only fisherman's paper in the country. It is well edited and is a reliable and readable paper.

A RIVER MONSTER.—We have received an account of a terrible monster captured in the Tennessee River at Paducah, Ky., by a Canadian fisherman who rejoices in the name of Loof Lipra. We have read the account carefully, and have no doubt of its authenticity, especially since we have analyzed the fisherman's name and spelled it backward.

four months but two of these dogs, while at the latter place they were abundant. At Aix the Ulm dog was the favorite, and magnificent dogs they are. Another German friend, Mr. C. Lieck, says, "the points of our conversation, rather surprising me at the beginning of this noble species, by the intelligence that in Germany there were but three kinds of canines, known as "doggen," viz: the mastiff, the Ulmer and the Danish; all the other varieties are "hundes." At Mr. Lieck's dictation I wrote:

**General Appearance.**—The Ulmer has not the heavy appearance of the mastiff, neither the slender form of the hound, but between the two it holds a middle; with great head, carried high, strong but elegant figure, long stride and proud bearing, the tail generally hanging, but when under excitement at horizontal. The points of the good dog are—

**Head.**—Moderately long with high frontal and somewhat compressed at sides, then broader and flat over the eyes, the forehead in profile being but little higher than top of nose, rising at rear from front view; the nose and jaws strongly built, the bridge of the former being slightly concave; the upper lips hang slightly over lower jaw, with marked wrinkles at corner of mouth; under jaw neither protruding nor receding.

**Eyes.**—Small and round, with sharp expression, with well-developed eyebrows.

**Ears.**—Set high, and when clipped, as is the custom, standing upright, unclipped they droop.

**Neck.**—Long, vigorous and lightly curved; broad at breast.

**Chest.**—Broad, arched and deep.

**Back.**—Long and rounded, croup short, moderately sloping to the tail root.

**Tail.**—Broad and strong at root, tapering, not long, seldom reaching beyond the "sprunggelenk" (which I made out to be the muscles of ham just above knee).

**Belly.**—Well drawn up at rear.

**Limbs.**—Fore: Shoulders slanting, upper parts very muscular, running slightly outward at knees. Hind: very muscular ham, lower leg long and strong with angle similar to greyhound's.

**Feet.**—Rounded and pointing straight ahead, toes well rounded, claws strong and curved.

**Uti.**—Short, thin and thickly set.

**Colors.**—There are three marked varieties which are given precedence in value, thus:

1. The "gedammte," ground color, golden brown, yellow or gray, with dark flame-shaped splashes, nose, eyes and claws black.

2. The "one-colored," yellow, slate to ash gray, or white with light gray at snout, around eyes and along spine; eyes, nose and claws dark.

3. The "spotted or tiger dog," ground color, white or silver gray, with irregular shaped dark spots, eyes "glassy," nose and nails sometimes flesh-colored.

**Points.**—Forehead too much compressed, or in the profile too high, deep set, broad or hanging ears; short, plump throat too narrow chest, concave back, rounded croup with deep set tail, too narrow or too wide standing forelegs, or curves in the same; protruding knees, feet turned either way, white feet on the dark colored dogs, broad, spreading teeth; curved tail, color like a fox, flesh-colored noses on any except the tiger dogs. Some of these Ulmers are as large as the largest bloodhound.

The pelicula dogs of Europe, especially of Austria, Belgium and Germany, however, greatly they may differ in breed and style, have one strong point in common, for nearly all are well broken to harness, and perform for the agriculturist in the country, and for all sorts of trades in the city, the labor elsewhere demanded of horses and mules. The teams range from one dog to four, and once I saw six, four ahead and two under the wagon. Three is a very common number, the middle one being in shafts, the two outer in traces.

In Germany they are generally hitched ahead of the wagon, tied in Belgium to the rear axle and run under the vehicle.

The dogs of milk carts, garbage collectors and fish peddlers are so well trained that they could go their rounds undriven. In Aix it is quite common to see a cart consisting of a long pair of skids resting on the axle, and between the two dozen kegs of beer. Baggage is carried to and from the station by them, and one in Vienna with but slight aid on up-grades from the dienstmann, drew my baggage over one hundred kilograms, to the hotel.

Many of them are fearfully overworked, and lie down panting at every stoppage, but when at work pull for all of their weight. They are not shod in any way, and many of them soon wear out, their feet cracking and tearing. I have seen but one case where these animals have been used by any but the lower classes in laborers. There is here in Antwerp a crippled gentleman, who has a noble team of four large dogs, of which he uses two or all four, as he sees fit, for carriage dogs, having a very natty landau just big enough for one.

Antwerp, Belgium, Nov. 25, 1882.

## THE NEW YORK BENCH SHOW.

**FOLLOWING** is a complete list of judges for the New York bench show, which closes to-morrow.

For Irish setters and black and tan setters—Jno. C. Higgins, Esq., Delaware City, Del.

For English setters and pointers—Maj. J. M. Taylor, Lexington, Ky.

For spaniels and small non-sporting dogs—J. F. Kirk, Esq., Toronto, Canada.

For mastiffs, St. Bernards, berghunde and other large non-sporting dogs—James Watson, Esq., New York City.

For collies and beagles—Dr. J. W. Downey, New Market, Frederick county, Md.

### SPECIAL PRIZE LIST.

The Eastern Fairs Trial Club offer the following prizes for dogs that have run and been placed in any of the field trials that have been held in America:

A.—For the best pointer bitch, a club medal suitably engraved.

B.—For the best pointer bitch, a club medal suitably engraved.

C.—For the best English setter bitch, a club medal suitably engraved.

D.—For the best English setter bitch, a club medal suitably engraved.

E.—For the best Irish setter bitch, a club medal suitably engraved.

F.—For the best black and tan setter, a club medal suitably engraved.

The Westminster Kennel Club offer the following prizes:

H.—For the best kennel of large-sized pointers, to consist of not less than five owned by exhibitor, a club medal suitably engraved.

I.—For the best kennel of small-sized pointers, to consist of

not less than five owned by exhibitor, a club medal suitably engraved.

J.—For the best kennel of English setters, to consist of not less than five owned by exhibitor, a club medal suitably engraved.

K.—For the best kennel of Irish setters, to consist of not less than five owned by the exhibitor, a club medal suitably engraved.

L.—For the best kennel of black and tan setters, to consist of not less than five owned by exhibitor, a club medal suitably engraved.

A gentleman sportsman offers a special prize of \$25 for the best English setter dog or bitch.

N.—George C. Sterling, Esq., of New York, offers a pair of imported baccharis vases, value \$25, for the best English setter dog in the open class.

O.—The U. S. Cartridge Company, of New York, offers \$20 cash for the best English setter puppy.

P.—The Messrs. Bruce offer as special prize one year's subscription for the best black and tan setter.

Q.—A member of the Westminster Kennel Club offers \$20 cash for the best black and tan setter puppy.

R.—A member of the Westminster Kennel Club offers \$15 cash for the best pointer dog, to be the get of Sensation.

S.—A member of the Westminster Kennel Club offers \$10 cash for the best black and tan setter dog or bitch.

T.—A member of the Westminster Kennel Club offers \$20 cash for the best pointer dog puppy.

U.—A member of the Westminster Kennel Club offers \$20 cash for the best pointer bitch puppy.

V.—A member of the Westminster Kennel Club offers \$20 cash for the best Irish setter puppy.

W.—A member of the Westminster Kennel Club offers \$20 cash for the best large-sized caniche poode.

X.—Messrs. Remington, Sons offer a special prize of a brace of pistols in the successful get of the best greyhound.

Y.—Messrs. L. & W. Rutherford offer \$25 for the best fox-terrier dog, got by one of their stud dogs, or bred in their kennels. Also \$25 for the best bitch, same terms and conditions. Donors do not expect.

Z.—The Westminster Kennel Club offers \$25 cash for best pug, dog or bitch, entered in the open classes.

AA.—The Westminster Kennel Club offers \$10 cash for best collie dog, got by one of their stud dogs, champion, March or champion, Tweed II, of the Westminster Kennel Club.

BB.—A friend of the Westminster Kennel Club offers \$25 cash for the best mastiff dog or bitch.

CC.—A friend of the Westminster Kennel Club offers \$25 cash for the best foxhound bred in this country.

DD.—The U. S. Cartridge Company, of Lowell, Mass., offer 500 of their new water-proof shot shells for the best English setter dog or bitch in the show.

EE.—Thomas H. Terry, Esq., offers \$10 cash for the best collie dog got by one of his stud dogs, champion, March or champion, Tweed II, of the Westminster Kennel Club. Same terms and conditions. Donor does not compete.

FF.—A friend of Irish setters, offers \$25 for the best brace (dog and bitch) of Irish setters, owned by the same person.

GG.—J. G. Hecksher, Esq., offers gold medal for best Chesapeake Bay dog or bitch.

HH.—J. G. Hecksher, Esq., offers gold medal for the best caniche poode.

No entries are required to be made for the special prizes that are offered as above, except classes A to L, but it is necessary that all dogs, to enable them to compete for the special prizes, must be enumerated in the premium list issued by the Westminster Kennel Club.

The award of the special prizes will govern the awards in the special classes as far as practicable without any judging. Entries close April 23. CHAS. LINCOLN, Sept.

## PRE-NATAL INFLUENCE.

ONE of our correspondents writes us: "Allen, in his book on American cattle, refers to the dog, and says, 'With regard to the dog, it has often been observed, and indeed it seems to be a matter of notoriety, that a well-bred bitch, if she has been impregnated with one of her own kind, will produce subsequently by a pure dog, bear thoroughbred puppies ever after, or at least in the next two or three litters. And it appears, further, that the progeny are affected in respect, not merely of their shape and color, but of their natural instinct also.' Is this a fact?"

Our experience in breeding dogs during the past thirty years has been quite extensive, and we have had several "accidents" of the above kind in our kennel, and our attention has often been called to them in the records we have yet to see an instance that would lead us to believe that the above is true. This, of course, is only negative evidence, and as well-known writers maintain the contrary, we are inclined to think that it is at least somewhat true, and should never feel quite sure about breeding a bitch that had previously had offspring by a cur. Our attention was first called to it in subject many years ago by reading an article in the *Scientific American*, entitled, "The Theory of Widdowood." Some cases were given, among them that of the mare and the quagga, to be presently quoted.

It has also been stated that the use of jacks in the State of Maine had so affected the mares that the horses bred there were called "jack-horses."

In the fourth edition of the "Handbook of Physiology," by Drs. Kirke and Paget, published in London, 1850, we find the following reference to this subject: "Nothing has shown what a powerful influence the male has in the case of a mare, or which is yet more remarkable, of the female, in the development of the characters in features, size, mental disposition and liability to disease which belong to the father. This is a fact wholly inexplicable, and is, perhaps, exceeded in strangeness by none but those which show that the seminal fluid either directly, or more probably through the medium of the mother, may exert such an influence not only on the ovum which it impregnates, but on many which are subsequently fertilized by other males."

"It has often been observed, for example, that a well-bred bitch, if she has once been impregnated by a mongrel dog, will not bear thoroughbred puppies for the next two or three litters after that succeeding the copulation with the mongrel. The best instance of the kind was in the case of a mare belonging to Lord Monson, who, while he was in India, and wished to obtain a cross-breed between the horse and the quagga, caused this mare to be covered by a male quagga. The male quagga was killed and the foal was born in the shape of its head, black bars on its legs and shoulders and other characters. After this time she was thrice covered by horses; and every time the foal she bore had still distinct though depressing marks of the quagga, the peculiar characters of the head and legs, and the color of the coat. The ovum then impregnated, but on the three following ova impregnated by horses. Of the various theories which have been advanced in explanation of this singular fact of which many parallel cases are recorded, the most plausible is that suggested by those recently promulgated by Dr. Alexander Harvey, according to which the constitution of an impregnated female becomes so altered and tainted with the peculiarities of the impregnating male through the medium of the fetus, that she necessarily imparts the peculiarities to any offspring she may subsequently bear by other males."

Should our correspondent care to investigate further he will find Dr. Harvey's articles which are entitled "On the Fetus in Utero as Influenced by the Maternal System," and "On the Fetus in Utero as Influenced by the Paternal System," in the *Parent as Influencing the Nutrition and Development of the Offspring*, can be found in the *Monthly Journal of Medical Science* for 1849 and 1850, and in the *Journal of Cross Breeding* in No. CXCLX of the same periodical, which is then called the "London and Edinburgh Medical Journal."

## BENCH SHOWS AND JUDGING.

*Editor Forest and Stream:*

A sincere desire to see an improvement in all breeds of dogs prompts me to enter the lists, and break a lance in behalf of bench shows and judging generally, and particularly in behalf of that of some of the classes in the recent exhibition at Washington. I don't think some of the many exhibitors there can be fully aware of the purposes for which bench shows were created, and are held, or they would not be so eager to play at "cut and thrust" with their pens.

The much-maligned judge, in the defense at my hands, and perhaps will not blame me for my tilt in the melee of the tournament.

But having great faith in the results accruing from well-conducted canine competitions and critical judgment, I want to say a few words about them, and about good dogs and their masters, for I don't care a penny who owns them, be prince or peasant, and the recent judging especially. This is my excuse for the intrusion of this letter. Since the prizes were awarded at the nation's capital, have been named to read the growls with which the papers have been so richly freighted by several competitors, because their favorites were not crowned with laurels of victory.

I detest "squealing," except when it can be proven that the judge is grossly corrupt and grossly mistaken. The let the growls be gruff and trumpet-tongued! Otherwise "squealing" is unmanly, unsportsmanlike, and ungenerous. The decisions of one of the judges at Washington are harshly criticised by some of the judges at the recent exhibition, English setter and English classes. One competitor, Captain Jones, is so ungenerously enough to call one of these decisions "infamous." Pretty hard language, Captain, and in some quarters it might be dangerous to use it. Now, let us look at facts. A greyhound, which had at some previous period taken a shower, was presented with a broken leg before the judge. This gentleman, having had an experience of over twenty years in judging dogs of various breeds in England, Ireland, and Scotland, having made it a study, as men pursue sciences—and knowing the value of four good sound legs to a greyhound of all other dogs, and that without the free use of all four he cannot be a conqueror in the coursing field, very naturally, and justly, it seems to me, decided against the poor maimed animal, and was not prepared to take any more of it. I don't think that was sound of limb, and consequently able to run fast. For this he is taken to task, in a manner that seems to me entirely unjust, and to say the least, unsportsmanlike. Of course, a greyhound, which is lame, is not a good dog, and I look to immediate utility in our bench shows, and not merely that which looks graceful in repose. No greyhound should ever be exhibited on the bench that is not in fit condition to run a course.

We are supposed to take recruits for an army of usefulness and mobilization from "the blind, the lame and the halt," when stout, strapping fellows are waiting without to enlist, and the enemy is thundering at the gates! Dogs should be in perfect condition as well as in use, as possible, ready for service, the greyhound ready to run, light in flesh, ready in muscle, sound in limb; the setter and the pointer likewise, fit to follow the gun, and so the foxhound, ready to obey the music of the horn, and the bull-terrier and the fox-terrier, "light-strung" for the fray in their chosen arena. A dog, must be prepared for use, as well as for parade. Is a dog—a greyhound especially, of all others—in good condition and fitted for fun when one leg is injured so as to retard the perfect locomotion? And if so, why should we expect to assign that she should have been given a prize at the Washington show simply because some other judge had awarded her one on a former occasion? That seems to me, with all due respect to the fault-finder, an absurd method of arriving at a decision. Judge a dog on his merits, and not on his greyhounds, and therefore incompetent. Or his fellow competitors may have been a measly, wretched lot.

Judge No. 2 has made the judging of dogs a specialty for years, and has never been beaten. He has a special knowledge, and has bred greyhounds by the score. Has the owner of this greyhound bitch, who accuses the judge at Washington of "venting his spleen" on his dogs, ever trained his favorites for a courser's match, or "assisted" at these exciting contests of speed, skill and endurance? Has he ever been in California? If he has, then there must be know that the flying beauties who carry their colors to the front are not as straight in the stiles as is his bitch, otherwise they could not be counted on to have won the prize. He has a special knowledge, and has bred greyhounds by the score. Has the owner of this greyhound bitch, who accuses the judge at Washington of "venting his spleen" on his dogs, ever trained his favorites for a courser's match, or "assisted" at these exciting contests of speed, skill and endurance? Has he ever been in California? been trained and educated to the sound of the gong, in the same manner as the horses of the fire department. The harness is also rigged over the shafts in the same way to allow of them being dropped upon him instantly.

It took but a short time to teach Tom what was required of him, and he is now always ready to play his part, waiting patiently till the word "ready," and then he is off like a shot and there is no such thing as stopping him. The following will illustrate how well he understands his work:

On Sunday afternoon Tom was having a good time with the boys in front of Number One's house on St. Clair street, and after being shown around on the inside of the room he stepped out the door again. Some of the men, to see what the horse would do, struck the gong. Now Tom had heretofore heard that horses were afraid of the gong, and he was naturally thinking this no exception to the rule, he turned and pointed constantly and looked for a moment or two over the heads of the crowd around the door at the engine to see where his place was. Then, as if a thought had struck him, he turned again and, with a yell, ran off on a dead run up the line, and around to the stable, with the boys following him, shouting actions. When they reached the barn he was found backed around into the shafts and all ready to start. He looked at the boys for a time, as much as to say, "Well! Here I am all alone!" "What are you waiting for," and then seeing no disposition to start, he turned back, and, with a yell, ran back, he walked out of the stable, and was ready to start again. The boys tried the same thing over again, but he only pricked up his ears, listened for a moment and would not stir. He was "onto" their tricks, and once was all he could be. The next evening, when the boys were out, the most intelligent horse ever saw, have owned many magnificent horses, but Old Tom beats them all.—*Cleveland Herald.*

## POT LUCK FROM EXCHANGES.

The proprietors of Gardiner's Island object to the building of a wharf there for fear that rats would leave vessels that would probably tie up to it and find lodgment on the island. At the present time there is not a rat on the whole island.

The Charlottesville (Va.) *Chronicle* says that a turkey with thirteen legs, three heads, and two gizzards, came into possession of a minister in Charlottesville. Such a monstrosity is preferable to a donation party anyhow, although its capacity for eating and tearing up things is about the same.

Mr. Venator tells us that a young brother of his recently caught a full-grown swan in a steel trap. The wings of the bird were clipped and it was kept a few days with some tame geese, and has now become so tame that it feeds with the barnyard fowls, and shows no disposition to return to its old haunts.—*Modoc Independent.*

While Senator Beck was gazing into the clear water at Glen Cove Springs, Florida, the other day, his gold-framed eyeglasses slipped off, and as he watched them sinking he saw a huge catfish open his jaws and swallow them. As these were the same glasses, adds the *Louisville Courier-Journal*, that Senator Beck looked through when poring over an army wagon load of tariff statistics, that fish is now fitted to lead the finny tribe in biting for revenue only.

Two English sailors went ashore with their parrot in a Japanese port to see one of the famous jugglers. At every trick one of the sailors would say, "Now, wasn't that clever? Wonder what he'll do next?" After a large number of tricks followed each time by the same remark, the juggler made a mistake and dropped a burning stick on a pile of fireworks. The bombs and crackers exploded, tore off a part of the thatched roof, dispersed the audience, and scorched the juggler and his parrot. The explosion was hardly over when the parrot called out, "Now, wasn't that clever? Wonder what he'll do next?"

The number of dogs received last year in the Home for Lost Dogs in London, was 14,882, and of those 2,301 had been re-sold to their owners, while 1,506 were sent to new homes. There had been a large decrease in the number of dogs received in the number of dogs claimed, and the cost of those claimed had been 2s. 2½d. per animal. The Home had been viewed by people from all parts of the world, who testified to the excellence of the arrangements. All means had been adopted to prevent dogs being taken from the home for experiment or pathological purposes. The committee had decided to receive cats as soon as sufficient money was subscribed to pay for the erection of suitable accommodation.

The Young Ins have been for many months among the chief attractions of the Central Park menagerie. They were gentle and playful, and the keepers grew fond of them. Yesterday afternoon Keeper Ryan assisted in feeding the caribou. He carried a large piece of meat, with just sufficient bone to keep the animal's interest, and threw it into the cages. The cubs impatiently awaited their turn, and fought for the choice morsels, their food had been given to them, and the keepers were moving away, when one of the cubs, who was a year old, sprang forward, and seized the Superintendent Conklin tried to lasso it and get it out of the cage, but it died before it could be got at. Its cries excited the other animals, and the menagerie was quickly cleared of them. The cubs were then fretted and moaned all the evening.—*N. Y. Sun, March 23.*

There has been an interesting increase in the happy family of birds and beasts, which is usually around the old arsenal in Central Park. The latest comer on Saturday morning began its career of earthly troubles on a young camel. Its first experience of life was a rare one for a camel, for it found itself reposing in a heap of snow. Nevertheless, it did not mind this, for it was born in the Sahara, which ought to have been its native health, but proceeded to make itself as comfortable as it could until day dawned and a keeper removed the youthful quadruped to more comfortable quarters. For six hours the little infant was not permitted to get up, and then it was allowed to rise. The old Mrs. Camel was inclined to be somewhat ungracious to the little one, and had to be tied up with strong ropes before she would permit the caresses of her babe. Said babe is about the size of a colt, and is so ugly that if it ever catches sight of itself it will go out and hang itself to a tree and die. It consists principally of humps. These are long, lumbering, and inconveniently much in their own way. The infant camel has a back just like any other person's. There is no hump visible yet. The keeper says that the young beast will sprout a hump in a few days, and will then be as proud of it as a boarding-school boy of the first down on his chin. The infant camel is so short that it could not cut grass, if there were any to eat, without lying down. This slight inconvenience will also disappear in time, and the babe's neck will stretch out and curl up of itself in the manner most approved by camels everywhere, which reaches to the ground, and the animal, while it bears no resemblance to Artemus Ward's kangaroo and fails to jump or squeal to any pernicious extent, is, nevertheless, an "amusing little cuss." Provided the weather is not too cold, the keeper says how to the public to-day, and be on exhibition in the inclosure, and that the camel will be born on account of the snow on the ground. This young animal is the third camel born in the Park. Its mother was born there before him, and he is therefore a true American. As a Coudin, superintendent of the menagerie, says that none of the animals suffer from the cold weather.—*New York Times*.

"Brown's Bronchial Troches are excellent for the relief of Hoarseness or Sore Throat. They are exceedingly effective."—*Christian World, London, Eng.*

# HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, DOGS, HOGS & POULTRY. For Twenty Years Humphrey's Veterinary Specifics have been used by Farmers, Stock-breeders, Horse R. R. Travel & Hippodromes, Menagerie and others with perfect success.

**LIST OF SPECIFICS.**  
 A. A. Cures Fevers and Inflammation, Milk Fever, Spinal Meningitis, Ring Worms, 75c.  
 B. B. Cures Founder, Spavin, Stiffness, 75c.  
 C. C. Cures Distemper, Nasal Discharges, 75c.  
 D. D. Cures Cuts or Grabs, Worms, 75c.  
 E. E. Cures Cough, Heaves, Pneumonia, 75c.  
 F. F. Cures Colic or Gripes, Bellyache, 75c.  
 G. G. Prevents Abortion, 75c.  
 H. H. Cures all Urinary Diseases, 75c.  
 I. I. Cures Eruptive Diseases, Mange, &c. 75c.  
 J. J. Cures all Diseases of Migration, 75c.  
 Veterinary Case (black walnut) with Veterinary Manual, (50 pp.), by bottles of Medicine and Medicator, \$8.00.

These Veterinary Cases are sent free to any address on receipt of the price, or any order for Veterinary Medicine to the amount of \$5 or more. Humphrey's Veterinary Manual (50 pp.) sent free by mail on receipt of price, 50 cents. 1000 Specifics sent free on application. HUMPHREYS' HOMEOPATHIC MED. CO. 105 Fulton Street, New York.

## The Fishing Kit

And collection of BOOKS AND MAPS belonging to the late

LORENZO PROUTY,

now on exhibition and for sale by

304 Washington St., Boston, Mass.

Importers and Dealers in

**Fine Fishing Tackle**

AND CUTLERY.

## The Big March Storm

SEE

VENOR'S WEATHER BULLETIN,

Published Monthly.

Subscription, 60 cts. per annum. Montreal, Can.

DEMUTH BROTHERS,

Manufacturers of

Artificial Eyes for Taxidermists and Manufacturers Also, all kinds of Glass Work done to order. Catalogue Free of Charge by Mail. 89 WALKER ST., NEW YORK.

## AMERICAN Kennel Register.

A MONTHLY RECORD.

Its leading feature is the "Pedigree Register" of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is compiled to each dog, and an index will be compiled at the close of the annual volume, thus making it a complete work of reference. The pedigree registration fee is twenty-five cents, payable in advance.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs for sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include field trials.

Space will be devoted to all matters of importance to breeders and those interested in dogs, the object being to render the *American Kennel Register* a complete record of the topics of the day.

The *Register* will be published on the fifth day of each month. All matter intended for publication must be in the hands of its editor by the first day of the month. Entry blanks will be sent on receipt of stamped and addressed envelope.

The *American Kennel Register* will be sold by subscription only. The subscription price is one dollar per year.

Address *American Kennel Register*, P. O. Box 2, 822, New York City. Make drafts and money orders payable to the Forest and Stream Publishing Company.

\$72 A WEEK. \$12 a day at home easily made. Costly outfit free. Address TREN & CO. Augusta, Maine.

# Artificial Minnows, Insects, &c.

We manufacture the most complete assortment of Artificial Minnows, Insects, &c., ever offered to the public. Each season we add to our already large variety. We keep in stock from three to ten sizes of each style of minnow. The principal sorts are "Fancy Hollow Metal," "Devon or Angel," "Fancy Jointed Metal," "Plain Jointed Metal," "Solid Metal," "Metal Eels," "Caledonian," "Protean" and "Phantom." Next week we will show a cut of "Imbrie's Fairy," which is altogether the best artificial minnow ever made. Among our almost infinite variety of small baits (insects, &c.) for trolling, skittering or casting like a fly, we mention, Frogs, large and small, Fly Minnows, large and small, Shrimp, red and natural color, Beetles, Grasshoppers, large and small, gray and green, Cockchafers, Ladybirds, Gentles or Maggots, Helgramites or Dobsons, Green Grubs, Humble Bees, Caterpillars, Crickets, Potato Bugs, Creepers, Fluttering May Flies, Worms, Soft Lobsters.

Every minnow made by us is sewed on a card bearing our trade mark, and in a box with our full firm name and trade mark on it. All the small artificial baits are put up 4 dozen in a box, which has our full firm name on its label. Beware of imitations and never accept goods as of our make which are not properly labeled.

Orders received from anglers residing in cities in which the dealers keep a full line of our goods in stock will not be filled at any price.

**ABBIE & IMBRIE,**

Manufacturers of every description of

**Fine Fishing Tackle,**

48 & 50 MAIDEN LANE, NEW YORK.

## UNITED STATES MUTUAL ACCIDENT ASSOCIATION

\$5,000 Accident Insurance. \$25 Weekly Indemnity. Membership Fee, \$1. Annual cost about \$11. \$10,000 Insurance, with \$50 Weekly Indemnity, at Corresponding Rates. Write or call for Circular and Application Blank.

EUROPEAN PERMITS WITHOUT EXTRA CHARGE.

CHAS. B. PEET, President, (Of Rogers, Peet & Co.)

JAS. R. PITCHER, Secretary.

320 & 322 Broadway, N. Y.

## MANN'S Trolling Spoons.

Sixty varieties manufactured, suitable for trolling for all kinds of fish that will take an artificial bait. Our Perfect Revolving Spoon is undoubtedly the best general spoon for taking fish ever offered to the public.

Three sizes made—No. 20 for bass, pike, pickerel, or any fish under five pounds weight; No. 21 for large fish; No. 22 excellent for deep water fishing.

Beware of Imitations.

None genuine except with JOHN H. MANN'S name stamped on every spoon.

For sale by ABBIE & IMBRIE and JOHN P. MOORE'S SONS, New York. BARK, STODDARD & KENDALL, Boston, Mass. In Chicago and Detroit by the principal dealers in Sporting Goods.

**JOHN H. MANN & CO.,**  
SYRACUSE, N. Y.

 " 2. Bronze, " " " " " " " " 4 00

Reels guaranteed and forwarded by mail or express on receipt of price.

## Harrison's Celebrated Fish Hook.

Registered.

Whereas, It having come to our notice that some unprincipled persons, to gain their own unworthy ends, and to attempt to damage our good name, having spread reports to the effect that the manufacturers of the above hooks are defunct, we now take this opportunity of informing the American and British public that such reports are utterly false. The same efficient staff of workpeople is employed heretofore, and we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours, which are to be obtained from the most respectable wholesale houses in the trade. Signed, R. HARRISON, BAILEY & CO., Sole manufacturers of Harrison's Celebrated Fish Hooks, Redditch, England. (December, 1892.) Manufacturers also of Fishing Tackle of every description. Sewing and Sewing Machine Needles.

## Kynoch's Patent "Perfect" Brass Shells

MANUFACTURED BY

**Kynoch & Co., Birmingham, Eng.**

These shells are made of extra fine thin pliable metal, with reinforced base. Use either Winchester or Wesson primers. Can be reloaded as often as any of the thicker metal. Cost only about half as much. Weight less than paper shells, and in consideration of their reloading and other advantages, are really cheaper than the paper. They also shoot stronger and closer, and can be loaded heavier, as inside diameter is nearly two gauges larger. They possess a great advantage over all other brass shells, as owing to the thin metal they can be closed (as represented in cut) by simple use of the thumb or fingers, and straighten out to original shape when discharged. These goods have already gained a wide and favorable reputation in Europe, and in the opinion of many prominent sportsmen will soon supersede to a great extent the old style of both brass and paper. Samples will, upon application, be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or in case lots only (2,000 shells) by

**HERMANN BOKER & CO.,**

SOLE AMERICAN AGENTS.

101 & 103 Duane Street, New York.

WILLIAM READ & SONS, Boston, Mass., Agents for New England States.

We also carry a large stock (at all seasons) of Kynoch's regular thickness brass shells, adapted to the Berdan Primer. Price materially lower than the American make of same quality.

**UPTHEGROVE & McLELLAN,**

VALPARAISO, IND.

**HOLABIRD**

## SHOOTING SUITS

Of Waterproof Duck, Irish Fustian and Corduroy.

Unequalled in Convenience, Style, or Workmanship.

WRITE FOR CIRCULAR.

THIS

Is our Skeleton Coat or Game Bag; weighs but 15 ounces, has seven pockets and game pockets. It is of light material, dead grass color, and will hold the game of a successful day without losing a hair or feather. It can be worn over or under an ordinary coat. We will mail it to you for \$2.00. Send breast measure.

**B. F. NICHOLS & CO.,**

BOSTON, MASS.,

Manufacturers of

## HEXAGONAL SPLIT BAMBOO FISHING RODS,

REMOVED TO 153 MILK STREET.

## SUCCESS OF FISHCULTURE.

NOTWITHSTANDING there are frequent reports of the successes of fishculture in the pages of FOREST AND STREAM; the reports of the United States Fish Commission; the State commissions; the successes of the Deutsche Fischer Verein, the Société d'Acclimation, of Paris, and in Holland, and other countries, there is still an occasional skeptic. A Russian professor, A. J. Malmgren, has made a report to the Russian Government, in which he discourages the breeding of fish in Finland, because, as he alleges, the artificial breeding of fish, especially in the United States and Canada, has proved a failure. There is an adage that one must go away from home to hear the news, and it strikes us that the adage is true in this case. Where can the learned professor have obtained his information concerning the status of fishculture in the United States and Canada?

The only fish that has failed to appear, after streams have been liberally stocked with it, is the California salmon (*Oncorhynchus gairdneri*), when transplanted to the East. In its native habitat this fish has been steadily kept in the rivers by artificial propagation, notwithstanding the enormous drain of the canning industry, which threatened to exhaust the supply. Had there been no propagation on the McCloud River, the canneries of the Sacramento would have exhausted the supply long ago.

The salmon of the Atlantic (*Salmo salar*) which at the settlement of the country inhabited all the rivers as far south as the Housatonic River, in Connecticut, were exterminated by the early settlers before the adoption of fish protection in America, and have been restored to some of the streams. A few salmon were left in Maine, and from these the eggs were taken, and they are now plenty in the Penobscot and are becoming so in the Merimac River. The most thorough proof of the influence of fishculture was shown in the restocking of the Connecticut River with salmon. There had not been one of these fish taken in it for twenty-five years, and many persons argued that the conditions had been so changed by dams, severance and impurities from paper mills, etc., that salmon could not now live in it. The U. S. Fish Commission, in connection with the Commissioners of the New England States, thought it worth a trial, and for two or three years they planted salmon in the headwaters. Three years afterward salmon appeared in the river, only a dozen or so, but enough to show that some had lived. The fourth year large numbers were sent to market

by the fishermen at the mouth of the river, who had pound nets arranged so as to stop every fish. Two years later, when the plantings were exhausted, no more salmon were taken. The State of Connecticut would not prohibit her fishermen from capturing all of them at the mouth of the river before they could spawn, and the States lying to the north declined to expend more money for the purpose unless the fish could have a chance to ascend the stream. But the trial was a grand success, as it proved that the river is still fit for salmon, and that with fair play fishculture can again restore the Connecticut to its former productiveness.

Other instances might be cited, but we will merely refer to the success of the culture of land-locked salmon in the Adirondacks, where it was unknown before; in California of the shad, which was a stranger to Western waters; the wonderful growth of carp in America since its introduction a few years ago; and the keeping up of the stock of shad in the Hudson, in spite of increased fishing. The work referred to has all been done by the States and the general Government; in fact, it could not well be done by private means, and the work in the United States, so far from diminishing, is increasing each year.

To write this seems to us to be needless work. It is known to all who pay attention to this matter, and we regard it as being very much like an argument to prove that two and two make four. Reaping without sowing must eventually exterminate the corn, and the planting of fish bears the same relation to future yields as the planting of corn does to the harvest. If the planting is intelligently done, and the necessary conditions of soil and water are properly secured, there will only remain the chances of accident or enemies of the young crop to contend with in order to secure a harvest.

We commend this to Prof. Malmgren, and hope that, in all fairness, he will embody it in his next report to his government, in order that Finland may not be too far behind in a knowledge of what is being done in foreign lands.

## THE BOY AND THE GUN.

THE boy, bless his heart, is closer to nature than the man. He is a savage in civilized attire; he steals and lies without a blush of shame, persecutes and domineers, and delights in noise and destruction, and will do and dare anything to satisfy his untamed cravings. To make an uproar and kill something nothing quite so well serves him as gunpowder, and for its employment nothing serves him so well as the gun.

Boys have grown particular of these later years, as have the grown-up savages on the frontier, and must have breech-loaders and "catridges"; but when we graybeards were boys any tube of iron with a lock and stock was a prize. No matter how it missed fire, kicked or scattered, when it did go off you felt it as well as heard it, and it would sometimes kill a chipmunk or a robin, and so frighten a woodchuck that after one shot he would salute from his hole for half a day. What a big Injun was the boy who owned or had borrowed such a gun, and how all the other boys gathered about him to watch the mysterious process of loading. What a wise fellow was this to know that he must first put in the powder, and how much of it, and on top of it a wad of tow or wasp-nest or newspaper, and then the death-dealing pellets of precious shot poured out of a vial, and then more wadding. Then came the grand final act of priming. It was thrilling to see him place a G. D. cap between his teeth while he covered the box and returned it to his pocket, then cock the piece and put the cap on to the nipple. What if his thumb should slip from the striker as he eased it down! Sometimes it did, and then what a delightful scare if nothing worse; what shame for the unskillful engineer and the jeers of the envious, gunless crowd.

But nowadays, alas, almost any boy may have a gun, and only he is enviable who has the best. Well, if he will only use his dangerous toy as he should, let him have it, for the sporting instinct is strong in the young savage. And who for pure love of it is such a naturalist? Is it not he who notes the first comers of spring, meets the chipmunk and the woodchuck at their thresholds when they first come forth from their winter sleep; finds the earliest birds' nests, and knows where the squirrels breed? The sportsman who enjoys his sport most is he who loves nature best; and who of all the guild enjoys his day with the gun with greater zest than the boy?

Yes, let the boy have his gun, a sound, well-made one, but teach him how to use it—carefully, temperately, humanely. Always as if it were loaded, never out of season, nor too often in season, and never for mere love of slaughter.

## THE ALBANY BILLS.

AMONG the game bills introduced at Albany the three most prominent are the Townsend, the O'Connor and the Grady, this last being another form of the second. The Townsend and O'Connor bills were introduced into the Assembly; the Townsend bill was favorably reported by the Committee on Game Laws, passed by the Committee of the Whole and sent to the Senate. Here the Committee substituted for it the Grady bill, being under another name the O'Connor bill which had been defeated in the Assembly. These bills have already been adverted to in our columns and their respective merits noted. The Townsend bill is the only one of the lot deserving support. Its framers had solely in view the protection of game, which is the legitimate aim of a game bill. This is more than can be said of the Grady bill. A fourth bill, known as the Grady compromise bill, is a modification of the original Grady bill, and has been adopted as a substitute for it in the Senate. The "compromise" is on the crow and turkey principle. "You take the crow and give me the turkey; or, I'll take the turkey and you can have the crow." A choice bit of the "turkey" is an open market for woodcock from July 1 to February 1; another piece is the practical immunity from inquisitive detectives with search warrants; a third morsel is the sign-board proclamation scheme. In the rush which is always the order of the day at the close of the session, it is important that friends of game protection in the Legislature should closely watch the proceedings to see that the Townsend bill is not forgotten nor the Grady bill put through. The law is better as it stands than it would be if amended as Mr. Grady proposes.

THE CANOE MEET.—As has been announced in our Canoeing columns, the next meet of the American Canoe Association will be held at Stony Lake, near Peterboro', Canada, August 10 to 24. A large representation of American and Canadian canoeists is expected, and the meet promises to be in every way a success. The route to Stony Lake is to Lakefield via Peterboro' from Port Hope or Belleville, which points may be reached from the east or west by the Grand Trunk Railway. Port Hope is also reached by steamer from Rochester, N. Y., and Canadian ports. From Stony Lake, after the meet, many delightful routes will be open to the canoeists, one of these being the Ottonabee River, Rice Lake, and Trent River to the Bay of Quinte, and thence to the Thousand Islands. Provisions may be obtained at Peterboro' or Lakefield. Arrangements will be made to have all supplies required forwarded to the camp. Milk, butter, potatoes, eggs, etc., can be obtained from settlers in the vicinity. Fish are abundant in the lake. Maskinonge are caught by trolling. Spoon and other trolling baits of all kinds are used. Black bass may be caught by trolling or by still-fishing. In the latter case frogs, crawfish, grasshoppers or fat pork being used, and occasionally artificial flies.

THE USUAL MIDDLE.—With the approach of the time set for the meeting of the American and British teams comes the rush of explanatory letters, and there is now a possibility of a hitch in the arrangements over the wind-gauge question. According to a cablegram from London on Monday last, the British Rifle Association refuse to allow the American regulations, giving the use of the wind-gauge. It was thought that the correspondence which was opened by the American managers immediately after the conclusion of the last match had cleared away all possible misunderstandings, but now a fresh cloud arises, which may require an expenditure of pen and paper before it is dissipated. It is to be hoped that the cablegram only reflects a slight error in the reading of the correspondence, and not a determination on the part of the British authorities to go back to the antiquated regulations of the last match.

THE MICHIGAN LEGISLATURE has been overwhelmed with all sorts of proposed game law amendments this year, and as one way out of the middle a consolidation of all the bills has been effected. The result, if the bill becomes a law, will be a good one. Chief among the changes is a provision which throws upon the possessor of game out of season the burden of proof that it was legally killed. This is an important point.

THE EARLY BIRD PRINCIPLE is presumed to be a commendable one. In these days of competition and rivalry, enterprise carries the day. So, at least, believe certain Essex county, N. J., gunners, who have "opened the ball" and are now bagging woodcock. If this is not enterprise it is hoggeshipness.

## The Sportsman Tourist.

### A REMINISCENCE.

BY HENRY E. BAKER.

HOW oft in youth beside you crystal stream  
That slowly rippled 'neath the birch-tree's shade,  
The while the glaucous foliage o'er the water  
Their forest notes till all the place did seem  
Enchanted, I have felt my fancy dream  
Of Genii and their deeds, until afraid  
As evening came adown the forest glade,  
Where all was still except the owl's shrill scream  
From bower remote, and o'er the pathway, lined  
With huge shapes that rose on either hand,  
Not daring in my dream to look behind,  
I've sped upon the road I'd stand  
And see the lamplight gleaming through the blind  
To light the truant back from Fairy Land.

HALIFAX, N. S., April 10, 1883.

### AMONG THE BONIN ISLANDS.

"SWEETLIPS" and I were having good times, and we were happy. Among points in which our tastes agreed were great fondness for fishing, and a considerable disinclination for hard work, and to us had been assigned for our day's duty the supplying of our camp with fish, and we were fishing.

Our camp was not in the Adirondacks, and we tramping down a mountain brook; nor on one of the islands which dot the great lakes and the St. Lawrence, and we sitting at ease in arm chairs, lazily watching the outer ends of stiff rods for the electric twitches which proclaim a strike. No dainty, delicate fly, nor immediately upon formed our weapon, nor were we wasting time and patience in searching for good grounds. In the broadest sense—for we were catching all sorts of fish, and in the narrowest sense, for our gear was of the simplest—we were fishing.

For once, at least, in our lives, we had struck the right place, at the right time, and we were making the most of it. We had but to lower our pork-baited cod hooks to such depths as might suit us, and immediately haul in, perfectly certain that if from near bottom our hook would bring with it a gorgeous-hued rockfish, almost every time of a different species, and in size ranging from five to fifty pounds; and if from mid-depth some other odd fish of less brilliant hues would be sure to detach himself from the schools beneath us and pay us a visit.

There was but one drawback. "Sweetlips" was very lazy, and I very little, and this is hard work as well as play involved in the bringing of lively fifty pound fish through as many feet of water, and into the boat. But this was just the kind of hard work we liked.

Our anchor lay fully ten fathoms below us on a bed of many colored coral, the surface of which was broken up into crevices, grottoes and deep pools. But that we knew the depth we should have judged it far less. The water was wonderfully clear, and seemed to have the properties of a magnifying lens, for every little fish or shellfish was plainly visible as were the monsters which lay idly sleeping, or with hardly a fin quiver stole in and out of the openings in the bank; and the vibrations of the tentacles of the anemones, and the expansion and contraction of the polyps, thousands of both of which ornamented the coral were easily detected. Conchs, cowries and many other shellfish were also abundant. So plainly could we see everything that we had frequently endeavored to capture some particular fish by lowering the baited hook to his nose, but had as often failed, for generally the selected fish was sluggish, and perhaps enjoying an after dinner nap, others, livelier and hungrier, would rush in—and be taken in—instead.

We were seated in a little dugout canoe fishing with hand lines, and our locality was over a coral bank which forms one of the reefs near Coffin Island, one of the Bonin Islands, a group lying just north of the Ladrões, in the Pacific Ocean, and some 129° E. These Islands were discovered by Capt. Nathaniel Coffin, of Nantucket, while on a whaling voyage, and have for many years been resorted to by whalers to renew supplies of fresh provisions and water. The group consists of six or eight islands, of which but two, namely, Bonin and Coffin, are inhabited; the former by a settlement of thirty or forty people, mostly ex-American whalers, their wives brought from some of the islands to the command, of which they were natives, and their progeny; and the latter (at the time of my visit) by two white men, three Raven Island women and their children, one of the men indulging in two of the wives.

The settlement on Bonin Island called Port Lloyd had a governor and common council, and the people seemed very happy in their isolation, cultivating quantities of yams and other vegetables, and furnishing these, with pork, turtles and goats to the whalers in exchange for cloths, groceries, etc. They had two or three good whale boats, and very often killed whales, cutting them in on the beach.

At Coffin Island the two male inhabitants supported themselves in the same manner. One named Robinson, and called Captain by the other, was a man of considerable education. His ownership of sextants and other instruments of navigation, and quite a library, made it probable that he had been as claimed, a midshipman, and from her, living a mode of life indicated that it was quite possible that our sailors' views as to his having been a pirate in his young days were correct also.

Although so far away, Coffin Island is a part of the United States, and it became so in this way: At the date of our visit the Pacific Mail Steamship Line was being spoken of as among the developments of the future; and it was considered that a coaling station somewhere between San Francisco and Hong Kong would be necessary—for Perry had not yet made his treaty with Japan, and its rich resources in coal were unknown to the outside world. Commodore Perry, then in command of the East Indian Squadron, was directed to cause surveys and explorations of certain groups of islands (among which the Bonins were included) to decide upon their suitability for such a station.

The stop of war Plymouth, Captain John Kelley, was sent to the Bonins on this duty, and from her, lying at Port Lloyd, an expedition, consisting of two lieutenants, one midshipman, and thirty men, had in the launch and first cutter been sent to survey this, the most southern of the group, some thirty miles away.

Our surveying and exploring occupied us for over a week, at the end of which time the Plymouth stood over to pick

us up, and was anchored in a harbor we had selected and chartered. "Then with pomp and circumstance" we took possession. A tall flagstaff was raised, under which was buried a "casket" (in this case a preserved meat tin-case), containing coins and papers. From the flagstaff at noon, saluted by twenty-one guns, the American flag was hoisted, and on the staff was fastened a copper plate, with date and other suitable inscription, to show that on this, the—day of September, 1853, our captain, in the name of the United States of America, took formal possession of the island. Then, after appointing Captain Robinson to be U. S. Consul, we sailed away for China; and I have never heard from there since. I presume, though that a guess, that in due time our Consul will up the casket, appropriate the coins, sold the flag to a whale ship, and used the halliards to secure wild pigs, would not be far off. So, at least, I guessed in 1877, when, being then in command of the Blue-light, I met at Nantucket lineal descendants of Captain Coffin, and referred to this incident in a letter to your paper.

"Sweetlips" and I formed part of the surveyor's expedition, my duty being to watch tide gauges, and his to help me. We were but boys of sixteen, and on one tide at least rather neglected our duties, as I will show you in good time. "Sweetlips" was not his real name, only a pet name given him by the sailors on account of a personal peculiarity. He was a long, slab-sided, lean and lanky youth, with skim-milk and watery blue eyes, long yellow hair, a waxen face covered with freckles, and a large pair of thick, protruding, pulpy, crimson lips, hence his sobriquet. A very "Small bones" always in trouble, never-to-be-found-when-wanted, no-use-to-anybody but, "in everybody's mess but nobody's watch," but with nothing bad in his character. We were the only boys in the ship; I had been kind to him, refraining from reporting many little delinquencies; many a slice of soft-tack he had shared in mid-watch, and he was devoted to me—hence our companionship on this occasion. His real name was Jordan, by which I shall call him in future.

An hour or more of success had covered our dugout's bottom with a solid, deep layer of fish, and ourselves as thoroughly with scales, blood and slime, when there came a change. Almost simultaneously an unusually heavy tug at each line and sudden let up proclaimed danger, and our lines came in easily, for they were hookless, and after repeated this was repeated.

The origin of our difficulty was but too apparent. Between us and the bottom, at varying depths, an immense school of large sharks were gliding to and fro, and all of the rockfish had disappeared. Gradually the school worked upward, and soon in all directions the great cocked-hat shaped fins were seen cutting the surface.

We were, very evidently, the attraction; undoubtedly, if they came small, they scented our blood-soaked garments.

They made of us a center, with their orbit not a wide one.

It seemed as though they were considering how best to utilize us. A great fellow, not less than twelve feet long, came once toward the canoe, until his nose nearly touching, and his diabolical eyes glaring at us, he slowly snuck enough to clear our bottom and came up within two yards on the other side, head toward us. This began to look like business, and it would evidently not be a great while before the business might become a little more of a wide one.

Fortunately, the sharks did not know their own power, for with one good blow from any one of a dozen big flukes they could easily have provided themselves with rations; and, as there were at no time less than three or four, and sometimes a dozen surrounding us, the supply would have been short, and very quickly disposed of.

Subsequent events (in the fishing line) interested us no more, and we were very thankful when, having cut away our anchor line—for we dared not attempt to weigh—we started for the cove, into the very foot of which, and even into shoal water, some of our enemies pursued us.

On the beach, to welcome and help us, care for the canoe and fish, stood Caroline, and I must pause in my adventures to introduce her. I wish I could do it in terms to satisfy myself, but it is very hard after so many years have been steadily passing a brief moment in this line to do full justice to so very early an experience.

Caroline was the daughter of Capt. Robinson, who was a handsome, fair-skinned, brown-haired Englishman, and one of his wives a fine-looking Raven Island native.

"She is a rare combination of beauties inherited from both parents; from her mother the erect straight figure, tall, lithe and graceful, supple as a panther, and quick as a bird in every movement; from her father the fine, clear, blue eyes, the florid tints of her father glow like a hidden light; great black eyes, now mild and gentle as a seal's, and in a moment flashing with excitement. About twelve years, thus a child in age, but already more than child, not quite a woman; teeth perfect, features regular, and altogether as pretty a girl as one could wish to see."

Please be sure and not omit the quotation marks. The original of the above quotation I find in my log book, now thirty years old, and it is so identically the work of a very young and rather spoony writer, but I had to use it or else omit a description, and as Caroline will soon turn out to be the heroine of my yarn, I could not thus slight her. There is more about her in the same faded blue ink, but I think it is well to let it stay where it is.

The first day of our arrival I had completely gained the heart of this little maiden. I was the first and only boy she had ever seen, and my brass buttons and silver anchors were to her, as they (not mine) are to more sophisticated maidens, even to the present day, irresistible. The mercury in my artificial horizon, the mirrors of my sextant, my watch, and, above all, my stock of fish hooks, carefully displayed, had, step by step, overcome the timidity which at first caused her to fear and shun us; and that evening when, with the rum furnished by the natives (not by her father), we had got out our first drink, I said to Caroline, "Call that little community 'put it in stays,' as they call such performances—and I rescued her from a brute who was kissing her most lustily, she screaming with fright, my conquest was complete. She came to our tent, and was made much of and comforted by the lieutenants (now admirals) and myself.

From this time out she was my constant companion, play-fellow and guide. In my rambles through the woods, no well-broken pointer could more quickly detect a bird; no well-trained red bird pusher more surely mark its fall, and no retriever gather it more quickly; and her delight when I made a successful shot, was far beyond my own.

And at times she would take me in her little canoe, warning me to keep very still, paddle me to reefs where beautiful shells were to be found, or to fishing places where, in

shoaler water, we could soon get all we wished of smaller fish, untrodden generally by the large ones. Once though, a small shark, not over four feet long, took my hook, and I brought him to the surface, and fearing to haul him into the canoe was about to cut my line, when she stopped, and I caught a glimpse of the savage part of her composition. She had a long, sharp, disk-shaped knife, and with her eyes blazing, watched for a quiet moment, and sunk the blade to the middle in a spot she well knew, and unerringly struck just back of the head, severing the vertebrae, killing the fish almost instantly. I had seen bits of this savagery before, when in the woods she chased, captured, and joyously killed a wounded bird.

In our woods tramps we had to be a little careful and not get too far away, for in some localities there were great droves of wild hogs, which would attack a person on sight; these were the descendants of a few which, I was told, were put on shore many years ago by Capt. Howe, an American whaler, and had increased and multiplied greatly. The men, Capt. Robinson & Co., hunted them with Australian hounds, of which they owned several. They were trained to seize the pig by the ears and hold it until it was secured by ropes. Generally a sow, big with young, was selected, transported to the house, and then penned. At the time of our visit there were about a dozen pigs, old and young, in this pen, the stakes of which were fully ten feet high; had they been not over six, I am sure the pigs could have jumped them. They were very wild and savage, but the pork was good.

One incident of the first evening I shall never forget. The night was clear and brilliant; our tent occupied a bit of a horseshoe surrounded by high mountains, and right over our heads, over two thousand feet up, was the summit of a precipice, whose base was not a hundred yards from us. To this clambered some of our rum-inspired jacks, and about midnight I heard, for the first time, from this summit, "Way Down on the Swamvee River," sung by one of our foretopmen, Jimmy Keenan, who was the owner of a most melodious tenor voice.

I must return to my fishing. Caroline, when told of our trouble with the sharks, said: "Shark like pork very much; not like crab, all other fish like crab better." And in reply to our query where we could get plenty of crabs, she volunteered to guide us to the spot. Jumping into the canoe, under her guidance, and having paddled about two miles, we came to a great cove bored out by the action of the sea in the face of the rocks. I had passed it once when surveying, but there was then a stiff breeze, and the wide black cavernous mouth was belted by a line of foam and breakers, and the infuriating waves caused a tremendous roaring—altogether it did not tempt one to enter. This day, however, it was calm and smooth, and fortunately the tide was well out; although, as we afterward found, rising. Except that the entrance was wider, perhaps by six or eight feet, this cove in many respects resembles the famed Blue Grotto at Capri.

Paddling in until we could wade ashore, we sent Caroline back with the canoe, to remain off the entrance and wait for us; and, plunging in, we scrambled toward the crescent-shaped beach of white pebbles which, after turning a slight angle, fronted us. Hundreds of bits, some of them of enormous size, were scattered all over the beach, and we scuttled away an army of crabs of all sizes and descriptions—from tiny fiddlers to fellows as big as a dinner-plate, all making for the crevices in the walls. The beach was about fifty feet from the entrance, and the height of the cave from the low water surface about fifteen feet; but at the entrance this was reduced to about eight feet. At the beach the height was still less, and we had to stoop in chasing the crabs to the rear, where the cave was about ten feet wide, and could enter. Among the pebbles were conchs, cowries, harps and other rare shells, all dead and empty, and we wasted precious time in gathering them, but soon settled down to our work, first doffing our shirts, which we transformed into bags. Crab catching is not an easy matter; they run fast and bite hard; but they were so abundant that gradually we accumulated a good stock. Only a part of the entrance was wider, perhaps by six or eight feet, this cove in many respects resembles the famed Blue Grotto at Capri.

We took no little entry of time, and although after a while we heard our little sentry calling on us to hurry, we failed to do so, until with bags well filled we saw that our crescent beach had become considerably holding at arm's length, and we could enter. Among the pebbles were conchs, cowries, harps and other rare shells, all dead and empty, and we wasted precious time in gathering them, but soon settled down to our work, first doffing our shirts, which we transformed into bags. Crab catching is not an easy matter; they run fast and bite hard; but they were so abundant that gradually we accumulated a good stock. Only a part of the entrance was wider, perhaps by six or eight feet, this cove in many respects resembles the famed Blue Grotto at Capri.

Outside we could see a fresh sea breeze had sprung up, and the cavern was fronted by a line of breakers, outside of which Caroline had been compelled to take the canoe. Between us and the breakers was a space of comparatively still water. We saw at once that we were in for trouble. Treading water long enough to untie our shirt sleeves and release the prisoners we started for a tussle. Jordan was ahead and nearly to the exit when he stopped suddenly and fairly sprang backward, with the shout, "My God, sir, look there!" One look sent my heart down, for, right in our path, in the still water there projected the dorsal fin of a shark, which our morning's experience taught us was a large one.

We lost no time in getting back to shoal water, and, standing immersed to our arm pits, held council. For all that we knew to the contrary, the cavern would, at high tide, be filled to the roof, hence to stay there was to drown, and we dared not attempt to pass that frightful sentinel. There was but one course—take to the water, and that a hard one—the water on the rocks was rough and uneven, in many places covered with limpets and other shellfish; we must clamber out by them. With Jordan leading we started on our scramble. The task at first proved easier than we had thought; we were both good climbers, and our chase after the crabs had given us both valuable experience.

As we neared the exit we could see the girl, shouting and evidently in great anxiety. She did not see us, nor the shark, for behind us were four or five feet of water, and, reaching a tolerably safe foothold, cut a large mussel from the rocks and threw it at the shark in hopes of scaring him away. The result was not promising. The splash did attract his attention, but only to attract him as well, and he made for the spot.

Caroline caught sight of us, and at once came as near as she could to our assistance, but we had taken the largest of the canoes, and her strength was not equal to her will; if

anything her efforts did harm, as perhaps alarmed by the blows of her paddle on the water, the shark gave her and the canoe a wider berth, but came closer to us. Just at the left of the entrance, and but ten or fifteen feet distant, there was a large flat rock, which when we entered was at least two feet out of the water, and had a surface of six or eight square feet.

Our hopes were to reach this rock, which would be the one shallow spot available. To this end we had chosen the left hand wall for our climb. As we progressed, the rock became visible, the water, however, covering it and broken by it. We could not reach it without taking a risk, for we must drop and swim to it. Our plan was to climb out as far as possible, get close together, and selecting a point where the shark was at the furthest limit of his head, drop together and make for the rock, hoping that our united splash would scare him, and that if not we could with our knives perhaps protect each other, and at the worst one of us would escape.

This plan was not carried out. While still some distance from the entrance, and as much ahead of me, Jordan suddenly gave a piercing yell and dropped in a sprawl almost directly in front of the shark.

He had stepped upon a shell, which broke from under him. Either that yell or the splash proved his safeguard; the fin disappeared, and in a moment became again visible a hundred feet away. With two or three lusty strokes he gained the rock and stood erect, saved.

During this performance I stood still and, with lated breath, clung to that wall like a fly, helpless at last, for the sudden wrench to my already overtaxed nerves had demoralized me. After a little rest, I braced up and resumed my crawl, feeling a renewed hope that the shark might be as civil to me as he had been to Jordan, of whom the last I saw before devoting attention to my footsteps, was that he was endeavoring to get hold of the end of a pole which Caroline was reaching out from the canoe. The next I saw of him gave me a thrill of joy. He had succeeded in getting into the canoe, and the two of them, for she was an expert paddler, had gotten the boat inside of the reefs, and between me and the shark, although it was not out of danger, for right under their bow was a concealed rock, which I could see, but feared they could not. In attempting to pilot them clear of this danger, I in some way lost my balance, and went down "by the run."

I have a confused recollection of the plunge, of a grab at both ends of me as I came up—one I felt sure by the shark—a pulling scramble, during which we nearly capsize the canoe, and myself, as I recall, being welcomed by Jordan, who was half wild with excitement and reaction, catching my hand and shouting, "Glory Hallelujah!" and by Caroline, who stood sobbing—well I don't care to say how—it is, or rather was, nobody's business but ours; and Jordan wasn't a competent witness. Since those days I have "changed my condition," and am accustomed to considering bygoness as such.

As to perhaps Caroline, if her father carried out his intention about her, she is now a sedate matron in some New England village, with Carolines, and perhaps Caroline's Carolines of her own.

Recognizing the fact that her probable fate, if she remained on the island with him her eventual fate, would be that she would become the wife (married Island fashion) of some sailor, who, tempted by her beauty, would desert some vessel, and her father, who had resolved to give her if possible to the wife of some whaling captain, to be brought to America and educated as a Christian woman.

I have often wondered if this has occurred. And now as I write have half a hope that through this "personal" her whereabouts may transpire. I should be glad to hear from her. I should be both glad and sorry to again meet her—glad for many obvious reasons, sorry because I would be likely to find her just as at times to keep a blazing fire, rendering the use of other lights entirely unnecessary.

The dwelling was unclosed, and was not more than ten feet from the north side of the highway. All the outhouses were of the same unpretending character. Paint was unknown. The country all around was, and is, very unproductive, and no one unacquainted with the character of the country would have ever stopped there except as a last resort to avoid sleeping in the woods. Daniel Love, an old Scotchman, his wife Polly, and their only child, William, were the dwellers in this humble home, except for the last ten or fifteen years of the life of the owner, when Daniel McMillan a brother of Mrs. L., resided with them. The old man owned a few negroes, and with their labor, such as it was, and that of father and son, a scanty crop was made. The mistress (she was really the servant, and this state of affairs was not uncommon in the South during the existence of slavery) and one or two negro women spun and wove cotton and wool, and out of this the clothing of all was made. Mr. Love was the possessor of more than one thousand acres of land, and had quite a number of cattle, sheep and hogs. Such is a general outline of the condition of things.

The traveler, weary and dusty at the close of the day's journey, drew up to the door, and got out of his vehicle. It often happened that nobody would be seen for a few minutes, when suddenly some hunter, Tom, a negro boy, would show himself, and approach with a gift which evinced that "hurry" was a word whose significance was unknown on the premises. He would assist in looking after the horse, and at his convenience, carry the luggage into the piazza. About that time, the old lady would walk in noiselessly from the back part of the house, greet you with a pleasant smile and a few words of unstudied welcome. Upon your inquiring for Mr. Love and William, she would probably tell you they were away in the woods looking after the cattle and sheep, and would be in after awhile. Further questioning her, you might get the information that they took their single-barreled, flint-lock shotguns, thinking it might happen that they would see a deer or turkey during their search. She would then leave you, and you might amuse yourself by looking over some old copy of the *Payetteville Observer*, which a traveler had left with them, or a Patent Office report which some member of Congress had sent to him. Or, if so inclined, you might walk about the premises and see nailed up on posts, or the sides of a house, some trophies of the venatorial skill of the lord of the pine barrens—the antlers of many a buck which he and William had brought down by the aid of their guns. Just before dark, or between sundown and that time, you would hear the squall of one or more chickens, and have your olfactory nerves regaled with the aroma of roasting coffee. You would be called—upon the fire, and soon the blazing brands would fill the room with light and heat. After a time, the quiet voices of Uncle Daniel and William would be heard just outside of the house, and in they would come, dressed in woollen hunting shirts of a brownish color, set their guns up in the corner, hang their shotbags upon the ramrods, give you a very gentle grasp of the hand, and then seat themselves in split-bottomed chairs. You would ask, what luck they had had, and the old man would tell you that they had succeeded in getting a deer and a gobbler. Of course, you would want to see the game. A torch would be lighted, and you would witness one of the means by which the larder of the house was often supplied for the delight of the palate of many a guest. After being told how far the deer or turkey was from the hunter, when killed, that they had "toiled" the game on a pole for several miles, and would proceed to dress it, the old man would take a seat near his window, open the broad shutters, take a knot, throw it on the fire, and make the room "more cheerful and more bright."

The old lady would come in, and William would help his mother set out a folding table in the middle of the room, upon a floor well sprinkled with clean white sand. She would go to a chest, take out a clean cotton table cover and nicely spread it. Next she would take the silverware, and the plates, cups and saucers, knives and forks, and put them in their appropriate places. Lastly she would take a small waiter and put it at one end, and into this her sugar dish and cream bowl and teaspoons. Very shortly thereafter one of the negro girls would come in bearing a plate of biscuit and a dish of fried chicken. Retiring, she would soon return with a dish of broiled venison and some turkey steak. Mrs. L. would sit down to the table—eat, and you would give your family in Cumberland county a nice one for Christmas and New Year's dinners. In that day we had no Thanksgiving dinners; for we had no Thanksgiving day, known to our law. No doubt we were quite as grateful for Almighty benefactions as we are now; though we did not make quite so much public parade of the fact. That old man was one of the salt of the earth. He knew nothing of conventional or fashionable life. He never saw a railroad, nor a steamship. He had read but few books besides his Bible. He knew how to be honest and straightforward, kind, gentle and hospitable. No avarice dried up the fountain of his soul—no malignity, nor envy, nor hatred put gall and wormwood in his heart. And that old woman, who for forty years—neither long nor weary ones with her—had made herself happy, by doing her duty in the "lowly train of life's sequestered scene," as became a wife and a mother, was really one of the salt of the sex. To her, Mr. Love and William were the chief objects of her early adoration. Her boy—for boy he always was in her eyes—was, to his parents, ever loving and true. Though the old folks are "dead and gone," William lives there still, married but childless, and when he "shuffles off his mortal coil," the last of the race will have departed.

While you and Uncle Daniel and William are talking, that good old woman is deftly using her knitting needles upon a pair of yarn socks for the comfort of her dear old son—the wool clipped by them, washed and carded and spun by her. Oh, how sweetly, even now, after more than thirty years have passed over me, whitening my locks, and furrowing my cheek, does that maternal smile of Aunt Polly dwell in the house of my memory!

After you have conversed until your feelings are in full accord with the indications of your watch, Uncle Daniel will tell you that the time for the coming of the night is near, and you can take which one of them you choose. If you show by your conduct that your modesty is likely to be sorely tried, he will suggest that if Polly can stand it, he thinks you might be able to do so. And then, the old woman may go out, but will come back after you have thrown the

protecting blankets over you, and will knit away, until you have at last cause of your earthly surroundings. In the morning when you wake, after a night of healthful repose, refreshed and strong, you will see her, quickly moving about the fire. If she notices that you are awake she will express her sincere wish that you have had a good night. And then she glides out of the room, you get up, put on your clothes (they call it "dress," these days) and sit about the fire, which somebody has made while you were asleep.

In a few minutes Uncle Daniel and William come in, and from them that soon after you get in bed, weary with your ride of thirty miles, they, rested from their walk of over ten, had skinned the buck, cut it up and put it away; and rising at daybreak, had that very morning taken a tramp of several miles. Pretty soon, you have intimations that breakfast is approaching—for about an hour before you had smelt the odor of parching coffee, and soon thereafter heard the sound of the little coffee mill which was crushing her coffee after the arrival of her guests, and hence it was always fresh. The table would show the same bill of fare which you had tried the night before, with the addition of ham and eggs, or soft boiled eggs without the ham. When you indicated your wish to leave, your horse was brought out, harnessed and hitched to the vehicle, the baggage stowed away, and you make the usual inquiry as to the "damage" which you have inflicted. To your astonishment, you are told that seventy-five cents is ample remuneration for all the services which they have rendered for your accommodation. After your departure, other wayfarers, as you were, will take your place, and meet with the same hearty but unpretentious treatment; and they and you and all that preceded you, will sincerely wish that they may ever fare so well. The recollection of the turkey steak, made from the breast of a wild gobbler, will be one of the "memories of joys that are past, pleasant, but mournful to the soul."

I have said that the house had no adornments. It had none. The outside was destitute of attraction, and only those who knew the character of the inmates would ever, from choice, have made that house a stopping place. Its recommendation lay within. Like the laden casket of Portia, which "rather threatened than did promise aught," it contained the "counterfeit" or lovelessness and simplicity. Many places there were the same, but the old lady, with her architectural display, and well-graded walks, and beautiful flower gardens, there was no comfort, either to the inmates or to the stranger.

"Many a time and oft," in the years gone by, when a school boy going to and returning from our State university, where I was a student, when traveling on public or private business, or for mere pleasure, I have availed myself of the hospitality of this plain dwelling and enjoyed the food and lodging which it afforded, and which was as warm as the kind-hearted and sensible conversation of the occupants. I have joined the old man and William more than once on a deer hunt and sat around the same camp-fire, with others, who have since been carried across the river of time, and I trust are now with the blest. On these and other occasions the father and the son were true men—gentlemen—fit for the association of all persons who mistake not fine apparel and well chosen language for the higher and nobler characteristics of the heart. When I first went on a hunt, I had a small shotgun, 15-gauge and 30 inches long, weighing about 7 pounds. Their ideas of a deer weapon being a musket of about 10-bore in size, 4 feet in length and 10 or 12 pounds in weight, they looked with feelings of contempt upon my little gun, and regarded it as only fit for sparrows and snowbirds, or possibly a squirrel, if perched upon the lower limbs of a black jack. But after I had demonstrated its power by bringing down a fine buck, they admitted that it might, if the deer was at close range, but never could such a gun as that do the duty of "Old Betsy" in securing the skins of more than one hundred.

In that day, and for years before, the section to which I refer abounded in deer. It was poor and sparsely settled, and intersected with streams having wide swamps, which afforded food and shelter for these game animals. The forests of long-leaved pines were then undisturbed by the demand for naval stores. Now the sporting sector has taken nearly every one, scarified the trees, made the woods resound with his ax, and by this means quite as much as any other, the deer have been forced to seek a more quiet retreat. A few are still left, and when the trees are "worked up" and stillness again comes, it may be expected that numbers will return and again inhabit the waste places. But Uncle Daniel, having "served his day and generation," has passed away never to return; Aunt Polly—for in her day she had no Molasses Head, and she was a good deal like the shadow hand, and few are left who equal and none who surpass their virtues. WELLS.

## Natural History.

### TAME ALLIGATORS.

IN the sixth paper of Dr. Henshall's "Trip Around the Coast of Florida," he speaks of "Alligator Ferguson," who, in one of his yarns, remarks that he never killed a 'gator that measured over twelve feet in length. I would like to ask the readers of the *FOREST AND STREAM* what was the longest alligator known to have been killed? Also, who has killed a genuine crocodile in Florida?

I have three small tame alligators, which have been about in my possession. They are three feet long, and have grown six inches in that time. They are quite tame, and will come eagerly hustling along when I commence tapping on their box or calling them to feed. They are more shy than I would suppose possible. I have held a piece of meat over their box and have seen them jump so that their heads would appear above the box two feet high trying to get it. Putting one on the ground so as to give him a chance to run away, I have been surprised to find a very fast walk, and him again. When I stand and hold a stick in my hand, they will rise on their hind, keep up a constant hissing and whistling of tails, as if they like to be noticed and talked to. Altogether they show more brightness and intelligence than I thought the species had. I feed a little fresh meat twice a week in summer; in winter none at all, as they will not eat. At least these do not. This last winter I have several times found them frozen fast in the ice, and the water was low in the tank. I have correspondingly been quite disappointed in these little fellows, I should not care to be taken by one. Putting a small piece of meat on the end of a stick, I have several times had the stick twisted forcibly out of my

fingers, by its being accidentally caught with the meat. They have a way of rapidly rolling over and over when they bite anything, until the piece is twisted out. If they were very large they would not be very good pots to have around, especially if children were exposed.

The little swamps had been dry so long that the water was all gone except in the alligator holes. I saw something swimming about in a little pool about six feet in diameter, I sat down on the sand bar thrown up around the hole, which had probably been there for years, the work of the alligator when digging the hole. Soon the mucky nose and little green eyes of a young alligator popped up; then another, until I counted six or eight. I was not more than four feet from the water, but as I kept still, the little fellows did nothing but eye me sharply. Pretty soon I heard a strange clucking sound, and a big bunch of a nose and a pair of huge green goatee eyes were thrust up a little too close and familiar, I thought, considering the short acquaintance. I sat quite limber on foot, ready to take leave in case the old lady should harbor a notion to scoop me into the family circle. The stage of sixteen or eighteen eyes was embarrassing, as my audience seemed to expect something of me. Suddenly I heard a cry, and the audience disappeared suddenly and silently disappeared. I tried to snare the old one, but she pulled out of the nose I fixed, and was not at home for callers for several weeks. By fixing a sack under water and pulling a string I closed the hole behind three of the little ones, as the pets I now have: three feet each. The bay has filled up with water, so I have not been able to catch the rest, but expect to soon. KIRK.

LAWTAY, Fla., April 1.

A skin and skeleton of the Florida crocodile (*Crocodilus americanus*) is in the National Museum at Washington, specimen number 11,874. They were received by Prof. H. A. Ward, of Rochester, N. Y. The museum would like more specimens.

## THE BIRDS OF MAINE.

With Annotations of their Comparative Abundance, Dates of Migration, Breeding Habits, etc.

BY EVERETT SMITH.

### SUMMARY.

THE following classification of the birds already enumerated in this catalogue may prove of interest to its readers.

CLASS A.—Residents, or species found here during the entire year; 33 species.

CLASS B.—Summer Visitors. Species found here in summer, and with but few exceptions of regular occurrence; 113 species.

CLASS C.—Winter Visitors. Species found here in winter, but usually not at any other time, and with few exceptions of regular occurrence; 21 species.

CLASS D.—Migrants. Species found here during migrations, but with few exceptions not at other times; 67 species.

CLASS E.—Stragglers or Irregular Visitors; 67 species.

A.—Residents, or species found here during the entire year; 33 species.

1. Golden-crowned Kinglet.
2. Blue-backed Chickadee.
3. Hairy Woodpecker.
4. Red-bellied Nuthatch.
5. Brown Creeper.
6. Common Crossbill.
7. White-winged Crossbill.
8. House Sparrow.
9. Raven.
10. Crow.
11. Blue Jay.
12. Pileated Woodpecker.
13. Hairy Woodpecker.
14. Downy Woodpecker.
15. Black-backed Three-toed Woodpecker.
16. Hairy Woodpecker.
17. Great Horned Owl.
18. Long-eared Owl.
19. Barred Owl.
20. Screech Owl.
21. Great Horned Owl.
22. Hairy Woodpecker.
23. Downy Woodpecker.
24. Black-backed Three-toed Woodpecker.
25. Hairy Woodpecker.
26. Great Horned Owl.
27. Long-eared Owl.
28. Barred Owl.
29. Screech Owl.
30. Great Horned Owl.
31. Hairy Woodpecker.
32. Downy Woodpecker.
33. Black-backed Three-toed Woodpecker.

B.—Summer Visitors, or species found here in summer, and with but few exceptions of regular occurrence; 113 species.

1. Wilson's Thrush. Regularly breeds.
2. Swainson's Thrush. Regularly breeds.
3. Heron. Regularly breeds.
4. Robin. Regularly breeds.
5. Catbird. Regularly breeds.
6. Rufous Thrush. Regularly breeds.
7. Bluebird. Regularly breeds.
8. Yellow Warbler. Regularly breeds.
9. Winter Wren. Regularly breeds.
10. Short-billed Marsh Wren. More evidence needed as to abundance and regularity of occurrence and breeding.
11. Golden-crowned Kinglet. Regularly breeds.
12. Water Thrush. Regularly breeds.
13. Black and White or Variegated Warbler. Regularly breeds.
14. Nashville Warbler. Regularly breeds.
15. Wandering or Tennessee Warbler. Probably breeds regularly or in restricted localities.
16. Blue Yellow-backed Warbler. Regularly breeds.
17. Cape May Warbler. Probably breeds regularly in very limited numbers in restricted localities.
18. Golden Warbler. Regularly breeds.
19. Black-throated White Warbler. Probably breeds regularly.
20. Magnolia Warbler. Regularly breeds.
21. Chestnut-sided Warbler. Regularly breeds.
22. Bay-breasted Warbler. Probably breeds regularly.
23. Blackburn's Warbler. Regularly breeds.
24. Black-throated Green Warbler. Regularly breeds.
25. Pine Warbler. Regularly breeds.
26. Redpoll Warbler. A few breed. In the sixth line of Catalogue notes on this species, for "spar" read "spar". "Nearly all pass beyond the limits of the State" to breed.
27. Philadelphia Warbler. Probably breeds regularly, but in limited numbers and in restricted localities.
28. Maryland Warbler. Regularly breeds.
29. Canadian Warbler. Regularly breeds.
30. Redstart. Regularly breeds.
31. Red-eyed Vireo. Regularly breeds.
32. Philadelphia Vireo. Apparently of regular occurrence. More evidence needed in regard to breeding.
33. Warbling Vireo. Regularly breeds.
34. Yellow-throated Vireo. Probably of regular occurrence.
35. Solitary Vireo. Regularly breeds.
36. Long-legged Vireo. Regularly breeds.
37. Purple Martin. Regularly breeds.
38. Chimney Swift. Regularly breeds.
39. Barn Swallow. Regularly breeds.

61. White-bellied Swallow. Regularly breeds.
62. Bank Swallow. Regularly breeds.
63. Scissor-tail. Regularly breeds.
64. Cedar-bird. Common "Waxwing." Regularly breeds, and of irregular occurrence in winter.
65. House-brewster. Regularly breeds.
66. Purple Finch. Regularly breeds.
67. Pine Linnet. Regularly breeds, apparently of irregular winter occurrence.
68. Goldfinch. Regularly breeds, apparently irregular in winter occurrence. In fifth line of Catalogue notes of this species, read: "In winter it is found in small spots around larger end."
69. Savanna Sparrow. Regularly breeds.
70. Jay-winged Sparrow. Regularly breeds.
71. Sharp-shinned Sparrow. Regularly breeds.
72. Swamp Sparrow. Regularly breeds.
73. Song Sparrow. Regularly breeds.
74. White-throated Sparrow. Regularly breeds.
75. Chipping Sparrow. Regularly breeds.
76. Field Sparrow. Regularly breeds.
77. Blue Grosbeak. Regularly breeds.
78. Indigo Bunting. Regularly breeds.
79. Red-winged Blackbird. Regularly breeds.
80. Cowbird. Regularly breeds.
81. Red-winged Blackbird. Regularly breeds.
82. Meadow Lark. Regularly breeds.
83. Baltimore Oriole. Regularly breeds.
84. Rusty Grackle. Regularly breeds.
85. Purple Grackle. Regularly breeds.
86. Kingbird. Regularly breeds.
87. Green-crowned Flycatcher. Regularly breeds.
88. Phoebe Flycatcher. Regularly breeds.
89. Yellow-crowned Flycatcher. Regularly breeds.
90. Wood Pewee Flycatcher. Regularly breeds.
91. Yellow-bellied Flycatcher. Regularly breeds.
92. Trail's Flycatcher. Regularly breeds.
93. Least Flycatcher. Regularly breeds.
94. Rusty-throated Hummingbird. Regularly breeds.
95. Chimney Swift. Regularly breeds.
96. Whippoorwill. Regularly breeds.
97. Night Hawk. Regularly breeds.
98. Black-bellied Cuckoo. Regularly breeds.
99. Belted Kingfisher. Regularly breeds.
100. Yellow-bellied Woodpecker. Regularly breeds.
101. Golden-crowned Woodpecker. Regularly breeds.
102. Short-eared Owl. Regularly breeds.
103. Rusty-crowned Owl. Regularly breeds.
104. Marsh Hawk. Regularly breeds.
105. Little Leaded Eagle. Regularly breeds. Of irregular occurrence in winter.
106. Passenger Pigeon. Regularly breeds.
107. Piping Plover. Regularly breeds.
108. Golden Plover. Regularly breeds.
109. Wilson's Snipe. Probably a few continue to regularly breed here.
110. Herring Gull. Regularly breeds.
111. Spotted Tattler. Regularly breeds.
112. Solitary Tattler. Some birds of this species remain in Maine throughout the year, and probably breed here, but further evidence is yet needed as to nesting.
113. Great Blue Heron. Regularly breeds.
114. Great Egret. Regularly breeds.
115. Night Heron. Regularly breeds.
116. Bittern. Regularly breeds.
117. Least Bittern. Probably a few yet breed here. In third from last line of the Catalogue notes of this species, for "storks" read "storks" of marsh hay, etc.
118. Virginia Rail. Regularly breeds.
119. Carolina Rail. Regularly breeds.
120. Yellow Rail. Of regular occurrence. Probably breeds.
121. Wood Duck. Regularly breeds.
122. Laughing Gull. Apparently of irregular occurrence, but known to breed.
123. Wilson's Tern. Regularly breeds.
124. Arctic Tern. Regularly breeds.
125. Leach's Petrel. Regularly breeds.
126. Red-bellied Gull. Regularly breeds.
127. White-bellied Gull. Regularly breeds.
128. Herring Gull. Of regular occurrence, most commonly seen on the coast.
129. Lark Shrike. Of regular occurrence.
130. Pine Grosbeak. Of regular occurrence in winter, but irregularly distributed. Probably a few breed within the limits of the State, but satisfactory evidence is needed.
131. Redpoll Linnet. Of regular occurrence. Abundant.
132. Snow Bunting. Of regular occurrence.
133. Lapland Bunting. Of irregular occurrence.
134. Canada Jay. Of regular occurrence.
135. Great Gray Owl. Of irregular occurrence.
136. Snowy Owl. Apparently of regular occurrence.
137. Hawk Owl. Apparently of regular occurrence.
138. Tengmalm's Owl. Possibly of regular occurrence. In the Catalogue notes of this species, the last paragraph is erroneous. A specimen was taken by hand alive in Portland city, March 8, 1883.
139. Purple Sandpiper. Of regular occurrence.
140. Dunlop's or Iceland Golden-eye Duck. Probably of regular occurrence.
141. Harlequin Duck. Of regular occurrence.
142. Eider Duck. Of regular occurrence. The ducks of this species observed breeding on the Maine coast within recent years have been limited to a few individuals, and possibly these few have now ceased to breed here. Therefore, I do not include the species among birds named as "Residents."
143. King Eider Duck. Probably of regular occurrence in limited numbers.
144. Glaucous Gull. Apparently of regular occurrence, but never abundant. In fifth line of Catalogue notes of this species, for "black-tailed" read "black-tailed." Of regular occurrence, and occasionally abundant. The autumn migrations extend southward, but the coast of Maine is probably the southernmost limit of any abundance of this species.
145. Little Guillemot, Dovekie. Apparently of regular occurrence, but of very limited abundance.
146. Forked Guillemot, Long-billed Murre. So uncommon that more evidence is needed as to regularity of the occurrence of this species here.
147. Bretnich's Guillemot, Short-billed Murre. Of regular occurrence. Common, especially during migrations.
148. Migrants. Species found here during migration, but with few exceptions, not at other times; 67 species.
149. Ace's Thrush. Spring and autumn.
150. Bay-breasted Warbler. Spring and autumn. More evidence needed as to regularity of occurrence in summer or winter, and as to breeding here. Abundant during migrations.
151. Tree Sparrow. Spring and autumn. No record of specimens taken in spring.
152. Wilson's Sparrow. Spring and autumn. Apparently rare in spring.
153. Ipswich Sparrow. Spring and autumn.
154. White-crowned Sparrow. Spring and autumn.
155. Tree Sparrow. Spring and autumn.
156. Fox Sparrow. Spring and autumn.
157. Peregrine Falcon. Spring and autumn. Probably a regular migrant, but the species is apparently not common here at any time.
158. Pigeon Hawk. Spring and autumn.
159. Black-bellied Plover. Spring and autumn.
160. Golden Plover. Autumn only.
161. Semipalmated Plover. Ring-necked. Spring and autumn.
162. Turnstone. Spring and autumn.
163. Red-breasted snipe. Spring and autumn.
164. Long-legged snipe. Spring and autumn.
165. Least Sandpiper. Spring and autumn.
166. White-rumped Sandpiper. Spring and autumn.
167. Pezomachus. Autumn.
168. Dunlin. Autumn. Rarely appears on the shores of Maine in spring.
169. Red-breasted Sandpiper. Spring and autumn.

170. Sanderling. Autumn. Very rarely appears on the shores of Maine in spring.
171. Semipalmated Tattler. Winter. Autumn. Very rarely occurs here in spring.
172. Great Yellowlegs Tattler. Spring and autumn.
173. Semipalmated Tattler. Winter. Of irregular appearance on the shores of Maine during the summer migrations.
174. Hudsonian Godwit. Autumn.
175. Hudsonian Curlew. Spring and autumn.
176. Esquimaux Curlew. Autumn. In Catalogue notes of this species, in second line, for "spring" read "summer." Usually seen here in spring and autumn.
177. Phalarope. Spring and autumn.
178. Northern Phalarope. Spring and autumn.
179. Wilson's Phalarope. Apparently of irregular occurrence, or in such limited numbers that more evidence is needed in regard to the appearance of this species on our coast.
180. American Coot. Autumn. Never abundant.
181. Brand Goose. Spring and autumn.
182. Canada Goose. Spring and autumn.
183. Sprigland Goose. Spring and autumn.
184. American Wildgoose. Autumn.
185. Green-winged Teal. Spring and autumn.
186. Blue-winged Teal. Autumn.
187. Great Scaup Duck. Spring and autumn.
188. Little Scaup Duck. Spring and autumn.
189. Ruddy Duck. Autumn.
190. Barlehead Duck. Spring and autumn. A few remain throughout the winter.
191. Long-tailed Duck. Spring and autumn. Common in winter.
192. Hareling or White-winged Teal. Spring and autumn. Some remain throughout each winter.
193. Surf Scoter. Spring and autumn. A few remain throughout each winter.
194. American Scoter. Spring and autumn. But few remain throughout the winter.
195. Hooded Merganser. Spring and autumn. Never abundant here, and although it is probable a few regularly breed within the limits of the State, in lack of satisfactory evidence the species is named a migrant only.
196. Cormorant. Spring and autumn.
197. Double-crested Cormorant. Spring and autumn. In third line of Catalogue notes on this species, read: "All the cormorants are locally termed *shags* by fishermen."
198. Pomarine Lestrin. Spring and autumn. In fifth line of Catalogue notes of this species, read: "The species is named a migrant only." More evidence needed in regard to abundance and regularity of the occurrence of this species here.
199. Long-tailed or Hudson's Gull. Spring and autumn. Nos. 266 and 268 are common and of regular occurrence off the Maine coast, being most abundant during August and September.
200. Black-backed Gull. Spring and autumn. A few remain here each winter.
201. Ring-billed Gull. Spring and autumn.
202. Kittiwake Gull. Spring and autumn. Also regularly in winter.
203. Bonaparte's Gull. Spring and autumn.
204. Caspian Tern. Probably a regular migrant.
205. Black Tern. Of occurrence during spring and autumn migrations, in very limited numbers, however. Uncommon, and apparently of irregular occurrence.
206. Wilson's Petrel. Autumn, and probably in spring also.
207. Greater Shearwater or Hazden. Spring and autumn.
208. Sooty Shearwater or Black Hardhead. Spring and autumn. The hawks are usually most abundant off the Maine coast in August.
209. Red-throated Diver or Loon. Spring and autumn.
210. Red-throated Loon. Spring and autumn. A few remain here in winter.
211. Horned Grebe. Spring and autumn. A few remain in winter. Evidence is needed as to regular breeding here.
212. Razor-billed Auk. This species cannot properly be regarded as "resident" in Maine.
- 213.—Stragglers or Irregular Visitors; 69 species.
214. Wood Thrush. Record of but one specimen taken.
215. Mockingbird. Stragglers or escaped cage-birds.
216. House Chat. Record of but one specimen taken in Maine.
217. Blue-gray Gnatcatcher. Record of but one specimen observed in Maine. In third line of Catalogue notes of this species, for "shot" read "seen."
218. Prothonotary Warbler. Record of but one specimen taken.
219. Worm-eating Warbler. But one specimen reported as taken within the fifty years.
220. Orange-crowned Warbler. More evidence needed of the occurrence of this species.
221. Agile or Connecticut Warbler. Record of two specimens taken.
222. Yellow-breasted Chat. Record of one specimen taken.
223. Yellow-crowned Vireo. Record of a pair nesting. This species occurs irregularly. More evidence wanted in regard to occurrence of this species.
224. Summer Tanager. Record of a single specimen taken.
225. Bohemian Chatcatcher or "Waxwing." Of irregular occurrence, usually in winter.
226. Cardinal Grosbeak. Stragglers or escaped cage-birds.
227. Blue Grosbeak. Record of a single specimen taken.
228. Yellow-winged Sparrow. Apparently occurs only as a straggler.
229. Baltimore Oriole. Apparently occurs only as a straggler.
230. Boat-tailed Grackle. Record of but one instance.
231. Western Kingbird. Record of a single specimen taken.
232. Yellow-bellied Cuckoo. Apparently occurs irregularly only.
233. Red-headed Woodpecker. Apparently of irregular occurrence only.
234. Barn Owl. Record of a single specimen taken.
235. Screech Owl. Apparently of irregular occurrence, but not rare, and has been taken in summer and in winter.
236. Iceland Gull. Record of but one specimen taken.
237. Labrador Gull. Occurs only as a straggler.
238. Cooper's Hawk. Apparently of irregular occurrence only.
239. Golden Eagle. Apparently of irregular occurrence.
240. Turkey Vulture. Straggler.
241. Black Vulture. Straggler.
242. Carolina Jay. Straggler.
243. Virginia Partridge or Quail. Occurrence only by artificial introduction from other States.
244. European Quail. Occurrence only by artificial introduction from Europe.
245. Killdeer Plover. Straggler.
246. Oyster Catcher. Record of a single specimen taken.
247. Bird's Sandpiper. Straggler.
248. Curlew Sandpiper. Straggler.
249. Ruff-bellied Sandpiper. Apparently of irregular occurrence only.
250. Ruff-bellied Straggler from Europe.
251. Great White Egret. Straggler.
252. Long-billed Curlew. Straggler.
253. Great White Egret. Straggler.
254. Little White Egret. Straggler.
255. Little Blue Heron. Record of a single specimen taken.
256. Avocet. Straggler.
257. Black-necked Stilt. Straggler.
258. Kingbird. Straggler.
259. Clapper Rail. Straggler.
260. Junco Rail. Record of a single specimen; identification doubtful.
261. Purple Gallinule. Straggler.
262. Common Gallinule. Straggler.
263. Common Swan. Straggler.
264. Snow Goose. Of irregular occurrence.
265. Mallard. Of irregular occurrence.
266. Gadwall. Straggler.
267. Shoveler Duck. Straggler.
268. King-neck Duck. Straggler.
269. Redhead Duck. Of irregular occurrence.
270. Canvas-back Duck. Of irregular occurrence.
271. Murrelet. No record of any specimen taken within the United States since 1872.
272. Gannet. Of irregular occurrence.
273. White Pelican. Straggler.
274. Frigate Pelican. A single specimen shot near the harbor of Halifax, Nova Scotia, Oct. 16, 1875, and sent to Mr. Andrew Downes, of Boston. It was taken as a straggler from the south past the coast of Maine.
275. Sabine's Gull. Apparently a straggler, or at least of irregular occurrence, and in very limited numbers. Record of but two specimens taken here.
276. Gull-billed Tern. Apparently of irregular occurrence only.
277. Donnell's Tern. Apparently a straggler, or at least of irregular occurrence only.
278. Least Tern. Straggler.
279. Sooty Tern. Record of a single specimen taken.
280. Black Skimmer. Straggler.
281. Ice Plover. Apparently a straggler only.
282. Black-throated Diver or Loon. On account of the lack of satisfactory evidence as to the occurrence of this species on our coast, it can now only be regarded as a straggler, or of irregular occurrence.

This classification is made in the order of relative importance as it appears to the writer, although the migrants may be regarded as a class of equal importance with the winter visitors. Still, eagles rank last in importance and interest as a class, although some individual instances are of ornithological importance.

In reading the Catalogue as published I notice many errors of a typographical nature, perhaps due to carelessly written manuscript, but I trust that readers will comprehend such errors.

In the preparation of these notes for publication in *FOREST AND STREAM* the writer has endeavored to avoid as much as possible all technicalities and to express explicitly and without ambiguity such items as were selected for the object in view.

Conscious of an inability to convey any information of value to scientific ornithologists, and of the truth of the saying that "there's nothing new under the sun," I have published in this connection such of my notes as seemed of probable interest or value to readers who, like myself, are observers and students of birds and their ways, and in seeking to acquire some knowledge of natural history and a constant source of pleasure.

By a continuance of observations, additions can be made to the list of species enumerated for this region, for the territory is extensive and remarkably varied as regards distribution of species.

In conclusion I wish to say to collectors, taxidermists, sportsmen and others that it is always a pleasure for me to receive birds or skins sent for examination, or identification, or any notes in regard to birds. Already I am obtaining agreeable recompense for my labor in preparing this local list of birds by new correspondence and the receipt of specimens, and I hope for a continuance of such favors from all those to whom I have been indebted in the past.

PORTLAND, ME., U. S. AMERICA.

EVERETT SMITH.

## THE STUDY OF NATURE.

AS the game laws will probably not be altered or repealed so that professional men and others may hunt and fish during their summer's vacation, let me suggest to such persons that they then study nature and make a specialty of some branch of natural history.

I know a clergyman who several years ago began the study of ants during a summer's vacation. He found the study so pleasant and interesting that he continued it during succeeding vacations. He published a book on the subject. As a scientist he is well known. Now he also studies spiders. One vacation he came to Texas to study its ants, whose homes here are curious and wonderful. If he told me that his entomological studies had given him health and much pleasure.

A clergyman once told me that he thought it was small business for a man to be looking after "bugs" and other insects. I asked him who made the insects. After a short time he replied, saying that he supposed God did it. He had not thought of them as the work of God, and hence worthy of the attention and study of man.

Geology, also, affords a grand study for all. Everyone should know at least the main features of the earth, its rocks, and at least its most common minerals. But the study of such subjects will generally need any recommendation. A knowledge of them gives never-failing interest to all rambles among hills and mountains, especially where nature shows herself in her grandest forms of rock-work.

Botany presents a large and inviting field of study everywhere in the country, especially in the summer, and even in the winter the trees can be known and studied. I have often thought that sportsmen with general knowledge of botany, particularly of trees, would have their means of pleasure much increased. Nor would they then be tempted to kill more game than necessary. When their larler at camp is well supplied with meat or fish they might make notes on the different species of trees around; their size and height. This would give an increased and more permanent value to their communications, which already many of them have their observations on the various branches of natural history. Much has been said about the animal life of forest and stream, but very few details of the actual forest have been given in the columns of *FOREST AND STREAM*.

ASTORIA, TEX., April 2, 1893.

S. B. BUCKLEY.

CAROLINA Doves' Nests.—*Editor Forest and Stream:* I may not be good enough to answer your readers that the Carolina dove (*Zenaidura macroura*) has no regular habit of incubation. A few days since I found one sitting on two eggs in an old robin's nest, reconstructed by a few new twigs placed inside. A day or so before I found one sitting on her eggs in a cedar tree, on a newly constructed nest, formed very loosely of small twigs, on a projecting limb about eight feet from the ground. Again, during the spring of 1881 I found a dove sitting on two eggs laid on a stump in a thick wood, without a twig or anything pertaining to a nest.—OLD TURKEY (Long Hill, N. J., April 23, 1893).

TURKEY BUZZARD IN MAINE.—The following is taken from the *Lewiston (Maine) Gazette* of April 20: "The bird recently shot by Abel Sanborn, of East Fryeburg, which was supposed to be a bald-headed eagle, proved to be a turkey buzzard (*Cathartes aura*), a very rare species in this northern latitude, of which only two specimens have been reported in our State." The same bird, or another of the same species, was seen here several times, and a number of persons were within gunshot of it, but, supposing it to be an eagle, would not shoot.—R. A. GUSCIE (Appleton, Maine).

DO SQUIRRELS EAT FISH?—A friend of mine, driving last Sunday, when near a brook, saw a red squirrel run along on the rocks lining the brook with something alive in its mouth. He stopped his horse, and when the squirrel reached the swimming, it stopped twice, and the living thing in its mouth appeared to be the wriggling tail end of a fish about as long as a finger. On starting the horse the little fellow scampered off into the bushes with its prey.—C. GERBER, JR.

WHITE PELICANS IN IOWA.—Charles City, Ia., April 16, 1893.—There was a large flight of white pelicans at this place on the evening of the 15th, estimated at over 1,000, and every one who could scrape up a gun or a shooting party of any kind was out after them. One was killed by M. G. Tower. A common rat was run into the river here by some boy, and, after swimming 100 yards to the opposite side of the river, recrossed, not much the worse for the swim.—ZIR KOON.

## Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of *FOREST AND STREAM*. Will not our correspondents favor us with such advice?

## SOME LIARS I HAVE KNOWN.

A GOOD portion of my past life having been spent around the sportsman's "flickering camp-fire," it has been my good or evil fortune to meet with many characters to whom truth was indeed stranger than fiction.

The individuals to whom we allude do not lie for gain or self-advantage, but are men whose mental and moral idiosyncrasies render them prone to exaggeration, who, like the Indian specimen, will, when we listen and wonder, from a budding fact, throw a sky-clearing squint.

These narrators, who draw upon their imaginations for their facts, may be classed under several heads. First, the "conscientious exaggerator," who really believes that the tale he tells is true, or very near the truth. Next comes the "romancer," who, "of imagination all compact," can, from the "airy nothings" of his brain, rear castles as enchanting as ever rose at the command of genius of the lamp. Of these we have heard in the last of the "Lionel" and, thirdly, your straight-forward, cold-blooded, matter-of-fact liar, who tells his story with a voice and manner so earnest and convincing, that the listener finds himself startled as with a shock at the least shadow of an unbelief. To this latter class belonged old Dave W., who, although he claimed to own a large cotton plantation on Red River, and also to have at one time represented his native State in the halls of her Legislature, was, at the time of which we write, living upon the bank of the Sandlower River, in a shanty so small that, not unlike the Irishman's ancestral palace, one might have almost reached his arm down the chimney and unlatched the door.

Standing one day upon the bank of this most beautiful of Southern rivers, I saw my neighbor, Den H., riding up, with his Winchester lying across his lap. As I knew that Den would shoot at anything, from a baldheaded eagle to a cotton-tail moccasin, I pointed out to him a water turkey (see the snake-like, here generally called) sitting motionless upon the limb of a dead tree overhanging the river, and some three hundred yards distant. Alighting, Den elevated the sights of his rifle, and, resting it against a tree, sighted and fired. By accident the lead sped true to its mark, and the bird fell dead upon the water beneath. Just at this moment old Dave, with his slow, gliding, still-hunter walk, came up to where we were standing.

A pretty good one, I said to him, as coming to a halt he leaned his long hunting rifle against the tree under which we stood.

"Pretty fair, pretty fair," he replied; "enmost as good as I wonst make myself."

"Well, Dave, tell us about that shot," I said.

Hitching up his pants and making them more secure with a thorn, which he had substituted for a button, he sank slowly down upon a projecting root, and began as follows: "You see, 'twas while me and Tom Powell was a-fishing up on Sky Lake endurin' the high water of '88. We was so busy a-cuttin' out our float road we didn't have time to hunt, so one day just afore sundown we found out we didn't have any grub. So what does I do but pick up old Betsy, which she was a long Kanetuck rifle what I had named after a gal I was sweet on, what lived down on Big Chafferier, an' says I to Tom, says I, 'I'll git er duck.' So I walked down to the bank of the old Sky Lake, and I seed three woolly-heads about a quarter of a mile from shore. Says I to myself, 'It's duck or no meat, an' anyways I'll try 'er.' So I up an' drewed a coise head on the nearest one, an' when old Betsy spoke if that duck didn't turn over on his back dead as a door-nail my name ain't Dave. Well, thinks I to myself, 'One duck won't be much for two hungry men,' so I loaded up old Betsy again, an' by that time them other two woolly-heads was out of sight. You see they didn't fly when I shot the first one, but kept a-swimmin' cross the lake. So I flung up old Bets an' gin er squint long her top side, an' then I gin her a kinder fill an' pulled trigger, an' would you-a-believed it I killed both of them yuther ducks, for they was swimmin' in a line, you see."

"How far off, Dave," said Ben H., "do you think those last ducks were when you pulled trigger?"

"Think hard to tell," answered Dave, "but as near as I can come to it, it must a been about five mile away. I took Tom just one hour to go in his dugout an' fetch 'em in, and I think he was a paddling about a four-mile lick all the time."

As neither of us made any remarks on this extraordinary shot, Dave took a chew of tobacco and continued, "That was about as long a range shot as I ever knowed, exceptin' 'wunst, an' that was the time a fellow shot me clean through, down at the mouth of Big Sunflower."

We did not either of us express any surprise at this last remark, only Ben said, "Well, Dave, tell us how that happened."

"Well, you see," he went on in his low monotonous matter-of-fact tone, "it was while I was a workin' a long old Billy Tucker just afore the mouth of this yer very river, when one day we boys found we had about run short o' lead for bullets. In them days we didn't have these yer new-fangled guns (giving a little cough, the first and only time he coughed along, bang! bang! went their guns, till if you'd a bin there you'd a thought another war had done broke out down the river. Well, 'twas pretty much the same thing every boat, an' I think we must a dug about a hundred an' fifty pounds o' lead out that bank every time one went by. Nowsomewer, after a while of this thing leaked out, an' as we had enough lead to last us about ten year, we took our game down."

"Well, one day old Capin' Wiley he landed his boat at old Billy's camp an' called me to come aboard, an' when he'd got me ahind the pilot-house, says he, 'Dave,' says he, 'I'm going to have er big lead or them that shootin' fellows up from Picketsburg next trip, an' I want you to have old Billy's pet deers down on the pint when you hears me a

blowin' down the river.' You see," says he, "I wants ter bet then that fellows that we will see a deer soon as we strikes the Sandlower, an' he won't be a deer, no more ther." "All right," says I, "supose as how you'll go havins it when you win." "All right," says he. Well, in about a week I hearn the old Argo, that was the name o' Capin' Wiley's boat, a blowin' down the river, so I gits a head o' cabbage an' I tells them deers down to the pint. Well, presently I seed the boat push her nose round the bend way down the river, so I laid that cabbage down on the sand an' I crept into all the edge of the bushes, an' I laid down a thinkin' all the time how much my havins in that bet would be, when the first thing I knowed something 'bout as big as my fist took me "dup" right in the snail of my back, an' when I turned around an' seed er puff of white smoke curl up from the hurricane roof of the boat, I knowed then I was shot for certain. You see, one of them shootin' fellows had one of them old-fashion Dutch yawgers that carried about a pound an' a half ball, an' he had plugged me clean through, though that boat must a bin at least five miles off when he pulled trigger on them deers, for I hearn afterwards it was by accident he hit me."

"Pretty near killed you, too, didn't it, Dave?" said Ben W. "Yes, pretty nigh," said Dave, very slowly, as he took another chew of tobacco, "I laid me for enmost a week."

Alas for poor old Dave. His body "lies a moulderin' in the ground," and he will lie no more. He has crossed over the river. He has gone to the "spirit land," and doubtless "sparks" as he always called them, dwell on his "little brown jug."—More deadlly far than "Dutch yawgers"—had much to do with his untimely taking off. Peace to his bones. TUCKABO.

## THE GRADY COMPROMISE BILL.

UTICA, N. Y., April 21, 1892.

Editor Forest and Stream:

I have the Compromise Bill, Senate Doc. 455. We have carefully read it. Your editorial, "Patent Coffee Mill," is as applicable to this as to the O'Connor bill. This bill is all declaration and no protection. It opens the New York market practically without limit, especially on woodcock, to supply summer resorts from July to February. New York is the great center from which illegal game is distributed over the whole country. With the allowed month for sale after open season, both July and August are open to them, by which the "law-breakers" can "skin" the whole State, while the law-abiding, who need no law, get entirely "left." The "private park" scheme is the most dangerous one for the sportsman ever put forward. It is a scheme to take the public for health and recreation is in danger of being turned into a vast "monopoly" for supply of the New York markets, and that too in the near future upon mere proclamation. Sportsmen, going to the Adirondacks will soon find themselves "not invited."

The whole plan of this bill is as bad as possibly can be: it is as bad as no law, or worse. It is a mere gloss and sham. The penal section abolishes the present accumulation of penalties for each bird, fish, etc., so that for the immense profits of New York markets, and receivers of illegal game and fish in "monopoly," is imposed a mere paltry penalty of twenty dollars, which they can cheerfully pay for the monopoly privilege.

The section allowing the "surrender" of game "illegally killed," in "exemption of civil and criminal prosecution," is a beautiful piece of sentimental philanthropy, for the benefit of the thousands who are sold out, for pleasure, and not for game. It nullifies the whole law.

I cannot go over the whole bill; the above is a specimen. We shall take measures to defeat it, and it will be defeated, even if we get no amendment of benefit this year. It is to be hoped that sportsmen will wake up to the full sense of the dangers and mistakes of seeking special privileges, and of looking for their interests in a bill gotten up by the paid attorney of New York market men and pushed with champagne and cigars.

Vice-Pres. Utica Fish and Game Protective Association.

## ILLINOIS GAME NOTES.

DUCKS, geese and a few swans plenty here this year, on all the small streams, more so than for several years past. There is a number of them and many a friend of mine killed nine ducks at one shot last week.

Small game, as prairie chickens, rabbits, quail, etc., in abundance in season. Quail so plentiful that in flocks of a dozen or more they will alight in trees not fifteen feet from the house where I am stopping. Lots of foxes, "the woods are full of them." Any number of rabbits, their tracks may be seen in the snow all around the houses and barns inside the city limits. Deer are everywhere, and trapped every night within forty feet of the house. A farmer recently came in here with 204 to sell. They hunt them with dogs and ferrets, also chase them into snow drifts, where, unable to run, they are slaughtered with clubs.

The game laws are neither respected nor enforced. Parties go out daily for chickens, quail, and rabbits. Natural result, the supply is fast decreasing, which, as far as the natives are concerned, is well and good. Serves them right. Was troubled by some friends to go with them after quail, being informed game laws weren't enforced, but although longing for the sport, positively refused out of principle, condemning their action in strong terms.

Taking a trip down through the western part of Kentucky, Tennessee, Mississippi and Louisiana, I saw many of negro boys along the route of the railroad, out with shotguns. Was informed that they kept the game shot entirely away from the white men. In Mississippi I saw a lot of these darkies having immense rabbits which they had shot, over twice the size of any to be found in this part of the country. JOHNET, III., April 12.

CHICAGO.

BUTTE CITY, MONT., April 15.—At the second annual meeting of Butte City Rod and Gun Club, the following officers were elected: President, F. C. Beck; Vice-President, Henry Young; Secretary, Fred. Gilbert; Treasurer, E. S. Paxson. We have a club of thirty-five members, who are jolly good fellows, and take a great interest in its well-being, and regard the game law like true sportsmen. A committee was appointed to do all in their power to bring to certain parties who have for a long time been disregarding the game laws. Our first club shoot was held on Friday last. Although a cold wind with dashes of snow prevailed, some good scores were made. Our treasurer made a hit and carried away the medal, which, by the way, was a leather one of fine finish, and shows excellent workmanship.—B. UTRE.

## DAVY CROCKETT'S RIFLE.

THROUGH the courtesy of Col. Bob H. Crockett, of DeWitt, Ark., we have enjoyed the rare pleasure of handling the historic arm once used by his grandfather, the famous pioneer, bear-killer, statesman and patriot, Davy Crockett. The rifle was presented by the young William Philadelphus, Crockett then being on a tour through the North. The maker was Constable, of Hoiyland, N. Y., who put it up in the highest style of the art. The lines of the gun are well shown in the drawing which we have had prepared and publish herewith. The pistol grip is a beauty; we have never seen one its superior, nor did we ever hold any other rifle that "came up" so well as this grand old arm of Davy Crockett's. It shoots as well as it looks.

The mountings are of coin silver, finely engraved, with representations of deer, bear, alligator and raccoon. Beneath the stock, just in front of the trigger guard, is, or was—all but the outline having been worn away by constant usage—the Goddess of Liberty, with the words "Constitution and Laws." Upon the top of the octagonal barrel is the inscription in letters of gold sunk into the barrel:

Presented by the Young Men of Philadelphia to the Hon. David Crockett, of Tenn.

The bore takes thirty-two balls to the pound. The gun has been in constant use since first the original owner carried it back to the States, and innumerable deer, bears, turkeys and other game have fallen off its discharges. We trust that the present owner may live many a year to use the heirloom.

Holding the rifle in our hands and "drawing a bead" on the sparrows perched on the wires across the street, our thoughts went back to the "Autobiography," that classic among the books in the American boy's library. We have all read it, years ago when we were boys. "I spy the wolf," if incident mislead it, made this plea. From Crockett's own account of his life we have taken out a few paragraphs to serve as settings for the rifle. They are not so satisfactory as we could wish—extracts rarely are—but they may invite some of our friends to a perusal of the book, in which event justice will be done to the hero.

David Crockett was born in 1786 in what is now Eastern Tennessee, the country at that time being infested with Indians. Beyond the memory of the surviving of a canoe with his brothers upon the brink of a fall in the river, and his uncle's shooting a man in the woods by mistake for a deer—he tells us little of his childhood, which appears to have been brief and very quickly merged into early manhood. They were giants in those days, and cast in heroic mold. What with subduing the wilderness, fighting Indians, and keeping the larder supplied with bear meat, the Tennessee settler had a man's work before him, and the children could waste but brief time in the frivolities of youth. When twelve years of age our hero began to make up his acquaintance with hard times, and plenty of them—an acquaintance which grew more intimate all through his life, to its tragic close in the Alamo. One winter Crockett made a foot journey of four hundred miles into Virginia; the following year he ran away from home; at fifteen he returned and worked a year to "lift" some of his father's debt; at sixteen he was known for the first time as a hunter—he fell desperately in love, seriously contemplated matrimony, and was jilted. His lack of education, he thought, was one cause for his failure in the love suit, and he determined to remedy the defect.

"I thought I would try to go to school some; and as the Quaker had a married son, who was living about a mile and a half from him, and keeping a school, I proposed to him that I would go to school for three months, and work for him the other two, to pay my board and schooling. He agreed I might come on those terms; and so at it I went, learning and working backward and forward, until I had been with him nine to six months. In this time I learned to read a little in my primer, to write my own name, and to cipher some in the three first rules in figures. And this was all the schooling I ever had in my life up to this day. I should have continued longer, if it hadn't been that I concluded I could do any thing longer without a wife; and so I cut out to hunt me one."

His life was now an odd mingling of hard work, hunting and love-making.

"I had by this time got to be mighty fond of the rifle, and had bought a capital one. I most generally carried her with me wherever I went, and though I had got back to the old Quaker's to live, who was a very particular man, would sometimes slip out and attend the shooting matches, where they shot for beef. I always tried, though, to keep it a secret from him."

"Just now I heard of a shooting match in the neighborhood, right between where I lived and my girl's house, and I determined to kill two birds with one stone—to go to the shooting match first and then to see her. I therefore made the Quaker believe I was going to hunt for deer, as they were plenty about in those parts; but, instead of hunting them, I went straight on to the shooting match, where I joined in with a partner, and we put in several shots for the beef. I was mighty lucky, and when the match was over I had won the whole beef. This was on Saturday, and my success had put me in the finest humor in the world. So I sold my part of the beef for five dollars in the real grist, for I believe that was before banknotes was invented; at least, I had never heard of any. I now started on to ask for my wife, for, though the next Thursday was our wedding day, I had never said a word to her parents about it. I had always dreaded the undertaking so bad that I had put the evil hour off as long as possible, and, indeed, I calculated they would know me so well they wouldn't raise any objection to having me for their son-in-law. I had a great deal better opinion of myself, I found, than other people had of me; but I moved on with a light heart, and my five dollars jingling in my pocket, thinking all the time there were but few greater men in the world than myself."

He had won his beef, but his flow of humor was quenched when he came to the house and found that his intended bride had jilted him for another fellow. "Down-spirited" over the unhappy termination of this second suit, Crockett was hunting one day in the forest, brooding like the melancholy Jacques, when coming to a cabin where dwelt a Dutch widow and her "ugly" daughter, he was confronted with the head of the ever-soothing old adage, "there was a good fish in the sea as had ever been caught out of it," and through the kindly offices of the same friendly match-maker, he was introduced to a pert young Irish miss, of whom he says, "I must confess I was plucky well pleased with her from the word go." But here again turned up the trouble-some and ubiquitous rival, "so attentive to her that I could hardly get to slip in a word edgeways. I began to think I

was barking up the wrong tree again; but I was determined to stand up to my rack, fiddle or no fiddle."

Then ensued a bit of woodland romance which is well worth to be written in notes of Success and verse:

"It was about two weeks after that I was sent for to engage in a wolf hunt, where a great number of men were to meet, with their dogs and guns, and where the best sort of sport was expected. I went as large as life, but I had to hunt in strange woods, and in a part of the country which was very thinly inhabited. While I was out it clouded up, and I began to get scared; and in a little while I was so much so, that I did not know where I was, nor what was the thing about it. I set out the way I thought it was, but it turned out with me, as it always does with a lost man, I was wrong, and took exactly the contrary direction from the right one. And for the information of young hunters, I will just say, in this place, that whenever a fellow gets bad lost, the way home is just the way he don't think it is. 'This rifle will hit nine times out of ten. I went ahead, though, about six or seven miles, when I found night was coming on fast; but at this distressing time I saw a little woman strutting it along through the woods like all wrath, and so I cut on foot, for I was determined I wouldn't lose sight of her that night any more. I run on till she saw me, and she stopped; for she was as glad to see me as I was to see her, as she was lost as well as me. When I came up to her, who should she be but my little girl, that I had been paying my respects to. She had been out hunting her father's horses, and had missed her way, and had no knowledge where she was, or how far it was to any house, or what way would take us there. She had been traveling all day, and was mighty tired; and I would have taken her up, and tosted her, if it hadn't been that I wanted her just where I could see her all the time, for I thought she looked sweeter than sugar; and by this time I loved her almost well enough to eat her."

"At last I came to a path, that I know'd must go somewhere, and so we followed it, till we came to a house, at about dark. Here we staid all night. I set up all night courting; and in the morning we parted. She went to her home, from which we were distant about seven miles, and I to mine, which was ten miles off."

Such devotion could not fail of its reward, and Crockett settled down to domestic life on a farm. But, as the years went by, he was tired at length of the unproductive idleness, and out for a country where bears and deer were more abundant.

"The Duck and Elk river country (in Tennessee) was just beginning to settle, and I determined to try that. I had now one old horse, and a couple of two-year-old colts. They were both broke to the halter, and my father-in-law proposed that, if I went, he would go with me, and take one horse to help me move. So we all fixed up, and I packed my two colts with as many of my things as they could bear; and away we went across the mountains. We got on well enough, and arrived safely in Lincoln county, on the head of the Mulberry fork of Elk River. I found this a very rich country, and so new that I began to distinguish myself as a hunter, and to lay the foundation for all my future greatness; but mighty little did I know of what sort it was going to be for clear and manly game I killed abundance; but the bear had been much more common in those parts, and were not so plenty as I could have wished."

In 1813 Crockett volunteered in the Creek War, feeling "wolfish all over." But his services as a hunter appear to have been more useful than as a warrior; for the troops were often in more danger of starvation than of being scalped, and Crockett's rifle was busy in providing "meat" for them.

"As the army marched, I hunted every day, and would kill every hawk, bird and squirrel that I could find. Others did the same; and it was a rule with us, that when we stopped at night, the hunters would throw all they killed in a pile, and then we would make a general division among all the men. One evening I came in, having killed nothing that day. I had a very sick man in my mess, and I wanted something for him; so I immediately went to Snuffy's fire, where I went to the fire of a Captain Cowen, who commanded my company after the promotion of Major Russell, and informed him that I was on the hunt of something for a sick man to eat. I knowed the captain was as bad off as the rest of us, but I found him boiling a turkey's gizzard. He said he had divided the turkey out among the sick, that Major Smiley had killed it, and that nothing else had been killed that day. I immediately went to Snuffy's fire, where I found him boiling another gizzard. I told him that it was the first turkey I had ever seen have two gizzards. But so it was, I got nothing for my sick man. And now, seeing that every fellow must shift for himself, I determined that in the morning I would come up missing; so I took my mess and cut out to go ahead of the army. We know'd that nothing more could happen to us if we went than if we stayed, for it looked like it was to be starvation any way; we therefore determined to go on the old saying, root hog or die. We passed two camps, at which our men that had gone on before us, had killed Indians. At one they had killed nine and at the other three. About daylight we came to a small river, which I thought was the Scamby; but we continued on for three days, killing little or nothing to eat, till, at last, we all began to get warily ready to give up the ghost, and lie down and die; for we had no prospect of getting any more, and we knew we couldn't go much further without it."

"We came to a large prairie, that was about six miles across it, and in this I saw a trail which I knowed was made by bear, deer, and turkeys. We went on through it till we came to a large creek, and the low grounds were all set over with wild rice, looking as green as a wheat field. We here made a halt, unsaddled our horses, and turned the loose grass under the trees."

"One of my companions, a Mr. Vanzant, and myself, then went up the low grounds to hunt. We had gone some distance, finding nothing, when, at last, I found a squirrel, which I shot, but he got into a hole in the tree. The game was small, but necessity is not very particular, so I thought I must have him, and I climbed that tree thirty feet high, without a limb, and pulled him out of his hole. I shouldn't relate such small matters, out of my head, but I don't think I am hungry, and I don't know of anything to eat. I soon killed two other squirrels, and fired at a large hawk. At this a large gang of turkeys rose from the canebrake, and flew across the creek to where my friend was, who had just before crossed it. He soon fired on a large gobbler, and I heard it fall. By this time my gun was loaded again, and I saw one sitting on my side of the creek, which had flew over when he fired; so I blazed away, and down I brought

him. I gathered him up, and a fine turkey he was. I now began to think we had struck a breeze of luck, and almost forgot our past sufferings, in the prospect of once more having something to eat. I raised the shout, and my comrades came to me, and they went on to my camp with the game we had killed. While we were cooking two of our mess had been out, and each of them had found a bee-tree. We turned into cooking some of our game, but we had neither salt nor bread. Just at this moment, on looking down the creek, we saw our men, who had gone on before us for provisions, coming to us. They came up, and measured out to each man a cupful of flour. With this, we thickened our soup, and roasted our turkey, and our friends took dinner with us, and then went on."

"We now took our tomahawks, and went out and cut our bee-trees, out of which we got a fine chance of honey; though we had been starving so long that we feared to eat much at a time, till, like the Irish by hanging, we got used to it again. We rested that night without moving our camp; and the next morning myself and Vanzant again turned out to hunt. We had not gone far before I wounded a fine buck badly; and while pursuing him, I was walking on a large tree that had fallen down, when from the top of it a large bear broke out and ran off. I had no dogs, and I was sorry enough for it; for of all the hunting I ever did, I have always delighted most in bear hunting. Soon after this I killed a large buck; and we had just gotten him to camp when our poor starved army came up. They told us that to lessen their sufferings as much as possible, Captain William Russell had had his horse led up to be shot for them to eat, just at the moment that they saw our men returning, who had carried on the flour."

"We were now about four hundred miles from Fort Decatur, and we gave away all our meat and honey, and went on with the rest of the army. When we got there, they could give us only one ration of meat, but not a mouthful of bread. I immediately got a canoe, and taking my gun, crossed over the river and went to the Big Warriors' town. I had a large hat, and I offered an Indian a silver dollar for my hat full of corn. He told me that his corn was all 'shusken,' which in English means, it was all gone. But he showed me where an Indian lived, who, he said, had corn. I went to him and made the same offer to him. He could talk a little broken English, and said to me, 'You got any powder?' You told him, and he said, 'I had. He then said, 'We swap my corn for powder and bullet.' I took out about ten bullets, and showed him; and he proposed to give me a hat full of corn for them. I took him up mighty quick. I then offered to give him ten charges of powder for another hat full of corn. To this he agreed very willingly. So I took off my hunting shirt, and tied up my corn; and though it had cost me very little of my powder and lead, yet I wouldn't have taken fifty silver dollars for it. I returned to the camp, and the next morning we started for the Hickory Ground, which was thirty miles off. It was here that General Jackson met the Indians, and made peace with the body of the nation."

In 1821 our hero "gave his name" as a candidate for the State Legislature. He knew nothing of "the Government," but he was a man of sense, and he knew his own mind, and his glib competitors; but his mother-wit and skill with the rifle carried him triumphantly through. "I went first into Heckman county; to see what I could do among the people as a candidate. Here they told me that they wanted to move their town nearer to the center of the county, and I must come out in favor of it. There's no devil if I knowed what this meant, or how the thing was to be done; but I said I'd look into the identical case plan, but I don't find it in the 'non-committal.' About this time there was a great squirrel hunt on Duck River, which was among my people. They were to hunt two days; then to meet and count the scalps, and have a big barbecue, and what might be called a tip-top country frolic. The dinner, and a general treat, was all to be paid for by the party having taken the fewest scalps. I joined on side taking the place of a white rapt hawk, going to get a gun ready for the hunt. I killed great many squirrels, and when we counted scalps, my party was victorious"—and later, when they counted the election ballots he was still ahead, and took his seat.

In 1837 Crockett was elected to Congress. In this canvass he played the famous "coon-skin trick, which he relates as follows:

"Well, I started off to the Cross Roads, dressed in my hunting shirt, and my rifle on my shoulder. Many of our constituents had assembled there to get a taste of the quality of the candidates at orating. Job Snelling, a gambler-slanted Yankee, who had been caught somewhere about Plymouth Bay, and been shipped to the West with a cargo of codfish and rum, erected a large shanty, and set up shop for the occasion. A large posse of the voters had assembled before I arrived, and my opponent had already made considerable headway with his specifiying and his treating, when he spied me about a rifle shot from the camp, snarling along as if I was not a party in business. 'There comes Crockett,' cried one. 'Let us hear the Colonel,' cried another, and so I mounted the stump that had been cut down for the occasion, and began to bushwhack in the most approved style."

"I had not been up long before there was such an uproar in the crowd that I could not hear my own voice, and some of my constituents began to know that they could not listen to me on such a dry subject as the welfare of the nation, until they had something to drink, and that I must treat 'em. Accordingly I jumped down from the rostrum, and led the way to the shanties, followed by my constituents, shouting, 'Huzza for Crockett,' and 'Crockett forever.'"

"When we entered the shanties, Job was busy, feeling out his rum in a style that showed that he was making good it, and I went to the bar for a quart of the best, but the crooked critter returned no other answer than by pointing at a board over the bar, on which he had chalked in large letters, 'Pay to-day and trust to-morrow.' Now that idea brought me all up standing; it was sort of cornering in which there was no back out, for ready money in the West in those times was the shiest thing in all nature, and it was most particularly shy of the value of that precious metal."

"The citizens, seeing my predicament, fell off to the other side, and I was left deserted and alone, as the Government was, when he no longer has any offices to bestow. I saw, plain as day, that the tide of popular opinion was against me, and that, unless I got some rum speedily, I should lose my election as sure as there are snakes in Virginia—and it must be done soon, or even burned brandy wouldn't do me. So I walked away from the shanties, but my mother guess sort from the way I entered it, for on this occasion I

had no train after me, and not a voice shouted 'Huzza for Crockett.' Popularly sometimes depends on a very small matter, indeed, in this particular it was worth a quart of New England rum, and no more.

"Well knowing that a crisis was at hand, I stuck into the woods with my rifle on my shoulder, my best friend in time of need, and, as good fortune would have it, I had not been out more than a quarter of an hour before I treed a fat 'coon, and in the pulling of a trigger he lay dead at the root of a tree. I soon whipped his hairy jacket off his back, and again bent my way toward the shantee, and walked up to the bar, but not alone, for this time I had half a dozen of my constituents at my heels. I threw down the 'coon skin upon the counter and called for a quart, and Job, though busy in dealing out rum, forgot to point to his chalked rules and regulations, for he knew that a 'coon was as good legal tender for a quart in the West as a New York shilling any day in the year.

"My constituents now flocked about me and cried 'Huzza for Crockett.' 'Crockett for ever,' and finding the tide had taken a turn, I told them several yams, to get them in a good humor, and having soon dispatched the value of the 'coon, I went out and mounted the stump without opposition, and a clear majority of the voters followed me to see what I had to offer for the good of the nation. Before I was half through, one of my constituents moved that they would hear the balance of my speech after they had washed down the first part with some more of Job Snelling's extract of corn-stalk and molasses; and the question being put up, it was carried unanimously. It wasn't considered necessary to tell the yeas and nays, so we adjourned to the shantee, and on the way I began to reckon that the fate of the nation pretty much depended upon my shooting another 'coon.

"While standing at the bar, feeling sort of bashful while Job's rules and regulations stared me in the face, I cast down my eyes and discovered one end of the 'coon skin sticking between the logs that supported the bar. Job had stung it there in the hurry of business. I gave it a sort of quick jerk, and it followed my hand as natural as if I had been the rightful owner. I slapped it on the counter, and Job, little dreaming that he was barking up the wrong tree, shoved along another bottle, while my constituents quickly disposed of with great good humor, for some of them saw the trick, and then we withdrew to the rostrum to discuss the affairs of the nation.

"I don't know how it was, but the voters soon became dry again, and nothing would do but we must adjourn to the shantee, and as luck would have it, the 'coon skin was still sticking between the logs, as if Job had flung it there on purpose to tempt me. I was not slow in raising it to the counter; the rum followed, of course, and I wish I may be shot, if I didn't, before the day was over, get ten quarts for the same identical skin, and from a fellow, too, who in those parts was considered as sharp as a steel trap and as bright as a pewter button.

"This joke secured me my election, for it soon circulated like smoke among my constituents, and they allowed, with one accord, that the man who could get the whip hand of Job Snelling in fair trade, could outwit Old Nick himself, and was the real grit for them in Congress. Job was by no means popular; he boasted of always being wide awake, and that any one who could take him in was free to do so, for he came from a stock that sleeping or waking had always one eye open, and the other not more than half closed. The whole family were geniuses. His father was the inventor of wooden nutmegs, by which Job said he might have made a fortune, if he had only taken out a patent and kept the business in his own hands; his mother, Patience, manufactured the first white oak pumpkin seeds of the mammoth kind, and turned a pretty penny the first season; and his aunt, Prudence, was the first to discover that corn husks, steeped in tobacco water, would make as handsome Spanish wrappers as ever came from Havana, and that oak leaves would answer all the purposes of filling, for no one could discover the difference except the man who smoked them, and then it would be too late to make a stir about it. Job, himself, bragged of having made some useful discoveries; the most profitable of which was the act of converting malagony sawdust into cayenne pepper, which he said was a profitable and safe business, for the people have been so long accustomed to having dust thrown in their eyes that there wasn't much danger of being found out.

"The way I got to the blind side of the Yankee merchant was pretty generally known before election day and the result was that my opponent might as well have whistled figs to a mile stone as attempt to beat up for votes in that district. I beat him out and out, quite back into the old year, and there was scarce enough left of him under the canvass was over to make a small grease spot. He disappeared without even leaving a mark behind, and such will be the fate of Adam Huntsman, if there is a fair fight and no gouging.

"After the election was over I sent Snelling the price of the rum, but took good care to keep the fact from the knowledge of my constituents. Job refused the money and sent me word that it did him good to be taken in occasionally, as it served to brighten his ideas; but I afterward learned that when he found out the trick that had been played upon him he put all the rum I had ordered in his bill against my opponent, who, being elated with the speeches he had made on the affairs of the nation, could not descend to examine into the particulars of a bill of the vender of rum in the small way."

In 1829 he was re-elected to Congress. The honest old "backwoods bear hunter" had won great fame among the Whigs by his course at Washington; and when in 1834 he made a tour through the North, his progress was a continued ovation from Baltimore to Boston. In Philadelphia, on his first visit he was proffered the rifle:

"I was hardly done making my bow to those gentlemen, before Mr. James M. Sanderson informed me that the young Whigs of Philadelphia had a desire to present me with a fine rifle, and had chosen him to have her made agreeably to my wishes. I told him that was an article that I knew something about, and gave him the size, weight, etc."

While he was in New York, there was considerable curiosity to witness an exhibition of his skill as a marksman, and this desire he gratified by a visit to a Jersey City range:

"I now started to Jersey City, where I found a great many gentlemen shooting rifles, at the distance of one hundred yards with a rest. One gentleman gave me his gun, and asked me to shoot. I raised up off-hand, and cut within about two inches of the center. I told him my distance was forty yards, off-hand. He loaded his gun, and we walked down to within forty yards when I fired, and was deep in the paper. I shot a second time, and did the same. Colonel Mapes then put up a quarter of a dollar in the middle of

a black spot, and asked me to shoot at it. I told him he had better mark the size of it and put his money in his pocket. He said, 'fire away.' I did so, and made sleight-of-hand work with his quarter."

Returning to Philadelphia upon the adjournment of Congress, he found the rifle ready:

"Next morning I was informed that the rifle gun which was to be presented to me by the young men of Philadelphia, was finished, and would be delivered that evening; and that a committee had been appointed to wait on me and conduct me to where I was to receive it. So, accordingly, in the evening the committee came, and I walked with them to a room nearly forment the old state house; it was crowded full, and there was a table in the center, with the gun, a tomahawk, and butcher knife, both of fine razor metal, with all the accoutrements necessary to the gun—the most beautiful I ever saw or anybody else; and I am now happy to add as good as they are handsome. My friend, John M. Sanderson, Esq., who had the whole management of getting her made, was present, and delivered the gun into my hands. Upon receiving her I addressed the company as follows:

"Gentlemen: "I receive this rifle from the young men of Philadelphia as a testimony of friendship, which I hope never to live to forget. This is a favorite article with me, and would have been my choice above all presents that could have been selected. I love a good gun, for it makes a man independent, and prepared either for war or peace."

"This rifle does honor to the gentleman that made it. I must say, long as I have been accustomed to handle a gun, I have never seen any thing that could near a comparison to her in beauty. I cannot think that ever such a rifle was made, either in this or any other country; and how, gentlemen, to express my gratitude to you for your splendid present. I am at a loss. This much, however, I will say, that myself and my sons will not forget you while we use this token of your kindness for our amusement. If it should become necessary to use her in defence of the liberty of our country, in my time, I will do as I have done before; and if the struggle should come when I am buried in the dust, I will leave her in the hands of some who will honor your present, in company with your sons, in standing for our country's rights."

"Accept my sincere thanks, therefore, gentlemen, for your valuable present—one which I will keep as a testimony of your friendship so long as I am in existence."

"I then received the gun and accoutrements, and returned to the hotel, where I made an agreement with Mr. Sanderson and Col. Pulaski to go with them the next day to the Jersey shore, at Camden, and try my gun."

"Next morning we went out. I had long been out of practice, so that I could not give her a fair trial. I shot tolerably well, and was satisfied that when we became better acquainted the fault would be mine if the varmints did not suffer."

Returning home with his gun he was greeted by many friends, who gathered around to inspect the arm:

"A large fellow stepped up and asked me why all the members did not get such guns given them. I told him I got that gun for being honest, in supporting my country, instead of bowing down and worshipping an idol. He looked at me and said, that was very strong. 'No stronger than true, my friend,' said I."

"In the course of a few days I determined to try my new gun upon the living subject. I started for a hunt, and shortly came across a fine buck. He fell at the distance of 130 steps! Not a bad shot, you will say. I say, not a bad gun either. After a little practice with her, she came up to the eye prime, and I determined to try her at the first shooting match for beef."

"As this is a novelty to most of my readers, I will endeavor to give a description of this Western amusement."

"In the latter part of summer our cattle get very fat, as the range is remarkably fine; and some one, desirous of raising money on one of his cattle, advertises that, on a particular day, and at a given place, a first-rate beef will be shot for."

"When the day comes every marksman in the neighborhood will meet at the appointed place with his gun. After the company has assembled, a subscription paper is handed round, with the following heading:

"A. B. offers a beef worth twenty dollars, to be shot for, at twenty-five cents a shot. Then the names are put down by each person, thus:

D. C.	puts in four shots.....	\$1 00
E. F.	" eight " .....	2 00
G. H.	" two " .....	0 50

"And thus it goes around, until the price is made up."

"Two persons are then selected, who have not entered for shots, to act as judges of the match. Every shot gets a board, and makes a cross in the center of his target. The shot that drives the center, or comes nearest to it, gets the hide and tallow, which is considered first choice. The next nearest gets his choice of the hindquarters; the third gets the other hind quarter; the fourth takes choice of the fore-quarters; the fifth the remaining quarter; and the sixth gets the lead in the tree against which we shoot."

"The judges stand near the tree and when a man fires they cry out, 'Who shot?' and the shooter gives in his name; and so on, till all have shot. The judges then take all the boards and go off by themselves, and decide what quarter each man has won. Sometimes one will get nearly all."

"This is one of our homely amusements—enjoyed as much by us, and perhaps more, than most of your refined entertainments. Here each man takes a part, if he pleases, and no one is excluded, unless his improper conduct renders him unfit as an associate."

"This is all that Crockett has told us about the rifle. In the latter pages of the Autobiography there are references to 'Betsy,' but this was his flint-lock, which he took to Texas, leaving the Philadelphia rifle with his elder son, John W. Crockett, from whom it has descended to the present owner. One description, that of a shooting match at Little Rock, Ark., when on his way to Texas, we quote:

"As there was considerable time to be killed, or got rid of in some way, before the dinner could be cooked, it was proposed that we should go beyond the village, and shoot at a mark, for they had heard I was a first-rate shot, and they wanted to see for themselves whether fame had not blown her trumpet a little too strong in my favor; for since she had represented 'the Government' as being a first-rate statesman, and Colonel Benton as a first-rate orator, they could not receive such reports without proper allowance, as Congress thought of the Post-office report."

"Well, I shouldered my Betsy, and she is just about as beautiful a piece as ever came out of Philadelphia, and I went out to the shooting ground, followed by all the leading

men in Little Rock, and that was a clear majority of the town, for it is remarkable that there are always more leading men in small villages than there are followers.

"I was in prime-order. My eye was as keen as a hound, and my nerves were as steady and unshaken as the political course of Henry Clay, so at it we went, the distance of a hundred yards. The principal marks-men, and such as had never been beat, led the way, and there was some pretty fair shooting. I tell you, At length it came to my turn. I squared myself, raised my beautiful Betsy to my shoulder, took deliberate aim, and smack I sent the bullet right into the center of the bullseye. "There's no mistake in Betsy," said I, in a careless sort of way, as they were all looking at the target, sort of amazed, and not at all over-pleased.

"That's a chance shot, Colonel," said a rejoiced the reputation of being the best marksman in those parts.

"Not as much chance as there was," said I, "when Dick Johnson took his dinkie for better for worse. I can do it five times out of six any day in the week." This I said in as confident a tone as "the Government" did when he protested that he forgave Colonel Benton for shooting him and he was now the best friend he had in the world. I knew it was not altogether as correct as it might be, but what man would admit of being called a "dinkie" by a fellow who would not answer no how, and "the great" and the best had set me the example that swaggers give, answer a good purpose at times.

"They now proposed that we should have a second trial, but knowing that I had nothing to gain and everything to lose, I was for backing out and fighting shy, but there was no let-off, for the cock of the village, though whipped, determined not to stay whipped, so to it again we went. They were now put upon their mettle, and they fired much better than the first time, and it was what might be called pretty sharp shooting. When it came to my turn I squared myself and turning to the prize shot I gave him a knowing nod, by way of showing my confidence, and says I, "Look out for the bullseye, stranger." I blazed away, and I wish I may be shot if I didn't miss the target. They examined it all over and could find neither hair nor bud of my bullet, when says I, "Stand aside and let me look and I will say you get on the right trail of the critter." They stood aside, and I examined the bullseye pretty particular, and at length cried out, "Here it is; there is no snakes if it hadn't followed the very track of the other." They said it was utterly impossible, but I insisted on their searching the hole, and I agreed to be stuck up as a mark myself if they did not find two bullets there. They searched for an entire section, and sure enough all came out just as I had told them, for I had picked up a bullet that had been fired and stuck it deep into the hole without anyone perceiving it. They were all perfectly satisfied that time had not made too great a flourish of trumpets when speaking of me as a marksman, and they all said they had enough of shooting for that day, and they moved that we adjourn to the tavern and liquor."

The story of Crockett's part in Texas is well known, and need not be the history of our country. Mortified by his defeat in a third campaign, he announced to his constituents a determination to "quit the States."

"I told them moreover of my services, pretty straight up and down, for a man may be allowed to speak on such subjects when others are about to forget them; and I also told them of the manner in which I had been knocked down and dragged out, and that I did not consider it right any more they could fire at me, I put the ingredients in a pretty strong I tell you, and I concluded my speech by telling them that I was done with politics for the present, and that they might all go to hell, and I would go to Texas."

Joining the Texas forces at San Antonio, Crockett was one of the devoted little band who perished at the Alamo.

"Before daybreak, on the 6th of March, the Alamo was assaulted by the whole force of the Mexican Army, commanded by Santa Anna, a person, the battle was a frightful daylight, when only six men belonging to the Texan garrison were found alive. They were instantly surrounded, and ordered by General Castillon to surrender, which they did, under a promise of his protection, finding that resistance any longer would be madness. Colonel Crockett was of the number. He stood alone in an angle of the fort, the barrel of his shattered rifle in his right hand, in his left his knee. Day in knife (trapped) and there was a frightful gash across his forehead, while around him there was a complete barrier of about twenty Mexicans, lying pell mell dead and dying. At his feet lay the dead body of that well known character designated in the Colonel's narrative by the assumed name of Thimberlig, his knife driven to the hilt in the throat of a Mexican, and his left hand clenched in his hair."

"General Castillon was brave and not cruel, and disposed to save the prisoners. He marched them up to that part of the fort where stood Santa Anna and his murderous crew. The steady, fearless step and undaunted tread of Colonel Crockett, on this occasion, together with the bold demeanor of the hardy veteran, had a powerful effect on all present. Nothing daunted he marched up boldly in front of Santa Anna, and looked him sternly in the face, while Castillon addressed "his excellency." "Sir, here are six prisoners I have taken alive, how shall I dispose of them?" Santa Anna looked at Castillon fiercely, flew into a violent rage, and replied: "Have I not told you before now to dispose of them? Why do you bring them to me?" At the same time his brave officers plunged their swords into the bosoms of their defenceless prisoners. Colonel Crockett, seeing the act of treachery, instantly sprang like a tiger at the ruffian chief, but before he could reach him a dozen swords were thrust in his back, and he fell. He fell and died without a groan, a frown on his brow, and a smile of scorn and defiance on his lips. Castillon rushed from the scene, apparently horror-struck, sought his quarters, and did not leave them for several days, and hardly spoke to Santa Anna after."

A Colorado farmer has invented a duck-hunting outfit, which discounts the California man's cow. He stripped the hide from a bullock and mounted it on a wire skeleton, which looked as natural as a living animal. He cut away the belly of his wire bullock, and put in a row of holes in the under-belly to take sight through. When he wanted a duck shot he drops his skeleton over his head and starts out for the tides. He can walk right into a flock of ducks without startling them, and has on one or two occasions returned home with his hiding place full of fat, capon-sized ducks. He felt and died all he wants when he takes his gun, for he marches into a flock and turns both barrels loose at a patent. He usually bags the whole flock. He has applied for a patent.

During the last season the Teal Club of San Francisco used 13 sacks of grain in baiting their ponds, and they killed over 4,000 ducks.

## WINTER IN THE ADIRONDACKS.

APRIL 3.—The roads are so soft we cannot get a team anywhere how long they may continue in this condition we cannot tell. To-day I put on my snow shoes to visit some traps up the brook. I only walked about a mile and a half miles, but it is further than I have walked at one time since December 1, and when I got back to the house I had to lie down. It was rather discouraging as walking has always my stronghold and a great pleasure to me. I saw many tracks of small game, and among others where a whole family of partridges had crossed the brook. I am very glad to see any sign of partridge. I was very much afraid many had been killed by the snow and cold. We have got through so far they will now be all right. We have not begun sugaring yet, and as things look now there will be no use tapping.

Yesterday the law allowed trout on the table, and we had them, there has been no fishing through the ice this winter; not a person has put a hook in the water during the close season. The ice is now thirty inches thick, and in the place where we usually get our best fishing there is from two to four feet of snow on the ice, so you can imagine how much fishing will be done. A good thaw would make the ice unsafe, as the snow or snow or top ice would go through the lower ice like hot water through a cloth.

This morning the thermometer marked two below zero, but rose to forty-six above in the middle of the day, and made more impression on the snow than any day, I could see the tops of the highest stumps sticking out. I have four men at work getting in supplies for the season, cutting wood, filling ice houses and such light work. The team has been all day on the road from Malone, and at 9 P. M. had to leave the sled with its load in the road about three miles from the house, the horses completely used up by slumping in the snow, which is still four feet deep. The sun does not waste it at all, only softens the top enough in the day time to make a hard crust at night. The deer are having a sorry time; there has been no crusting done anywhere near the lake, but I hear there has been quite a number of deer killed in the next town north of us. I visited the letter box this morning for my mail, and on my way out saw three partridges, they looked as plump as ever. The foxes continue as thick as ever, one of the men shot one on the ice in front of the house last week, the next morning I saw one near the barn.

The blue jays are now constant visitors, and last night I heard an owl. Last week old visitors, the fish crows, came back. They have nested in the swamp east of the barn every year since I came here. They always come a few days ahead of the bluebirds and robins. I shall expect to see the bluebirds as soon as there is bare ground enough for them to stand on.

April 6.—No chance to get a letter out yet. The snow is so soft a horse cannot get out to the post-office.

I wrote somewhere in the letter, I expected to see a bluebird as soon as there was bare ground enough for him to stand on. Day before yesterday the men felled a dry spruce and made a fire of the branches. It made one bare spot, and before the ashes got cold a bluebird was on hand with his song. Yesterday a robin gave us a few notes, then left, but a pair of ground sparrows have come to stay. This thaw has settled the ice on the foot, and if it had not been for four hours longer at the same rate we will be obliged to let down the top bar to get over. We can now see the board next below the top one on the barn-yard fence.

Some time ago I saw in the FOREST AND STREAM a call for information in regard to Joe Call. I have waited to see some response, but have seen none. Almost anyone in Essex county could give many points. Several members of the family now live in Jay, Essex county. One son works in the forge of the J. & J. Rogers Co. I have written to Jay asking for some facts, and if I get anything worth while will give them to the FOREST AND STREAM. I have often heard men in this section tell of his great feats of strength. Many of them seem incredible, and they are told for truth, and I think the story of Call's life would be very interesting. He certainly had a great reputation as a wrestler.

April 7.—Saw a dead trout in the lake, and a few of the men is going home, so I have a chance to send to mail. I had lots more to say to you after reading the last batch of papers.

A. R. FULLER.

MEACHAM LAKE, FRANKLIN CO., N. Y.

AN OLD HUNTER.—Phin Teepie, an old hunter of Wayne county, Penn., last fall, while about a mile from the village of Potter, was stopped in the road by a huge cougar. Having no gun, and only his dog with him, the animal was with difficulty put to flight. Knowing that the bold actions of the cat were prompted by her having some kittens near by, old Phin, who is now over seventy-five, at once made search for the youngsters, and by aid of his dog, soon discovered and secured the pair and returned home with them in his overcoat pocket. The following morning he returned to the spot with one kitten, and tying it to a bush, soon brought the old one near enough to him, which he shot dead. Phin has account of 3,500 deer he has killed in his lifetime, and a score of 400 hares, all shot with a rifle he still has, which bears the name of "Settler." Teepie remembers the time when there were elk in Wayne county, and calls to mind the last panther shot in his county in 1851, by Ed. Quick, of Blooming Grove. Since 1879, Phin has given up hunting in Wayne and Susquehanna counties, going into Potter, where game is more plentiful. There are no deer in Pike county this season than for several years past, and many have been killed. It is a pleasure to meet Phin Teepie, and we have no doubt he has as many hunting exploits to relate as had old Mat. Browning, who for forty years hunted in the central southern portion of our State and Northern Western Maryland. I shall have some unpublished account of old Browning's doings with the rifle, which will be given me by the son of an old hunter, who was at times his companion in the woods.—HOTO.

THE RETURN OF THE DEERS.—Appleton, Me., April 10. I live within stone's throw of the St. Georges River, and within a few miles of many ponds, both large and small, and so I have a good chance of seeing both ducks and geese. The first ducks were seen Friday morning, April 6, and that morning a large flock of geese went over here on their way north, the largest one seen here for several years. Since then over every day, but no one has been able to shoot one. All of the ducks seen are yet have been black ones, but those that have been shot were in poor condition. It promises to be a good season's sport.—R. R.

THE STAKED PLAIN.—Our frequent contributor, "N. A. T.," has just been over the Staked Plain, Texas, and reports game plenty: I found my old friend, the Staked Plain, literally swarming with game as I passed over it. I must have seen from the car windows 50,000 antelopes. The pay-car, which was just ahead of me, ran into a herd of buffaloes, about twenty-five miles east of the Pecos, and the driver was killed. I would not have thought that there was a man on board that car who could hit the side of a mountain at ten feet distance, but they did really kill four buffaloes. It was, however, an accident, no doubt—a mere accident. Had they known how to shoot, they might have killed a hundred. This morning I was at Red Lake, seven miles from Marietta. It covers fully 2,000 acres, and is a beautiful sheet of water. The wind was blowing strongly, and the lake sent forth a sound much like the gulf on Galveston beach, but of course not so loudly. A few hundred yards from it there is another lake of several hundred acres. Both were swarming with ducks. The water in each is pretty salty, but the cattle seem to like it. There are thousands of lakes on the Staked Plain. It is the sportsman's paradise. If I should ever come up here on a sporting expedition, I should bring with me a canvas canoe in order to take up the myriads of geese and ducks that swarm these lakes. With a canoe and a gun I could kill ducks and geese by hundreds. Without a canoe it is a mere chance if I could get at all; and if you do, you often cannot get them unless you have a dog.

FARMER AND SPORTSMAN.—East Douglas, Mass.—[I am a farmer and my lands are always open to any sportsman who deserves the name, and I do not class as sportsmen men who are guilty of the acts which, among a certain class of land-owners, has called down condemnation on the whole race of hunters. Some of them have had cause enough to make them wroth, as I have good reasons to know. How many sportsmen would bear with calmness the death or crippling of a favorite dog out of "pure cussedness"? It is not at all my idea of a man's duty to find a fine helper wounded to the death by some neighborly hunter, and carelessness of some passing hunter in leaving that fence down. Several years ago I lost a heifer in that way. Among the minor vexations the throwing down of a wall, which it will cost not a few dollars to repair, is not the least, the object usually being a rabbit worth perhaps ten cents. As your correspondent "K." says, some seem to think we have no rights that they are bound to respect. I claim to be a humble follower of Nimrod and Walton; no one better enjoys a day's sport with rod or gun than myself, but when things come to the pass that the amount of property destroyed exceeds the value of the game ten-fold, it is time to draw the line somewhere. The panther which has terrorized this section so long turns out to be a wolf; so it seems some of the persons who saw him must have drawn on their imaginations rather strongly.—AMATEUR.]

WATERFOWL IN THE NORTH.—We print the following extract from a private letter received from a friend who is living on the Upper Missouri in northern Montana. He says: "For the past ten days the snow has been melting down, and now lies on the ground at the depth of a foot or more. It has been a complete surprise to the waterfowl, which commenced to arrive about the 5th of March. The lakes and streams are again frozen over, and only the rifts on the rivers are open. I have had some good sport shooting swans and geese with the rifle, but owing to the dangerous condition of the ice, I have been obliged to get out of range of what I have killed. I carry a long fishline with me, on the end of which is tied a ball of lead; back of that, several feet apart, I have fastened on three large fishhooks. I throw the line out directly over the floating bird, draw it quickly back, one of the hooks catches on to the fowl, and I drag it ashore. Isn't this an ingenious device? I was out day before yesterday for an hour or two with an Indian, and at all times he was trying to get a 'shot' out in a good place, when five swans rose out of the river near by. With him Winchester the Indian dropped three of them before they got out of range. I do not think that waterfowl are weather prophets. I have noticed during my residence out here that they begin to arrive from the 7th and the 13th of March, and we often have severe storms later. The swans which I have killed are very fat, but the geese very poor, the breast bone being very prominent."

THE COOKING OF GREENS.—Cut off the meat from the breast, taking off the skin, and put the meat into cold water with considerable salt, and let it soak over night. Then rinse off with clean water and put it into your kettle with cold water enough to cover it; add a very small quantity of salt, and let it parboil six or eight minutes. Then pour off the water and again cover it with cold water, and add four or five small onions and a few pieces of carrots. Let the food cook slowly together until the vegetables are nearly done, then take them out and reserve some of the water for gravy. Now cut some carrots and parsnips into strips (as for julienne soup), and fry these together in butter until done. Next put a few slices of bacon into a roasting pan, placing the breasts of the grebe and vegetables over the bacon; pour in some hot water and the water previously saved and put them on the stove, and let them cook together about half an hour. Then take out your meat and vegetables (leaving the bacon in), place them on your platter and set in a warm place. Set your pan with the water and bacon in over the fire, add some Worcestershire sauce (sherry wine if you wish), thicken, and let it cook about five minutes, and then pour it over your dish of grebe, and they are ready for the table. Crab-apple or currant jelly are very good served with them.—D.

ENFORCING THE DEER LAWS.—Canton, N. Y., April 19, 1883.—At the last term of the Court of Sessions of St. Lawrence county, Chester Young, of the town of Fine, was tried and convicted for pursuing deer with dogs on the 17th day of October last. He was sentenced by the court to pay a fine of \$30 and to stand committed until the fine should be paid. The same defendant pleaded guilty to a second indictment for the same offense on the 18th day of last October, and was fined \$20. George Walker and Alonzo Green, of the same town, were indicted, tried and convicted for unlawfully killing a speckled trout, and sentenced to pay a fine of \$20 each and to stand committed until the 1st day of October next. Lenox Smith, of New York city, pleaded guilty to an indictment for killing a deer in the month of June, 1882, and was fined \$50. The authorities, in co-operation with the St. Lawrence Game Club, are securing the enforcement of the game law in this county.—L. P. H.

according to old fishermen, were against me, and had good luck. Fish are as hungry one day as another, and all you have got to do is to present something acceptable to them and they are yours, "harring accidents." Of course it is nice to go when it is fine weather, but any one fond of fishing does not wait for a day with everything just as he would like to have it.

FLACK FLACK.

### SPIRIT LAKE, IOWA.

THERE are a chain of three lakes, viz., Okoboji, East Okoboji and Spirit Lake, lying in the chain of almost boundless prairie, the altitude of the region is the highest, but even the Alleghenies and the Rocky Mountains. The waters of the Okobojies are pure and limpid, with a gravelled bottom, and abound with fish, though the greater quantities are picked, with fair black and rock bass fishing at the upper end of Spirit Lake. The lakes are fairly equipped with a flotilla of row, sail and steam pleasure craft, which, by the way, can be hired without sitting one to think he has bought the boat and then has to return it.

The town of Spirit Lake is quite a little village, situated upon the west side of East Okoboji and upon a high bluff overlooking it and Spirit Lake. There is one hotel in the town. A new hotel, just built, will be opened this summer on the isthmus, and two miles from the town.

The surrounding country is as fine chicken country as ever the heart of sportsman could wish, though in justice to the brother sportsmen we are compelled to state that last season there was a scarcity of chickens. In fact to such an extent that one was almost willing to confess it more work than sport to hunt the pinnated beauties with anything like a fair prospect of a bag. We are told, however, that the prospect for good shooting this season is better than for some seasons.

A few hours' ride over the solidly-constructed railroad owned by the B., C., R. & N. Company connects the locality with Davenport and the East via Burlington.

L. T. DORSEY.

### THE SECRETS OF SALMON GROWTH.

[CONCLUDED.]

THE Tweed has an evil omen in another direction; it has been the subject of a great deal of speculation as to the salmon river in Scotland. Some of those who dwell on the banks of Tweed and on its tributary streams have long been pre-occupied as poachers. As a deceased nobleman used to say, "not all the king's horses and all the king's men" could keep the Tweed free from poachers, who infest both sides of the river and who, not contented with taking an occasional salmon, make their greatest efforts when the salmon are on their spawning beds and in a condition the least suitable for food. No person has been able to guess the number of fish which fall a prey to the Tweed poachers. Over 200 persons are annually convicted of poaching or other offences against the Tweed Acts, and probably more than double that number escape punishment by their superior dexterity in carrying on their ignominious traffic. It would probably prove a low estimate to say there are 600 poachers on Tweed and tributaries, and that each of them on the average will bag ten salmon per annum, or 6,000 fish in the course of the year, which is, perhaps, about a fifth of the entire marketable salmon of the river. The salmon killed by poachers are, of course, all or nearly all prematurely killed. It may be assumed, without any stretch of the imagination, that every one of the poached fish would, under the natural conditions of their lives, have survived, on an average, two years longer, and they would undoubtedly have increased in money value as they increased in weight. In the face of the mortality from disease and the depredations of the poachers, it is very questionable if even 25 per cent. of the salmon hatched in the Tweed and its tributary streams ever attain to a fair degree of longevity, or are permitted, as they ought to be, to multiply their kind for a season or two. It is needless to say that a salmon is never more valuable at any period of its life than when it is engaged in repeating "the story of its birth," and to kill a gravid fish when at work on the spawning bed is a crime that is almost as heinous as the poaching of a salmon. In the most rural districts of Scotland, is no longer a "pastime" that gentlemen dare wink at, but has become a trade of the most necessary kind—a trade which must be put down with the high hand. An off-putting "excuse" of the poacher is, that birds and beasts belong to nobody—that they are here to-day and away to-morrow; but it surely stands to reason that if a purveyor here has not the property of the person who gives it room to feed and breed, no power but exercise of the powers of logic can make it out to be the property of the poacher.

Returning, however, to the main question—the growth of the salmon in all its varied stages—we come now to the fish when it is known as a grilse. The principle which regulates the growth of the parr, and admits of one-half of a hatching becoming smolts a year sooner than the other half, has, as we have indicated, never been discovered. Of the rapid growth of the smolt in the salt water, we have already offered what may be termed "staggering evidence"—evidence from which it is difficult to escape, and which, whatever we may think of it, has, at a later stage of salmon growth, been pretty well corroborated by persons whose experiments were conducted with very great care. As we have hinted, it has been asserted that a moiety of the smolts which reach the salt water do not return to the river till the following year, when they are known as spring salmon, and are assumed to have gained, during the winter, an increase in weight from 6 lbs. to 16 lbs. Indeed some naturalists have gone the length of saying that none of the smolts return from the sea in the same season as they go there, but that all of them pass a winter in the salt water. From Mr. Young, of Inverness, we obtain, in an incidental manner, the information that grilse of 4 lbs. weight are able to spawn.

The knowledge obtained by Mr. Young in the way of ascertaining the growth of salmon life has in part been already detailed; he experimented on the growth of the parr, and proved conclusively that parrs become smolts; but his chief honor, in connection with the setting up of the natural history of the salmon, lies in his having contributed a considerable amount of reliable information as to the ratio of growth of the adult fish. Mr. Young, who had at one time charge of the salmon fisheries of his Grace the Duke of Sutherland, selected for the purpose of his experiments spawned grilse, operating always upon fish of 4 lbs. weight, so as to lessen the chances of any blunder being committed. Salmon—a grilse, it is said, becomes a salmon after it has spawned—of that weight were always plentiful, and could be easily enough found on the reids after they had fulfilled the great function of their lives; before it had spawned, the se-

lected fish would probably have weighed 5 lbs. At any rate, no fish above or below 4 lbs. weight were submitted by Mr. Young to the operation of being marked. The identification of the fish was provided for by means of the insertion of rings, formed of copper wire, into certain parts of their fins, which was done in such a manner as not to hurt or inconvenience the salmon in any way whatever.

The experiments of Mr. Young were continued for several years, and always with the same result, of a great addition to the weight of animals marked. The grilse were, of course, operated upon in the fresh water; they were caught, in fact, while resting after the operation of spawning. On returning from the sea, all those which were captured exhibited a fine healthy appearance, and had acquired a large increment of flesh—the increase in their weight ranging from 5 lbs. to 20 lbs. There need be no hesitation in accepting Mr. Young's facts and figures (he was an exceedingly careful man) as proofs of the rapid growth of the adult fish, and of the verification of the accuracy of Mr. Young's methods are necessary, it is to be found in the history of the marked fish, manipulated by his Grace the late Duke of Athole, who took much interest in the rate of growth of the salmon, personally marking some of the fish, and recording the results of some remarkable instances of increase of weight. One of the most noteworthy of the Duke's experiments may be here recalled to recollection. A fish, marked by his Grace, was caught at a place forty miles from the sea, and was found to have been salt water, fed, and returned to the space of thirty-seven days. The following is the Duke's entry regarding this particular fish: "On referring to my journal, I find that I caught this fish as a kelt (spawned salmon) this year, on the 31st of March, with the rod, about two miles above Dankeld bridge, at which time it weighed exactly 10 lbs.; so that, in the short space of five weeks and two days, it had gained 14 lbs. The Duke's plan of marking was by means of tickets attached to the fin, made for the purpose, and numbered for identification, the date of each marking and capture being carefully registered for future reference.

With regard to the mode of marking young salmon, there has, from time to time, been much controversy. Harking back for a moment to the markings made at Stormontfield, it may be mentioned that on one occasion as many as 1,250 smolts were marked by cutting off the second dorsal fin; and of these marked fish, twenty-two only have been returned the same season as grilse (weight not stated), which is not, as it is observed, two per cent. of the number cut. In the following year, 1,135 were marked by means of a cut on the tail, and "a few" of these were caught as grilse; at the same time as these smolts were cut in the tail, 300 were marked by means of silver rings inserted in the fins; but not one of these was ever seen again. It is well said by one who knew a great deal of marks of the salmon than most other men—Russell, of the *Scotsman*—that no firm rule can be placed on the system of marking by cuts: "Anyone that, by examining the heaps of fish as they are tumbled from the nets, or by any other means, has had an opportunity of observing the great number and infinite variety of marks and markings, produced for the most part, it would appear, from encounters with marine enemies, will have a strong distrust of any such rule." All the marks which have been tried have each in turn been decided; and in each case the fish have been found to wit—men have been over and over again inclined to doubt the evidence of their senses. They have been asked to believe that a grilse never becomes a salmon, but remains for all time a grilse, and nothing but a grilse. This phase of the salmon question need not, however, be discussed here at present, as Russell said, in reviewing the grilse controversy, "There are men in existence who would deny their fathers." It is passing strange that the natural history of the growth of grilse into salmon, which has been disproved a hundred times, is still occasionally cited in the best arguments which sometimes occur when discussing the natural history of the salmon.

It is only right, however, to admit that many of the persons who maintain that the grilse is a distinct member of the salmon family are quite able to advance excellent reasons for their opinion, and that the general opinion of the fish as a whole is in favor of the diamond-shaped scales of the one and the oval-shaped scales of the other—as well as in the more forked cut of the tail, and differences in the number of the fin-rays, as also in its habits and the less pronounced flavor of its flesh. A fish-merchant of rare intelligence, and who is an occasional contributor to the newspapers on phases of the natural history of the salmon, says he has never had a doubt on the subject, and that a grilse never becomes a salmon, but remains all its life a grilse, and well marked member of the family; "that," he says, "is my deliberately formed opinion, after an experience of the fish extending over 40 years, during which time I have passed many thousands of them through my hands."

I have in the opinion of the present writer, there is a vast preponderance of evidence in favor of the grilse becoming a salmon, he never objects to hear an expression of opinion in favor of fact from others; and it is a fact that, on one occasion, as many as 11,000 eggs of a female salmon were fertilized by milt from a grilse—no difference of any kind being observed in the fish so long as they were under observation. This experiment was very successful; only thirty of the total number of eggs were added. The proper understanding of the natural history of the salmon is still much impeded by unsolved problems; it is a peculiar fish, able to live either in fresh or salt water. No doubt, as we have seen, the breeders of one tributary water ever found, except from misadventure, in any other affluence. Salmon, it may perhaps be set down, exist in distinct races; a Tay salmon can be easily enough distinguished from one which has been bred in Tweed.

Let us now ask, as we near the completion of our labors, how many of our salmon are spared to die a natural death; or, rather, at what period of their lives they would die of old age, if they could escape from the toils of their most intelligent enemy—man? In considering this phase of salmon river economy, we shall exclude deaths from the mysterious epidemic which has for a season or two been depopulating our rivers of some of their finest fish—*Salvelinus ferax*. It has already, we will assume, been made sufficiently clear that the greatest mortality among our salmon occurs at a stage when they are least able to fight their enemies of life in thousands. As those which live grow older, they become more able to seek their food and to contend with their enemies. Of a hundred fish under 1 lb. in weight, it is certain that about a half will be killed or die of starvation; but of a similar number who have obtained a weight of 6 lbs., two-thirds probably will live and thrive for a given period; and so, as the fish grow older and escape the perils of their

youth, their chances of life increase. The average weight of the salmon now being purveyed for table use runs from 17 lbs. to 184 lbs. The 136 fish captured by anglers in Loch Tay in the beginning of the present season (1882) averaged 194 lbs.; last year had the year before that the weight was still higher, the average being 214 lbs. The heaviest salmon captured in Loch Tay this season was 35 lbs.

Big salmon are happily nowadays not a matter of great rarity. Every season two or three of the minor masters of the deep are captured, and this year has not proved exceptional, indeed some very fine specimens have been secured. The writer personally examined, within a week after the opening of the river Tay, a dozen fish, each of which weighed more than 80 lbs.; and his opportunities of observation were confined only to one source of supply from that river. Season after season the average weight of salmon has increased, and is still increasing, although at sixteen years ago the weight of salmon commenced to decrease in a way that gave rise to some alarm, and clearly indicated that the capital stock of fish had been broken upon. At the time indicated all salmon were, so to say, being prematurely killed, the average weight having fallen to a little over 15 lbs.—so that, as a rule, the life of a salmon was at that date not a prolonged one; thirty and forty pounders had become exceedingly rare, and in those days there were no giants to delight the ichthyologists; but now we have seen, as has been shown, salmon which weighed from 80 lbs. to 184 lbs., and even heavier fish, are captured every day during the season. And we know from indications equally unmistakable that the capital stock of fish in our rivers is undoubtedly increasing—hence the number of large salmon which are recorded as being occasionally captured. It is quite true, however, that both during this season and the two which preceded it, the take of salmon was upon the whole not up to the mark, but this probably resulted from causes other than the scarcity of fish; upon a late occasion we personally saw, in the course of about twenty hours, some fine fish ascending to the upper waters of Tay, not one of which would be less than 20 lbs. in weight. That was after the nets had been taken off the river; and an old fisherman with whom we conversed assured us that there was always a fine run of fish as soon as the close time began, "just for all the world as if the salmon had waited till the way was clear for them."

No official statistics of the number of salmon which are annually caught in rivers of the United Kingdom are taken, but from the number of boxes of these fish which in the season are sent from Scotland to Billingsgate, a pretty good guess can be made of the total salmon production of the land of "the provident hand the flood." Thus, in 1881, including fish from the Tweed, there reached the great wholesale house of London 25,724 boxes of salmon, each box of fish weighing 13 lbs., and the net wholesale average of one shifting her pound weight, the sum of money paid by London to Scotland in 1881 for its venison of the waters would amount to £192,930; and taking it for granted that our home consumption of salmon would be equal to about 8,000 boxes, a sum of £400,000 would thereby be added, making a total of £292,930 as the annual value of our Scottish salmon fisheries, from which have to be deducted the wages, wear and tear of fishing-gear, and profits to lessees of fishing stations, before the net result can be struck. The price of a shilling per pound weight, which we have quoted, is probably too low, as at certain seasons of the year salmon in London brings from half-a-crown to seven shillings a pound weight. The salmon rental of Scotland, while it is undoubtedly more than double that of England, is certainly not half that of France, as the latter country exports more than 100,000 salmon annually, and the value of the salmon exported every year from Ireland is over half a million of pounds sterling. From these figures it will be obvious that, if by some means we could add a few pounds to the average weight of our fish, it would tend to largely increase the money value of our salmon supply. Assuming it to be possible that four pounds could be added all round to the marketable fish, that would, at the wholesale rate of a shilling per pound, add 40 per cent. to the price of each fish, and at a rough guess, increase the value of our Scottish salmon supply more than £200,000 per annum.

And now to conclude. If the writer were to be asked to say, "on soul and conscience," how old the 50-lb. fish was which was captured this season in the river Tay, he would be loath to commit himself to an opinion, even after thirty years' experience of the fish of the salmon kind both on Tay and Tweed. It is out of the question, of course, to attend on other than the fish, that there exists a plentiful supply of figures with which to prove anything about that fish that wants proof! We have already given figures to show that salmon grow at the rate of at least five pounds a season, and that is a rate of growth which we have always found practical fishermen ready to admit. There comes, however, a period in its life, we believe, at which growth either altogether ceases, or becomes greatly slower than the rate of increase which is incidental to the early years of its life. Will there be any salmon over twelve years of age? We once handled an 80-lb. fish, but it bore upon it no mark by which we could find out its age; it might, for all that we could see by a careful examination, be twenty years old, or it might only be ten. It will be not a little curious if the problem of salmon growth should ultimately be settled at the antipodes. The salmon has been acclimatized in our Australian colonies. The date of its introduction into those colonies is well known, so that when a large fish shall be caught, there will be almost no doubt as to its age. The salmon, we are told by some experts in fishery economy, never adds to its growth while it inhabits the fresh water—it is in the sea it finds its productive feeding-ground; it is in the great deep it puts on its annual increments of flesh—"cleads its bones," as James Hogg used to say, and increases in size and greatly enhanced in value. Upon one occasion, when we handled a 33-lb. Tay salmon that had just been netted, we put the question to its captor, an old fisherman, "What do you think its age will be?" and he replied without any hesitation, "I would say, sir, that she's a six-year-old, if she's a day." There is every probability that his estimate was a correct one, and having given his reply, we shall, for the present, take leave of the salmon as an object of natural history.

\* At the close of the present season, a 50-pounder was taken in the Tay (by net); and more than one specimen weighed 45 lbs. was captured in that river. But the date of its capture was not ascertained. One of the Tay salmon which weighed respectively 70 lbs. and 55 lbs.; but these are all dwarfed by a giant of the salmon kind which was captured in the Tay last year. It was a fish which weighed 184 lbs. This fish was exhibited two years ago in Glasgow by a fish merchant of that city, and was seen and handled by the writer of this note.

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$1 A YEAR. 10 CTS. A COPY.  
SIX MONTHS, 50 CTS.

NEW YORK, MAY 3, 1888.

VOL. XX.—No. 14.  
Nos. 39 & 40 PARK ROW, NEW YORK.

## CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

## SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C. London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

## ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications.

## INDEFINITE CONDITIONS.

IN the management of the British interests in the International match Maj. Scriven has replaced Maj. Waller as secretary of the special committee having charge of the matter. With this change come intimations of a possibility of misunderstanding as to the exact terms of the match, and it is particularly unfortunate that in all the cloud of correspondence which has been going on back and forth for some time past between the two associations, no one should have taken the simple precaution of writing out the conditions of the match, and by an exchange of copies fix definitely the basis upon which the contest was to be fought. In the pettiest nether match the exact conditions under which each contestant shoots his string of shots is carefully laid down, but when an important match like the International contest is brought up, there are a lot of complementary generalities, and when a practical point in shooting is touched, the fact comes out that these hazy rules and regulations which are supposed to govern the match may mean anything or nothing.

In 1882 there were concessions on both sides. When the British team men reached here they found the Americans with pistol grip rifles, having sights which, while they were not fine enough to be styled match sights, were a great remove from a military model. The conditions of the match had been doubly at fault in failing to bar out what should not be allowed, and in omitting to specify, exactly and beyond question, what was to be permitted in the match. There had not been enough of knowledge on each side of what the other side was doing in the way of improving the military rifle. The British arms came as revelations to the American marksmen, and only the presumption which ignorance inspires could have led the Americans to hope for a victory under the circumstances.

It is an open question whether a victory was ever really expected or worked for. It is pretty certain that something very close to an assurance of winning had to be

held out to induce the British team to cross the ocean. Among the other pleasantries proffered the visitors was a well-arranged opportunity of breaking the line of American victories before the butts. The previous contests had been managed by the riflemen. The men who shot the match had control of the preliminaries, and did not go into the battle with anything like the overwhelming handicap which weighted down the gallant twelve who fought the match of September, 1882. With the end of that match came a demand that some chance be left open for a victory which Americans might hope to win if they worked for it in 1883. Changes in the rear and front sights were asked for, and also a modification as to the date of enlistment of men who might take part in the match.

Readers of the FOREST AND STREAM are familiar with the application of the American Board of Directors for a modification of the conditions and the reply of the British Committee. Secretary Seabury, for the American riflemen, asked for "the use of the wind-gauge," and Sir Henry Hallford suggested "that the wind-gauge on the back sight, which is likely to be adopted by our regular army, be permitted hereafter in all military breech-loading matches at Wimbledon." Now comes up a cloud of doubt as to the interpretation of what a wind-gauge really is. Shall it be an accurately graduated sight capable of the finest sealings, or shall it be some sort of a sliding cross-bar which is set with a push over and held only by the friction of the parts? The British council have been great sticklers for what they term a "service" arm, which means generally, when it is defined, a weapon which in some way has found favor in the eyes of the British army or volunteers. While the council were preparing the conditions of the match of 1882 it meant a rifle with a fixed rear sight so far as any lateral motion was concerned, though for years before the New York State model arm, and the arms sent out from the Springfield Armory, bore rear sights which could be shifted for wind by the turn of a screw. The same board which declared the thin barley-corn front sight of the American rifle did not come within their notion of a service arm, are ready to accept a rear wind-gauge which is nothing more than a bar held to the uprights by the pressure of a spring.

Suppose such an arm should fall on the ground, the heavy iron front sight would possibly get latticed, while the unstable wind-gauge would be pretty certain to slip out of position, whereas the thin steel foresight of the American arm would stand any amount of ill-usage, while the rear sight once set by a turn of the screw remains so until changed by the hand of the rifeman.

The fact is that the service arm of the future is to be something far nearer the match rifle than the snap-shooting weapons which have formerly made such noise in the hands of troops. At present there is no fixed standard. Surely the arms used at the last match will not be placed under that heading, for they were mere target appliances made to provoke bulleseyes over certain known ranges, fitted with ammunition which would not bear the rough transport of an active campaign, and in many minor respects far different from what an experienced army officer would select to put into the hands of the general run of soldiers. The use of such a shifting term as "service arm" is sufficient to keep the conditions of any match in an unsettled state, for the service arm of to-day may be the discarded arm of to-morrow.

## A MOMENTOUS QUESTION.

LAST March the Litchfield, Conn., *Enquirer* published the following:

We hear a curious law point discussed. A man was driving across our lake recently, near where some holes had been cut and lines fixed by a fisherman. He noticed that there was a bite at one of the hooks, sprang out, pulled in a three and a half pound fish, hung it into his sleigh, and was off before the fisherman could reach him. Was it a theft; or, in other words, to whom did that fish belong? It seems probable that it belonged to the man who pulled it out, for the rule about game—fish, flesh, or fowl—is that it belongs to whoever actually gets possession of it, and to no one till in his actual possession. Pretty sharp practice, though.

The way in which the case is put renders it doubtful to whom the fish legally belongs. Legal right is often the reverse of moral right. If the fish legally belonged to the traveler in the sleigh who pulled it out, then a bird killed by a sportsman but not yet picked up will belong to the one who may grab it first, even though the shooter has advanced to it and is bending over to reach it. We know of many men who, while not qualified to administer law, would substitute justice in the case of a man trying to claim their game which, according to the code, has not yet been reduced to possession, by being placed in the bag. We probably know a thousand such men, and it would be worth a journey to see the man

ner in which they received a person who claimed their game between the shooting and the retrieving of it.

Anglers, as a class, have the reputation of being more gentle than other people, whether so or not the Census Bureau has no definite information, but we think we may possibly know a score or so of the contemplative fraternity who would not feel their blood flow faster at the sight of a man taking a three-pounder off their line, and if, near to him, something might drop, perhaps the fish alone, perhaps more than the fish.

The *Enquirer* asks, "Was it theft?" This we cannot answer. The man might have only borrowed the fish for scientific purposes, such as to learn how long it would take to boil it, or to find out what sauce was best with it. It might have been a fish that stole a hook from him last summer and he only wished to see if the hook was there yet, or it might have been a fish that had been taking off his young ducks; we cannot say. All these things would have to be fairly presented before a correct decision could be arrived at.

We notice the absence of a most important element in this case. We have only the bare fact that one man cut a hole in the ice and put in a hook, no line being mentioned, and that a passer by noticed a bite on the hook and pulled in a fish and drove rapidly off. The person who reported the case probably saw it from a distance through a telescope, for there is no record of any conversation. The failure to give the remarks of the fisherman is fatal to a correct understanding of the case. His views might have been expressed in few words, or at length, but what he said on that important occasion has been lost. We should have been pleased to have heard him sum up. What did the fisherman say?

## GUIDES AND TOURISTS.

THE relation of his experiences in the Adirondacks by "Piseco" is timely. He bewails the decadence of morals and manners among a certain class of guides, and the existence of a most pernicious system whereby the "hotel guides" bleed the unfortunate tourist who falls into their clutches. "Piseco" is undeniably right in his censures of this class of so-called guides.

It is equally true that the particular class of Adirondack tourists who support these "hotel guides" is a very different class from that of the old-time tourists, who could appreciate a genuine guide's services. It must be remembered that the majority of visitors to the Adirondacks are not sportsmen, in any good or bad sense of the term. Most of them are mere pleasure-seekers with no aspirations to anything other than idling away their time in the beaten round of summer hotel life. If the old guides have degenerated, or been superseded by a new class of designing flunkies, no one is more to blame for this than the summer tourist who has created the change. The greenhorn, who rigs himself out in buckskin toggery, with a feather flying in his scalp lock, does not want one of the genuine old-time guides, nor would one of those honest woodsmen care to serve him. The cockney generally has more money than brains, and dispenses the first liberally to conceal his lack of the second. He wants to be put out to the spring holes and to have his fish hooked and "hailed in" for him, and for this he is content to pay whatever the attendant may ask.

There is another class of men who visit the Adirondacks. They hire all the guides in a district, pay them four or five times as much as their services are actually worth, and often add liberal presents. Mr. H. Polhemus, of Brooklyn, is reputed to have given one of his guides \$1200 as a gratuity. These men employ a big force, pay big wages, secure a big slaughter, and have the satisfaction of a big brag. No wonder "Piseco" claims that the guides are demoralized. They are but human after all, and the same rule must hold good in the woods that obtains elsewhere; men who are paid extravagantly by rich men will not do the same work for other men for honest wages.

There are yet, however, as our correspondent is careful to say, many good guides in the Adirondacks. We have found that the Brown's Tract men are, as a rule, intelligent and trustworthy. They are alive to the necessity of proper game and fish protection and propagation. They are coming to understand that when the deer and trout go, their own occupation must go, too; and so they refuse the demands of the cockneys to be led to game out of season. The Brown's Tract guides have lately clubbed together, and have sent one of their number, John L. Brinkerhoff, down to the Cold Spring hatchery for land-locked salmon with which to stock Fulton Chain. The Brown Tract region is more difficult of access than some of the other Adirondack resorts,

knowledge of woods life and of congenial tastes, and share with them in the heart of the woods the labor and rest, the loneliness and quiet which are incident to camp life, and which form guides of its charms.

These guides should realize that in permitting these boatmen to compete with them on even terms they do themselves injustice.

The woods landlords should realize that in sustaining the extortions of these boatmen they do it at the expense of their own interests, for a large majority of those who now visit the woods care little for hunting or fishing, but who appreciate the delightful climate, the indescribable sensation of rest and freedom from annoyance of all kinds, which they best realize while lounging on the wide, shaded piazzas with books and cards or chess, and with ladies the occupation of fancy work, and for children the croquet, and all are contented to let the hot-looking lake alone during the day and spend their time in the cool woods gathering mosses and ferns.

Toward evening though, nearly all would enjoy a row. Two hours a day would cover the average need for this, and thus complete each day with another pleasure. But as I have shown this pleasure is denied them, unless, indeed, they are willing to submit to extortion, and to pay a man daily a big day's wages for doing nothing but to lie around the guides' camp smoking pipe.

There are some very pleasant places that I know of where the landlords have broken clear of this system. At Fletcher's, on Lake Lake; at Paul Smith's, on St. Regis; at Rude's, on Lake Piseco; at Andrews and Sturgis's, on Lake Pleasant, a boat or boatman can be hired for such periods as are desired.

Undoubtedly there are other places, and I would be glad if the list were increased, for by seeing from my list of available places noticed that I failed to get what I wished unless I paid for what I neither wished nor got, I have reduced my resources.

I hope that in this rather hastily written paper I have succeeded in making it clear that I fully approve of paying a real guide full wages, and believe that he more than earns them, and that my growl is at those only who, claiming to be guides, are paid as such for little or no guide service. My views in regard to a number of matters connected with this subject were very fully given in a letter published by you in July, 1876. If you will glance over that you may think it worth while in this connection to republish some of its statements upon which I based an argument that if the guides could be made game constables and protectors, many of the present evils would be diminished. PRESCO.

## INDIAN FOLK-LORE.

[The following stories have been collected during a residence of some years among Indians who have not yet come into contact with any whites with the exception of the servants of the Hudson's Bay Company, so that these legends may fairly be considered to be free from the taint of civilization and to represent Indian stories in their primitive state. The first is a story of a man who, in accordance with the animals common to the country, especially as to the origin of anything peculiar as to size or markings on them. Animals having the gift of speech seem common both to stories of this continent and to the East, witness various stories in the "Arabian Nights' Entertainments," where animals have this power. I have taken great care to make no additions to the original, but to leave them as they were told to me. Many of them have almost a familiar look, such as the Climbing Boy, which certainly has some likeness to Jack and the Beanstalk, and the story of the Mesquito to the Roc in Sindbad the Sailor.]

### II.—The Climbing Boy.

A BOY and his two sisters lived together in a tent. One day the boy went hunting, as usual, and seeing a squirrel, he shot an arrow at it, but the arrow stuck in the tree. The boy climbed up after it, and when he came near he blew it to shake it down, but the arrow went higher up. So he climbed again and blew, but it went still higher. This lasted some hours, when he found himself able to step on to firm ground, covered with squirrel tracks and marks of all kinds of animals. After staying there some days, he returned to his sisters and told them what he had discovered. They agreed to go to his new country with him and determined to live with him. When they had packed up their things, he made his sisters go up first, telling them when they came near the arrow to blow it. This they did; and in time reached the country, where they built a tent. He hunted all day and never the game was scarce. Soon he had collected enough squirrel skins for a coat, which his sisters made for him. The first day he put it on and walked away from the tent until he came to a path in the snow. When he laid himself right across the track. After he had lain there some time he saw a great, fiery wheel rolling along the path toward him, but he would not move, so the sun stopped and asked him to get out of the way, but he said he should not, when the sun rolled right over him, burning his new coat, which made him very angry. He shouted to him that he would be revenged. When he got back to his tent he had his sisters make him lines of sinew, with which he made a snare right across the path. After a time it came quite dark, when he cried out, "I have done it, I have done it." His sisters asked him what he had done. He said, "Made it dark." But he found that he would be obliged to let the sun go, for he could not see to hunt. He found on trying to release him that he burned his fingers. Then he asked the animals to help him; but they found it too hot work. At last the mouse managed to gnaw away the snare, but in doing so burned his nose. After this he lived in the sun for a long time, and married his sisters and peopled the country.

### IV.—The Beaver Wife.

A man wanted a wife, so he looked about for one to please him, but could not find one among all the girls he knew. One day he met one called The Beaver. She had lovely teeth; this he was much pleased with, and he wanted her to marry him. He went to her father and asked him for his daughter, and was told that he might marry her if he liked, but that if he did he would have a lot of trouble; and the father refused to part with her unless the suitor promised to make a bridge across every stream he came to for her to pass dry-footed. This the suitor promised to do. He married the girl and lived very comfortably with her for two years, when he went as usual, leaving his wife to make a bridge over every stream, as usual, he made bridges over all the creeks he came to. At last he came to a dry one. Over this he made no bridge, but walked on for about a mile, where he hung up his bag to show where he wished the camp to be made. He then went on and made his snares. It rained while he was doing so, and he returned early expecting to find the camp. But when he came to the

place, there was his bag but no camp. Going back to look for his wife, he came to the creek which had been dry in the morning, but was full of water; and what astonished him more was that a large beaver house was built that he had not noticed before. He then determined to break it, but while he was trying to break in, he heard his wife's voice inside telling him to go away, for his neglect to put up a bridge had changed her into a beaver. He tried many times to take the house, but always failed. His goodness cost him his wife and his two children.

MOOSE FACTORY, Hudson's Bay, British America.

## RIPARIAN RIGHTS.

New York, April 30, 1883.

Editor Forest and Stream:

The season for salmon angling is at hand, and in view of the recent decision as to riparian rights in the Exchequer Court of Canada, and more recently confirmed by the Court of Appeals, also in the "Fox River" case, in the Supreme Court of Illinois, the following extracts from these decisions may be of service in preventing disputes as to such rights by many parties not cognizant thereof.

AS OLD ANGLES.

In the Exchequer Court of Canada, Christian A. Robertson and the Queen. Judgment by the Hon. Mr. Justice Gwynne:

Page 10.—"The public have merely the right to use the river for passing to and from upon it, in the same manner as they have a right of passage along a public road or foot-path through a private estate, but the right of fishing in such a river by the riparian proprietors is a right of property vested in such proprietors in virtue of their being seised of the 'Alicene' of the stream 'ad medium filium aque' (to the middle thread of the water), which *prima facie* all proprietors of land adjoining an inland river are. 'Riparian proprietors' is a term applied by the civilians to the owners of watercourses, and the use of the same significant and convenient term is more fully introduced into the common law, the soil of the bed itself, and consequently the water, may be, and most often is, divided between two opposite riparian owners; that is, the land on one side may be owned by one person and the land on the opposite side by another. When such is the case each proprietor owns to the middle, or what is called the *thread of the river*."

Page 11.—Audi Hale, "Jure Maris, p. 5 of Hengram's tracts," says, "Fresh water rivers, of what kind soever, do of common right belong to the owner of the soil adjacent, so that the owners of one side have of common right the property, that is, the property of the soil and consequently the right of fishing, 'aque ad filium aque,' and the owner of the other side, the right of soil or ownership and fishing unto the 'filium aque' on their side."

Chancellor Rush in his commentaries says: "It was a settled principle of the common law that the owners of lands on the banks of fresh water rivers, above the ebbing and flowing of the tide, and the exclusive right of fishing as well as the rights of property opposite their respective lands 'ad medium filium aque,' and when the land on each side of the river belonged to the same person he had the same exclusive right of fishing in the whole river, as far as his land extended along the same. The right exists in the river of that description, though they be of the first magnitude and navigable for rafts or boats, but they are subject to the 'jus publicum' as a common right of use or current."

Page 15.—"Crown grants of land adjacent to rivers above the ebb and flow of the tide are presumed to convey to the grantee the bed or soil of the river, and so to convey the exclusive right of fishing therein to the middle thread of the river opposite to the adjacent land so granted."

"When the exclusive rights of fishing does not already exist by law, consisting of ungranted lands, no exclusive rights of fishing could be legally established by any person."

And in the Fox River case, FOREST AND STREAM April 5, page 193:

"Where such proprietor owns the land on one side only of the stream, his right to the land and to the use of the water, whether used as a power to operate mills and machinery, or merely as a fishery, extends only to the middle thread of the stream as at common law."

### THE STATE OF OHIO vs. JNO. SHANNON.

Syllabus.—Under Section 33, Chap. 8, Title 1, of the Crimes Act of May 5, 1877, it is unlawful to shoot at, or kill wild ducks on the lands of another person, although within the channel of a navigable river, when the offense is set up in a conspicuous place on the shore, "a board inscribed in legible English characters, thus, 'No shooting or hunting allowed on these premises.'"

Exceptions to the Court of Common Pleas of Sandusky county.

Shannon was arrested on a warrant issued by a Justice of the Peace of Sandusky county on complaint of George G. Tindall, charging a violation of Section 33, Chap. 8, Title 1, of the Crimes Act of May 5, 1877. The section provided:

"Whoever, having received verbal or written notice from an owner of inclosed and improved lands, or any lands the boundaries of which are defined by stakes, posts, water courses, ditches, or marked trees, his agent, or a person in charge thereof, not to hunt thereon, shoots at, kills or pursues with such intent on such lands, any of the birds or game mentioned in Sections 27, 28 and 30 of this chapter, or whoever shoots at, kills or pursues with such intent any of such birds or game on the lands of another upon which there is set up in some conspicuous place, a board inscribed in legible English characters, thus, 'No shooting or hunting allowed on these premises,' or pulls down or defaces any such board, or the letters thereon, shall be fined," etc.

Among the birds or game mentioned in said Section 27, are "wild ducks," and the complaint charged Shannon with shooting and killing wild ducks on the land of Tindall, situated in said county, etc.

Shannon, having been bound to appear and answer said charge in the Probate Court, was there tried, convicted and sentenced. On the trial, a bill of exceptions containing all the testimony was taken, and upon proceedings in error, in the Court of Common Pleas, said judgment was reversed. To this judgment of reversal the Prosecuting Attorney, under Sections 38 and 39, Chapter 8, Title 2, said he took exceptions, and the same are now submitted to this court.

The uncontradicted facts appearing in the Bill of Exceptions are, in brief:

That Tindall was owner and in possession of a tract of land in said county bounded on one side by the Sandusky River, a navigable stream;

That Shannon on the 29th of October, 1877, when the killing of wild ducks was not prohibited by statute, was in a

skiff on the Sandusky River, between the middle thereof and the shore owned by said Tindall, from which position he shot and killed wild ducks swimming in and flying over the water between said shore and middle of the river;

That boards inscribed in legible English characters "No shooting or hunting allowed on these premises" were set up in conspicuous places on said shore;

And that Shannon had been duly notified by Tindall not to shoot or hunt on his lands.

It also appears, that the position occupied by Shannon on the river was within the limits of navigation as used by boats and other water craft engaged in commerce;

And also, that the public generally had been accustomed to fish, and kill wild ducks, in the same location, in and upon the river.

Upon this state of facts the State of Ohio seeks the opinion of this court, and the Court of Common Pleas err in reversing the judgment of the Probate Court.

John M. Lennon, Counsel for the State.  
Everett & Fowler, Attorneys for Shannon.

McIlvaine, C. J. This cause and June vs. Purcell, decided at this term and reported ante, having a question in common, were considered together. In that case it was held, that the title of a riparian owner of land bounded by a navigable stream in this State, extends to the middle or thread of the stream.

It follows upon the principle announced in that case, that the locus of the offense alleged in this, though upon the surface of a navigable stream, was within the boundaries of Tindall's land, and was embraced in the literal meaning of the notice, "No shooting or hunting allowed on these premises."

It is true, however, that the right of Tindall to so much of his land as was covered by the waters of the Sandusky River, the same being a navigable stream, was not exclusive, but subject to the right of the people to use the same as a highway, so that the entry of Shannon within the bounds of Tindall's premises, to wit: within the limits of this public highway, did not, *per se*, make him a trespasser; and clearly, an action against him for trespass, *quare clausum fregit*, could not be maintained.

Hence it was claimed by defendant, that his conviction was wrong, because, as is claimed, this section of the statute applies only to persons who wrongfully break and enter the close of another contrary to his expressed will.

The provisions of the statute were not intended to punish trespassers *quare clausum fregit*, merely because they have been guilty of a trespass; but were intended to punish the act of killing, shooting at, or pursuing game on the lands of another, against which notice may have been given as provided in the statute; so that a person rightfully on the premises of another may commit the unlawful act, as well as one who commits a trespass by entering upon the premises.

It seems to us, that whatever change this statute may have made in respect to the law in relation to trespass on real property, the main purpose of the Legislature was to confer upon the owner of land within this State the exclusive right to hunt and kill the designated game upon his own premises, and to protect him in such right, provided he complies with the prescribed conditions in regard to notice.

And with regard to notice, if the lands be "inclosed and improved," or if the boundaries be "defined by stakes, posts, water courses, ditches or marked trees," verbal or written notice "not to hunt thereon" will bring the offender under the operation of the statute.

When a water course, for instance a navigable stream, continues a boundary, it is the opinion of a majority of the court, that all persons who have received verbal or written notice not to hunt upon the lands of the owner, are bound to take notice that his land extends to the middle of the water-course, if such be a fact.

But if the lands be not "inclosed and improved," or if they be not "defined by stakes, posts, water courses, ditches or marked trees," as they are in this case, where the owner may bring himself and his lands within the protection of the statute by setting up in some conspicuous place thereon, "a board inscribed in legible English characters, thus, 'No shooting or hunting allowed on these premises.'"

And in such cases, all persons engaged in shooting at, killing or pursuing the designated game, must take notice not only of the statute, but of the setting up of such board, and also of the extent or boundary of the lands on which the same is set up. And in respect to this notice, it makes no difference whether the land or any part thereof be covered by water or not.

It is claimed, however, that this statute was not intended to protect lands covered by the water of a navigable river.

A majority of the court can see no grounds upon which lands covered by navigable streams should be excluded. They are as much the subject of private ownership as innavigable streams. There is no distinction made by the terms of the statute.

True, navigable streams in this State are declared to be public highways; but the right to use a public highway is not abridged by protecting the owner of the fee in the exclusive right of killing game therein. Travel and commerce are not thereby hindered.

And as the power of the Legislature to protect game, or the exclusive right of the owner of land to kill the same on his own premises, is as ample over land covered by water, whether navigable or innavigable, as it is over dry land, and as there is no attempt to distinguish between them in this statute, we must hold that all alike are within the protection of this statute.

Exceptions sustained.  
White, J., did not concur.

I. E. L. DeWitt, Reporter of the Supreme Court of Ohio, do hereby certify that the foregoing is a true and correct copy of the syllabus, statement of facts and opinion of said Court, as announced by the Chief Justice in the case of the State of Ohio vs. John Shannon, and is as the same shall appear in Vol. 36, Ohio State Reports.—E. L. DeWitt, Reporter Supreme Court of Ohio.

THE NEW HAMPSHIRE LEAGUE.—At the annual meeting of the Fish and Game League the following officers were elected for the current year: President, John B. Clarke; Secretary, Chas. L. Richardson; Treasurer, Frederick Smyth; Vice-presidents, Marcellus Eldridge, Portsmouth; Luther Hayes, Milton; E. B. Hodge, Plymouth; W. A. Fletcher, Concord; V. C. Gilman, Nashua; W. H. Shurtleff, Colebrook; John Clement, Troy; Gilbert P. Whitman, Manchester; Herbert P. Norris, Manchester; G. V. Pickering, Laconia. The annual address was delivered by Hon. Jos. B. Walker, his subject being "The Forest and Game of Hampshire." Several essays were read; we print them elsewhere.

## AN ANGLER'S NOOD.

HERE by woods dusky shadows cling,  
Here bird notes through dim arches ring.  
While each musician seems to sing  
With joy, yet still unseen.  
With drops of molten silver bright,  
As clear as air, as dark as night,  
First calm, and then in sudden flight.  
See there the streamlets sleet.

The brown leaves carpet all the ground,  
By zephyrs stirred, their rustlings sound.  
The gray moss hangs from all around,  
Eternal without lull.  
Of red one sees a ruddy gleam,  
Where swamp-pinks in the sunshine dream,  
Reflected in the rushing stream  
A five amid the flood.

There down the dancing waters whirl,  
Swift o'er the rocks with sudden swirl,  
And in the pool below they part  
A naiad's ear to charm.

As 'tis a sylvan scene so sweet,  
That all the sounds and sights which greet,  
The one who comes with loving feet,  
Would darkest thoughts disarm.

'Tis here the angler loves to stand,  
With watchful eye and steady hand,  
Till skill at last brings rods to land  
The monarch of the brook.  
In vain the victim strives to hide  
In some cool cavern in the side  
See there! his scarlet-spotted side  
Comes glancing from the nook.

And he feels his pulvis stir  
To hear the woodcock's startled whirr.  
As feeding in a group of five,  
He springs in sudden flight.

And to the angler wandering here,  
In grottoes where lights green appear,  
There comes the dim, primeval fear  
Of loneliness and night.

As toiling pilgrims lift their eyes  
To where tall Mecca's towers arise;  
Or seamen wonder the tempest tries  
Sigh for a South Sea isle—  
So memory paints the place he craves,  
As life's long busy cares he braves,  
And dreary in his mind engraves  
His shroud with magic style.

L. V. P.

## Natural History.

## NOTES ON THE STICKFISH.

Verrill &amp; Blake, Stearns.

THE history of the discovery of this singular polyp is this: As early as 1868, or at least 1869, a Portuguese fisherman, by name Joseph Silva, who was at that time engaged in fishing for dogfish at Burrard Inlet, British Columbia, and the neighboring waters, brought some of the sticks to the saw-mills at Burrard Inlet as a curiosity. Being a new thing they attracted considerable attention, but as there was no one there resident of a very scientific turn of mind, no special means were taken to have them identified, and it was a matter of doubt as to whether they belonged to the animal or vegetable kingdom.

Although living at Burrard Inlet at that time, and seeing the first specimens brought there, I did not take any measures for their identification, as at that time I was not in communication with any scientific institution or natural history periodical. Some time subsequently, Mr. George Dietz, the resident partner of the firm of Moody, Dietz & Nelson, mill owners at Burrard Inlet, sent some of the "sticks" to Mr. F. G. Claudet, the chief assayer of the Government assay office, at New Westminster, a chemist of more than ordinary ability, who pronounced them to be largely composed of phosphate of lime. This set at rest the question as to which kingdom they belonged, and shortly afterward Mr. Dietz sent some of the "sticks" to the Academy of Natural Sciences at San Francisco, California, which led to their being placed before scientists in various parts of the world. There was some difference of opinion as to what they really were, some supposing them to be a species of gigantic sea pen, while many disciples of Darwin thought the connecting link between the animal and vegetable kingdom was at last obtained. Numerous inquiries were made from various places for information respecting them, and requests made for specimens. Many specimens of the complete animal were sent to various scientific establishments, put up in different essential, alcoholic and other preparations, but none of these, I believe, reached their destination in good order, the happy medium for strength of the preparations not being arrived at, and in consequence some specimens in strong preparations were dissolved, while other weaker ones did not succeed in preserving the tissues. A Captain Lawson, of the United States Coast Survey Service, then stationed on Puget Sound, Washington Territory, applied to me through a friend of his and mine in Victoria, to obtain specimens, have them put up in a tin tube, and the tube then filled with glycerine, which he was of the opinion would answer the purpose of preserving them for transmission to California.

I caused the specimens asked for, some five or six in number, if I recollect rightly, to be put up in the tube, and eighteen pounds of glycerine was required to fill up the empty space; the tube was then sealed up, and forwarded to Capt. Lawson, and was by him sent to some scientist for identification. I was afterwards informed that the specimens arrived in perfect order, were classified, and received the present double name in honor of Prof. Verrill, of Yale College, and Dr. Blake, of San Francisco. As notes were not made at the time, dates, of course, must be approximate only, but they are as accurate as a person can reasonably be supposed to give after such a lapse of time as fourteen or fifteen years.

Now, as regards the animal or animals, so to speak, with out going into a scientific description, which I confess I am unable to do, perhaps a few remarks concerning them may be of interest in connection with the foregoing statement.

They are caught only at Burrard Inlet and vicinity, as far as is at present known, although the entire coast has been

fairly prospected by parties fishing for dogfish, from Queen Charlotte's Sound to Olympia, at the head of Puget Sound. The dog-fishermen are the only ones who do or would be likely to catch the animals, and they have only found them in this one locality. So far as can be ascertained, no other place produces them, and did they exist elsewhere, they would have probably been procured ere this.

Their mode of capture is in this wise: The gear for dog-fishing is a line or rope resembling the ordinary clothes line in size, of a mile or more in length, with pieces of cod line attached every two feet, or thereabouts, to which are fastened codfish hooks. The main line is anchored at both ends, and the fisherman takes a large skiff kept under running in taking off the dogfish, and rebaiting the hooks. When he has reached one end, he turns around and under runs to the other. The dogfish, in their endeavors to get loose after being caught, entangle the line about the stickfish, and the latter is brought to the surface when the line is lifted.

All circumstances seem to justify the idea or view that the stickfish, having no locomotive functions, are attached to the bottom. The fact that they are found at both ends of a very limited area, confirms this belief, for if they were detached, the strong tides prevailing where they are found, would necessarily disperse them over a greater space than they are known to occupy. Other circumstances seem to indicate that the stickfish in its normal state assumes an erect or vertical position, and not a horizontal one. For the dogfish, if the natural position of the polyp were a horizontal one, would be obliged, in order to entangle the lines about it, to swim under and over the stickfish, while if the position is an erect one, the same effect would be produced by swimming around it, which is more likely to be done. The large bulbous appearance of one end of the stickfish makes it seem likely that it is imbedded in the bottom, which is always of a sandy nature, and the belief that were it not so planted it would be of wider distribution, is not at all unreasonable.

Another feature favors this idea. The stick itself is spiral in structure, and this characteristic is associated with the idea of strength as exemplified in trees growing in exposed situations, they being of greater spiral construction than those in sheltered localities. If the position of the animal were horizontal no great strength would be necessary in the stick, while the reverse would be true were the position an erect one. This matter can only be settled by means of a submarine diver, as the great depth at which this animal is obtained—fifty fathoms—precludes any chance of the matter being studied from the surface.

The sticks which are the stem or base of the animal, average seven to eight feet in length, and at the thickest part are much the size of an ordinary black lead pencil; they taper at both ends, but much more abruptly at one than the other, and the smaller end is reduced to an extremely fine needle-like point. When stripped of their gelatinous or viscous covering (the living tissues) they present a white pitted surface, except that portion to which the bulb is attached near the large end, which is rough and coarse as contrasted with the other portions. After a short time the sticks split or check longitudinally, in the manner of wood, and they then present an appearance similar to that of a peeled osier or willow wand, hence their local name of "stickfish."

The sticks are elastic to a high degree, so much so that the idea has been suggested of using them as tips for fishing rods, but I do not know if action has been taken in this respect. When bent beyond a certain limit they break short off and do not splinter as does wood.

The sticks are covered with a gelatinous mass from one end to the other, which is the animate portion of the polyp, which, being composite in its character, is made up of an immense number of individuals united in one common whole, and resembles in some respects the coral polyp, which lives within its limy structure. The stickfish lies on the outside. In appearance the whole animal resembles to some degree the arm of the octopus or squid in color and texture, wanting, of course, the sucking discs of the latter animal. The thickest part will probably be about one and a quarter inches in diameter, and the larger end is furnished with a large bulb considerably thicker than any other portion of the polyp, and the appearance of the shape of the entire animal may be said to resemble an onion with a long single stalk. This bulb I take to be imbedded in the ground for the reasons before assigned.

When exposed to the air the gelatinous covering shrinks rapidly and dries hard, and then resembles dried skin or flesh.

These polyps are to be obtained at any season of the year, and procuring them is only a matter of slight expense. The places where they are to be had are comprised within a radius of a few miles. Burrard Inlet, the western terminus of the Canadian Pacific Railway, lies in 49° N., long. 123° W. from Greenwich. The Shetland argus (*Asaphodes setacea*) is sometimes found clinging to this polyp.

The agent of marine and fisheries department of this place has forwarded some of these animals to the international exhibition to be held next summer, where no doubt many of your readers will have an opportunity of seeing them.

NEW WESTMINSTER, B. C.

J. C. HUGHES.

LARGE LEATHER-BACK TURTLE.—We are indebted to Dr. H. C. Yarrow, of the National Museum, for the following: Guaymas, Mexico, April 13, 1883.—S. P. Baird, Esq., Smithsonian Institution: Dear Sir—On the 11th inst. there was caught in this harbor one of the largest leather-back turtles (*Dermochelys coriacea*) I have ever seen. I tried to purchase it, so as to present it to the institution, but the fishermen said they probably would not let it go, and the idea, but nevertheless took its measurements and weight. This species is not known on this part of the Gulf, and, in fact, has never been seen near or within 100 miles of Guaymas by any of the fishermen or captains of the coasting schooners. There has been one or two caught at Altata, a small port down the coast, but they were quite small, not weighing over 150 pounds; but this one is the largest ever seen in the Gulf, and probably only the kind to be obtained ever seen in these waters. As he is still alive, the parties that bought him intend sending him to San Francisco by next steamer, and you may again hear of him from there. I next give you his measurements while alive, so you can better judge of his size: Length, 8 ft. 2 in.; height, 3 ft. 1 1/2 in.; width, 4 ft. 2 in.; circumference, 8 ft. 11 in.; circumference of head, 3 ft. 4 in.; circumference of tail, 2 ft. 1 in.; length of neck, 3 ft. 4 in.; length of tail, 3 ft. 9 in.; length of fore flipper, 3 ft. 10 in.; length of hind flipper, 2 ft. 4 in.; width of fore flipper, 1 ft. 4 in.; width of hind flipper, 1 ft. 2 in. It is a male turtle; weight, 1,102 pounds. I only regret that my means would not allow me to purchase him for the institution, for I am sure it would have been a specimen worth having.—H. F. ENERIC.

## SPRING BIRDS OF NEBRASKA.

BY A. HALL.

THE following is an annotated list of the birds that came under my observation while on a three months' collecting tour in the vicinity of the Platte River, in Southeastern Nebraska, from March 1 to June 1, 1880:

1. Wood Thrush—*Turdus mustelinus* Gm.—Arrives about the middle of May, frequents thick, wooded streams, where it breeds. Nest usually placed in the crotch of a low bush, although I have often seen it saddled upon a limb of a beech tree in the Eastern States. It is composed of grass and mud, lined with fine rootlets. Eggs four or five in number, of a pale green color. This species is apparently not very abundant.

2. Catbird—*Mniotilta carolinensis* Gr.—Arrives first week in May, breeds in low bushes, in which is built a very rough nest, composed of weeds and grass, lined with fine roots and hair. When nesting near a house, bits of cloth and feathers are often used. Eggs dark green. This species is very fond of its home or favorite haunts, never straying more than twenty rods the whole summer. To verify this fact, I saw one with a white feather in its wing that remained within such limits all summer.

3. Brown Thrush—*Harporhynchus rufus* Cab.—Arrives about the last week in April. Nests in low bushes, brush heaps and upon the ground. Eggs, pale green, dotted with reddish-brown spots.

4. Eastern Bluebird—*Sialia sialis* Hald.—A common summer resident. Saw them lighting upon weeds in a thin grove of cottonwoods.

5. Ruby-crowned Kinglet—*Regulus calendula* Licht.—A regular migrant. Breeds in high latitudes, and winters on our southern border. A very fine songster for so small a bird, uttering a very sweet, plaintive warble at short intervals the whole year long.

6. Western House Wren—*Troglodytes domesticus parkmanni* Aud.—This species is a shade lighter than its Eastern representative. Its habits are the same, but it can eclipse it in its song, which lasts from early morn till eve, and is much louder. This bird has a variety of nesting places. I once hung a coat upon a cherry tree, in one of the pockets of which a nest was placed, and the old bird reared her young there, securing well pleased with her novel home.

7. Long-billed Marsh Wren—*Heterothlypis palustris* Cab.—Shot one on the Platte in May, where they probably breed.

8. Horned Lark, Shore Lark—*Eremophila alpestris* Boie.—Resident and abundant in small, scattering flocks. I saw them in company with McCown's and chestnut-collared buntings. I am positive that they breed here, for I shot a female that contained an egg fully developed.

9. Titlark—*Anthus ludovicianus* Licht.—Not uncommon. I saw them near small pools of water and on fresh-plowed land, but never saw more than one at a time.

10. Missouri Skylark—*Scotocoryca squamea*, Sel.—This species arrives from the South early in May and breeds near the Platte River. They had already paired and begun to carry material for a nest by the middle of May. They were very shy and generally flew up out of range, therefore I took but a few specimens. I regretted that I was unable to resort to the usual means to study their breeding habits and hear their beautiful song.

11. Black and White Creeper—*Mniotilta varia* V.—Arrives about middle of May.

12. Orange-crowned Warbler—*Helminthophaga eulata* Bd.—A common migrant. Arrives in the last week in April in company with the Tennessee warbler. The *Helminthophaga* are the most active of the warbler family, and are always busily engaged collecting the insects which form their principal food. This species is easily identified by the concealed orange patch on crown.

13. Tennessee Warbler—*Helminthophaga peregrina* Cab.—Habits same as preceding. I think it is more common than the orange-crowned warbler.

14. Summer Warbler—*Dendroica aestiva* Bd.—Very abundant. Breeds in June. I once found a nest of the species made wholly of cotton batting which it had picked up in the hay-yard.

15. Yellow-rumped Warbler—*Dendroica coronata* Gr.—Very rare in this locality. Only one specimen seen in April, hopping about in low underbrush, and occasionally darting to the ground in pursuit of insects. Its habits here appeared to be strictly terrestrial, but in Ohio, early in April, they will be found in oak timber, darting about, high up in the tops. Late in the fall they are seen feeding upon various kinds of fruit, and occasionally winter in Ohio, where I shot one January 12, 1883, the thermometer standing then at zero. The stomach was filled with berries from the red cedar, and the bird was in a good condition.

16. Maryland Yellowthroat—*Geothlypis trichas* Cab.—Common. Breeds upon the ground. This species is terrestrial in its habits, but it is often seen singing from the tops of trees.

17. Yellow-breasted Chat—*Icteria virens* Bd.—This species is easily recognized by its bright yellow throat and breast and plain olive green back, wings and tail. One unaccounted to its loud, boisterous croakings would not believe that so small a bird was capable of making such a noise.

18. Searlet Tanager—*Pyranga rubra* V.—Rather rare.

19. Bank Swallow—*Cotile riparia* Boie.—Saw this species breeding in colonies in the sand hills on Loup River.

20. Bohemian Waxwing—*Amphisp. geryon* Sw.—A common winter resident, arriving in large flocks from the north. It is easily identified by the chestnut-colored patch on under-tail coverts. Breeds in the far north.

21. Townsend's Fly-catching Thrush—*Mniotilta townsendi* Cab.—A fine specimen of this species was sent me in the flesh, Feb. 9, 1880, by my friend, Frank W. Powell. It was taken on Wood River. I think its occurrence purely accidental and know of no other record of its occurrence in Nebraska. This bird is said to be one of the most beautiful in the sweetness of its notes. It is found throughout the Rocky Mountain range in the vicinity of juniper and cedar trees, as they feed largely upon the berries. They are also expert fly-catchers. But little is known of its breeding habits.

22. Bell's Vireo—*Vireo belli* Aud.—This is the commonest species of the family in this locality, and in fact it was the only one I observed. But there are several others found here which I did not notice.

23. Great Northern Shrike—*Lanius borealis*, V.—Not uncommon in winter. I saw them perched upon weeds watching for mice, which they pounce upon like a hawk and carry off in the bill. They often impale them upon thorn trees whence the name butcher bird.

vary from the slightest amount of poisoning to one fatal. This depends altogether upon the amount of venom absorbed in the system and the rapidity of its diffusion through the circulation—matters which turn upon the amount of venom in store at the moment of striking, the vigor of the animal body struck, and finally the state of health of the person attacked. No positive specific antidote is known. Surgical means of preventing dispersion of the poison through the system, and alcoholic stimulation to the highest pitch, are the usual resorts.

"While the venomous properties of these reptiles, not easily overated, should suffice to insure due caution in capturing or killing them, it is as well to remember that the utmost range of a rattlesnake's blow is less than its own length. They may readily be captured alive by pinning down the neck with a forked stick, and the animal is usually, when not too large and powerful, if seized immediately behind the head. In case of a strong snake, however, the power of constriction is sufficient to paralyze the muscles of both arms, as in the case of a person who had seized two of these reptiles at the back of the neck. He had to be relieved by a bystander. A method employed in the South to capture the diamond rattlesnake is, perhaps, worthy of mention. A silk handkerchief is fastened to the end of a pole, which is held toward the reptile, which strikes fiercely at it. The fangs and teeth become engaged in the flure of the silk, and a dexterous movement of the stick readily pulls out the fangs, and the reptile can be approached with safety.

"There seems to be a special and peculiar animosity existing between the rattlesnake and copperhead and the blacksnake and kingsnake, these two latter species waging a constant warfare against the former, and invariably conquering. After the conflict the vanquished is eaten by the victors. In one case a large blacksnake had seized a diamond rattlesnake, and entwined two or more folds behind his head, and several six or eight inches further back, then by muscular effort had torn the body. It is a well-known fact that both rattlesnakes and copperheads will endeavor to get away from the kingsnake, and in the South this beautiful and harmless species is protected in view of this fact.

"The peculiar life relations of the prairie dog, burrowing owl and the rattlesnake, are well known. When competent observers, familiar with the animals, disagree, as they have, respecting the kind and degree of relation between them, we need not be surprised at conflict of opinion in the books of naturalists who never saw either of them alive. No little bosh is in type respecting the harmonious and confidential relations imagined to subsist between the trio, which, like the Happy Family of Barnum, lead Utopian existences. According to nursery tales, in this underground elysium the snakes strike the rattles to the puppies to play with, the old dogs cuddle the owlets, and farm out their own litters to the grave and careful birds. When an owl and a dog come home, paw-in-wing, they are often mistaken by their respective progeny; the little dogs nosing the owls in search of the maternal font, and the old dogs led to wonder why the baby owls will not nurse. It is a pity to spoil a good story for the sake of a few facts, but as the case stands it would be well for the Society for the Prevention of Cruelty to Animals to take it up. First, as to the reptiles, it may be observed that they are, like other rattlesnakes, dangerous, venomous creatures. They enter by business in the burrows, and are after no good when they do enter. They wriggle into the holes, partly because there is no other place for them to crawl into on the bare, flat plain, and partly in search of owl eggs, owlets and puppies to eat. Next, the owls themselves are simply attracted to the villages of prairie dogs as the most convenient places for shelter and nidification, where they find eligible, ready-made burrows, and are spared the trouble of digging for themselves. Community of interest makes them gregarious to an extent unknown among rapacious birds, while the exigencies of life drive the plains cast their lot with the rodents. That the owls live at ease in the settlements and on familiar terms with their four-footed friends is an undoubted fact; but that they inhabit the same burrows or have any intimate domestic relations is quite another thing. It is no proof that the quadruped and the birds live together that they are often seen to scuffle at each other's heels into the same hole when alarmed; for in such a case the two simply seek the nearest shelter, independently of each other. The probability is that young dogs often furnish a meal to the owls, and that in return both the owl and the dog are benefited by the arrangement.

After the reading of the paper, Dr. Christopher Johnston showed by blackboard diagrams the peculiar formation, etc., of the fang of the rattlesnake.

## AMERICAN TAXIDERMISTS' EXHIBITION

THE annual exhibition of this society, now being held at 419 E. 11th St., Sixth Avenue, between Forty-first and Forty-second streets, is well worth a visit. There is much to be seen there that is interesting and beautiful, and yet it must be confessed that as an exhibition of the taxidermist art it is something of a disappointment. The visitor enters the hall expecting to find all the work of a high order of merit, and instead of this he sees much that is good, a great deal that is commonplace, and more or less that is positively bad, and unworthy of a boy who has not yet mounted a hundred specimens. On the other hand there are a great number of pieces, which, while they are like nothing in nature, are still extremely beautiful, and which show how the skins or horns or heads or hoofs of birds and beasts may be turned into most attractive ornaments for the parlor, the dining-room, or the boudoir. It is in this respect that the present exhibition deserves high praise, and is most successful.

The society this year exhibits with many excellent productions, much that is really very wretched. It could scarcely be otherwise, as it is a society of amateurs, and must be accepted, or else jealousies and heartburnings would arise, and the exhibitors whose pieces were rejected would feel that they had been badly treated by the society. We may first refer to the heads of the ruminants, which are hung high up on the walls of the hall. No. 705 is an excellently mounted head of a Virginia deer, not looking forward after the ordinary method, but somewhat turned to the right. The pose is a graceful one, and the work very creditable. Passing by the door of the side room, a beautiful caribou head looks out from the wall, and above it to the left is a moose head, which is a fine specimen. On the other side of the caribou, and above it, is an elk head, with the horns in the velvet, which looks like nothing in the earth beneath, or the waters under the earth. The same is

true of the elk head and the mule deer head on the other side of the stage. They are hopelessly bad, and the men who put them up had never seen the animals in life. If they had they could never have distributed their stumpe about the skins as has been done, making the head so wide across the eyes and bringing them down to a gimlet point on the nose. Only two or three antelope heads are seen on the walls, and they are neither very good nor very bad. There is a capital mountain sheep's head and a good Virginia deer's head to the right of the stage.

On the stage at the rear of the hall, stand male, female and young moose, and a bighorn. The latter is excellent, and so is the young moose, but the same cannot be said of the adults. They are stiff, and their necks are not thick enough, and are too long. In the center of the room is a young elephant, a most excellent piece of work. A piece called Tartar hunter attacked by tigers, is very striking, and the horse extremely lifelike. The hunter has captured the tiger's cubs, and as he is riding away, the old ones have sprung upon his horse. One of them he has shot, and at the other he is striking with a dagger. The conception, though not a new one, is well executed, the only weak point being the man. In the front of the hall is a spirited group; two lions fighting over an antelope which one of them has killed.

There are three groups on exhibition representing dogs pointing birds, and we wish that we could say that any one of these is thoroughly good. A white with a little red setter, standing a very quail, is on the right of the door as we enter. The background and all the accessories are excellent, but the dog looks like no setter that we have ever seen. He is long and thin, and has a very small head, a minute head in fact. Evidently the skin has been very much stretched. The head is very fair, but the rest of the body is all out of proportion to it. Not far from this, but across the aisle, is another dog, this one a brown and white pointer, standing a pair of ruffed grouse. The case, the ground and the birds are even better than with the setter. The dog's head, neck, legs, and tail are extremely lifelike, but the body is not good. It is round and without shape; the body of a dog, in fact, which is so fat that not a bone is visible. The flanks are not drawn in, not a rib nor a vertebral spine can be seen. A dog shaped like this could not and would not hunt an hour. Just in front of a window is a black and white pointer on quail. There is no background, and owing to its being directly against the light it cannot be well seen, but it is the best stuffed dog on exhibition. The attitude is not nearly so well chosen as that of the other pointer, but it is all over a dog, and were it as well shown as the other two it would far surpass them. The group of smaller animals and birds are of all grades of excellence, from perfect to absurd. Two of the most strikingly beautiful are a group of duck bills (*Orythorhynchus*), and one of terrapins. In these the water is represented by glass, and the whole work is done so perfectly that nothing is left to the imagination.

Among the bad groups, had in taste and execution, are a group of blue-winged teal, and one of herring gulls and terns. Near the windows, Wallace has a remarkably fine series of owls, a handsome pair of black-backed gulls, and a good group of English pheasants. Some beautifully stuffed herons (Nos. 141-2) are deserving of close examination. Near the brown pointer and partridges, is a pretty group of game birds, ruffed and pinnaed grouse, and woodcock and snipe, very nicely done, though the association is, of course, utterly unnatural. There is also near here a beautiful group of woodcock and young. A number of dining-room pieces—ducks hanging on shields or panels—are to be seen, some of them very good, others only passable. A canvas-back and an old quail on the south wall are by no means satisfactory, while some of the stuffed harlequins on the north wall are very good. There are a great many stuffed single birds and animals. Most of the latter are very good, and so are some of the birds, but judging from the character of the work, we should imagine that most of the taxidermists had never seen a grouse or a quail alive. These stuffed grouse are pretty and graceful, and their feathers are beautifully smooth, only—none of them are shaped like grouse.

It is impossible to speak of all the pretty things that are here in the way of decorative taxidermy. On the north wall near the windows, and opposite it on the south, are a vast number of beautiful and tasteful objects. There are some beautiful peacock and owl screens, and some charming effects are arrived at by putting half a bird against an appropriate background in a frame. Thus a little white heron stands against a dark blue plush or a black velvet, a woodcock against a light background, a green trogon against white, and a northern hare in winter dress against black, a shoveler and a cock of the rock against blue and white respectively. Then there are all sorts of queer and fanciful devices, in which owls are brought into play, many of them ingenious and some very pretty. One of the most grotesque and things on exhibition is a dying little white heron, pierced by a golden arrow.

A noticeable feature of this exhibition is the plaster casts of fishes and reptiles, of which there are quite a number, all very fine. The society has also secured the loan of the working models of a number of Mr. Kemp's groups of animals, and these make a fine show.

Enough has been said to show that there is a great deal to be seen at the present exhibition, which we presume will be a financial success.

"NEVER TOO OLD TO LEARN."—I have seen snow buntings since boyhood (and that is not a few years), but never until the 23d ult. saw them alight on a tree, and now "Pick City" and "Avalanche" say that "it is not uncommon for them to do so." I have also been informed by Mr. J. H. Langille that he has often seen them alight on trees, but I think he still has doubts of the horned lark doing so. I said in my last that I did not doubt that "Taxidermist" saw them in a tree, but when I see them do it I shall probably be just as much surprised as I was when the snow bunting did it. In the article "Some Southern California Birds," in your last issue, the last sentence in regard to horned larks reads: "Have seen them in a tree or bush." I presume it should have read, "Have never seen them in a tree or bush."

—J. L. D. (Lockport, N. Y., April 29).

"SHAMING SICK" AND "WHO SAID RATS?" the well-known pictures published some years ago by the *Illustrated Sporting and Dramatic News*, of London, are issued as a colored supplement to that journal of April 14. The *News* is one of the handsomest papers published, is of a healthy tone, and reflects great credit upon its editors and publishers. The American agents are the International News Co., Beekman street, New York.

## Game Bag and Gun.

GAME RESORTS.—We are always glad to receive, for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

### LOST ON THE SNIPE MEADOWS.

THE old adage, "two's company, three none," for once at least was not true. Although it may have been applied to other parties, it certainly did not to ours.

On the 11th of September I left my house in Portland on a trip to the town of Raymond, for the purpose of spending a few days among the game birds of this State. Upon arriving on the grounds I found the birds quite thick and a prospect of good shooting. The next day I mailed a letter to a couple of friends in the city, inviting them to come up and spend a few days with me. By 9 P. M. we were making ourselves at home.

The next morning at 3 o'clock we were on our way to the Moose Meadow. It was quite dark when we arrived on the grounds and not a duck in sight. Five, ten and fifteen minutes pass. Whir, whir! splash, splash! and four birds alight on the water not thirty yards from us. Jordan gives it to them sitting and I take them on the wing. Result two birds. Another fifteen minutes pass. Two teal silently wing by White, who is on the other side, and drop into the water several hundred yards away. I cautiously creep that way and—whir! away they go; bang—a clean miss; bang—miss for Jordan. An hour silently passes away.

The place in which we were gunning is situated thirty miles from Portland, and within a circuit of several miles there are not more than fifty houses. It is one of the best places for ducks in this State. There are three large meadows, connected by means of a brook, and the outlet of all is into Sebago Lake. The upper, or Moose Meadow, is the smaller and the best and principal feeding ground, and here the birds congregate mornings and evenings. The center and largest is the Great Meadow, and the lower the Little Meadow.

Having watched the ducks for several mornings, I found that their plan was to come to the Moose Meadow mornings and nights to feed, and, if disturbed, to start the ducks during the day, and when started to proceed to the lower meadows. We formed our plans accordingly. Surrounding these meadows is a heavy growth of pine and oak, in which, if unacquainted, one is liable to get considerably "mixed up in his reckoning." Gray squirrels and partridges are plenty, and a few woodcock. There is one drawback to the duck shooting, and that is that the meadows are becoming rotten, and one cannot walk everywhere without some caution; but with a boat this is offset, and, if so provided, one could enjoy sport "fit for a king." There are several semi-put-hunters there, but, with three exceptions, they do not little harm beyond giving the birds a scare, and making them will enough to make a good score something to brag about.

The morning of the 15th was foggy and rainy; nevertheless we started for the Great Meadow, walking along the shore and starting a few birds, which went to the Moose Meadow. We soon reached the head of the pond, and, turning guide, inside of fifteen minutes we were standing on the dam at the foot of the upper meadow. We took our positions and awaited developments. A half hour slipped by with no birds. Leaving my blind, I cautiously worked my way along the side of the meadow, and proceeded to the head of the pond, starting a bird. Owing to the extreme drought of this year, the greater part of the meadows, which generally is under water, is high and, for the most part, dry. Still, one must proceed with some caution. From here I commenced to work down toward my companions, and had covered about half the distance when four ducks ro-ro from the middle of the pond, and proceeded straight away from me, too far for a shot, but going toward Jordan. A puff of smoke, and three swing to the right; another puff of smoke, and only two proceed onward, with increased speed.

Continuing on my way I start a bird from under a log, on which I had a very peculiar footing, and without thinking of the results (only on the duck), fired. Upon recovering so to speak, I found myself well deep in the soft mud under the log, and the duck proceeding on his way. I managed to get out, and vowing vengeance on all the ducks in creation, I walked on and managed to flush a woodcock and snap that empty shell on him, but marked him down, and upon again starting him he came to bag. Rejoicing my companions we wended our way homeward. That evening we watched and waited, but being without a boat it was too dark to find our birds if we shot any.

The following day we visited one of the adjacent towns. At daylight the next morning we were on the meadows, but at six o'clock left for a favorite partridge ground. Dinner time found us with two ducks, no partridges and four gray squirrels. As the morning was to be our last we decided to be absent all day. Leaving the house at 4 A. M., we scoured the woods and upper meadow, and were quite lucky. About noon we sat down on an old tree at the head of the Great Meadow, and while conversing on various topics I saw a bird drop into the brook not one hundred yards away, and noticing the others I started for him and Jordan followed. The duck rose some fifty yards, circled around to the right and passed directly over White, who coolly brought him down, and he is now mounted in the latter's room.

About three I started for the house, but the others remained, and on the way shot a hawk measuring forty-two inches.

After supper went to the post-office, and on returning home was astounded to hear that my friends had not yet arrived and that probably they were lost. After carefully considering we came to the conclusion that if they were anywhere in the upper meadows, or in fact this side of Glover's Ridge, they could hear a gun; therefore I heavily loaded six shells, and going to the top of a small hill fired two charges in quick succession and eagerly awaited a response. A minute passes; again I fired. Hullo-o-o-h!—no, that was a loon; again I fire. The echo runs through the woods seemingly with noise enough to be heard miles away. But no answer came to our waiting ears. Solemnly we wend our way toward the house.

For an hour we sit around the stove, and then the host and his wife retire, but for some time I sit with my head in my hands, and my elbows on my knees. About 10:30 I am about to retire, when I hear a whirr, and imagine I hear Jordan's voice. "Nearer they come, and I am not mistaken, for it is them, and a more dilapidated and thoroughly tired out

couple was never seen, but they were happy, for five ducks told the story of their skill. After they had stowed away their supper, we draw our chairs around the stove, and White told their adventure as follows: "After you left Sam he hunted me up and together we started to wade to a small island, and easily reached it, not going over our knees. A natural blind stood on one side, and of this we at once took possession about 3 o'clock. A green-winged teal started out of the lily pads (which are two feet high) and swam out into open water. I take a careful aim and fire, but he never kicks, and lies motionless on the water. As soon as retrieved we settle down again, but before sundown manage to get a diver. As soon as it grows dark the fun begins. The birds fly in all directions. Whirl on the right, whirl on the left. A long black streak can be seen in the northern sky, which soon develops into a flock of twenty-seven ducks, which I took to be black ones.

"Yes," said I, interrupting him, "they are black ones, and come from a small pond away over in the woods, where they stay during the day, and come to the meadows to feed at night and depart before daylight."

"We waited for them to pass by near enough for a shot, but they gave us a wide berth. We gathered up our birds and started to return to the shore, but to our surprise we could not see it. We had been looking at the bright sky so as to get the outline of the birds against it, and on looking into the dark were blinded for a few moments. Taking a long stick in one hand we felt our way toward the shore, which we succeeded in reaching in about a half hour. Once on shore another difficulty presented itself, *i. e.*, which way was home? Luckily we had set our compass before leaving, and holding a match, we soon found the requisite direction. We struck into the woods and traveled for some time, then we stopped and lit a match to make sure.

We were traveling very nearly in the right direction when we struck the old logging road which leads from the main road to the meadow. This we followed till we reached the tall pines where they logged last winter, and here we lost the path while in this growth, for it was as dark as night, and we could not see our way. We made a first match in order to make sure of our course, which, luckily for us, had been nearly correct. Stumbling on, over stumps and fallen trees, first one and then the other was ahead, and the blind one had to take the bushes as they switched back, which was very pleasant; speaking now and then to make sure we were together, at last we came out on the shore of the meadow."

"Yes," said Jordan, "and I swore that it was some one we had not yet visited, but White said it was the Great Meadow."

"We walked up the shore of the meadow until I found the rocks where the road comes in. Turning in here we followed it as long as we could, and several times we found ourselves in the brush, but managed to strike the road again, and after about a half-hour's work we came out in the main road. Our trials were now over, for in fifteen minutes we were here. Now, I move we go to bed, for it's most eleven."

The next morning was spent in packing, and our host, who owned a good horse and double-breasted wagon, offered to deliver us at our respective houses in the city for one dollar each, and we gladly accepted his offer. SMALL.

## OUR WOODCOCK SHOOT OF 1882.

LAST year Charlie and I invited Will, a gentleman (well known to many of the readers of *FOREST AND STREAM*) as crack shot, good talker and lover of the Irish red, to come and have a hunt with us for woodcock, which invitation he accepted, and we had a right jolly good time. On his return he had published in *FOREST AND STREAM* an account of the trip. That was the time when we got 'em.

"This year he came again and we didn't 'get 'em,' so I will undertake to tell it this time, and although he dubbed me 'little one' last year, I shall not make any allusion to his big 'giant,' if he is over six feet tall and weighs No. 12 boots.

From September 1 to November 11 Charlie and I had watched our favorite grounds for woodcock, visiting them as often as twice a week, and some days we did not see a single bird. The most we saw in any one day were four, and we had about made up our minds that there were no birds this year, and that we would not make any more runs, when this as an old villager for rail, woodcock and English snipe, as they did not appear to be any. On Monday, November 13, we heard that so many woodcock had been flushed by persons out walking the day before that we said, "It is all right; they have come at last and we must be off." We telegraphed Will, "If you have faith enough, come and we will go to the hill to-morrow." It was quite evident to us that he had the necessary faith, as he arrived early in the P. M. to find us with our dogs and traps ready, and very soon after we took another train. I have remarked before that he was a good talker. After the usual hand-shaking and looking at the dogs, he cocked his bat on the back of his head and opened up: "Say, we'll get 'em to-morrow; they are here. I saw them shooting rail on the river; say then from the car window, and just as I left home a farmer's boy brought in several woodcock and the woods is full of 'em. Oh, if it is pleasant to-morrow we will get them. He then they will lay out that warm side hill in the young alders. 'Til bet this minute there are fifty birds in the piece in front of the old school house." And so he talked on until the brakeman shouted "Jordan." We picked up our guns cases, and taking the dogs by their chains, alighted.

The first man we saw was our genial friend, the Doctor. The Doctor's house is a two-story frame building on Jones street. As to the size of it, in fact I haven't the remotest idea, but its stinging quality is something wonderful, and it is the general opinion of all of the Doctor's friends that he is doing himself a great injustice in not securing a patent on it. I have known every room in this house to be full, yet when some of the Doctor's friends would drive up, he would say, "Drive around to the barn; then come in and stay all night." I wondered where they would sleep, but the Doctor would go into the dining-room and talk with his wife, and presto! another room was added to the house and prepared for guests. This building has store-room, Doctor's office, sitting-room, dining-room, library, and sleeping rooms *ad infinitum*. The Doctor's wife is one of those large-hearted women who occasionally meet with just as ready and willing to entertain the Doctor's friends as he is to have them entertained. The Doctor—why every one knows him; his name is a household word for miles around him, and his Lake Hamilton country, with its fine camp and spends a portion of his summer vacation, he has hosts of friends, and many of the guides will testify to kindnesses shown them in visiting the sick, extracting teeth, and relieving their suffering.

On one occasion while at his house, having returned at about seven in the evening from an all day's hunt, he found that there was a call for him to go and see Mr. W., living about five miles from the village. The Doctor says, "Well, I am glad of it, as Mr. W. was here yesterday and wished me to come and see his house. And he did go; made both calls, and it appeared to me that he was more particular in his treatment of the house than he was of Mr. W."

The Doctor marched us to the dining-room, and after a good hearty supper we returned to the office, where we enjoyed our pipes and the evening passed pleasantly talking over the past, and receiving calls from our old friends Messrs. White, Allen, Jay and others, and our good Methodist brother that always says, "Well, look at all the dogs." And, by the way, there was quite a show. First, there was Charlie's Don, a first-class dog on all game. Will had Snap, a red Irish, winner of first prize in New York in puppy class in 1882, and first in open class in Washington in 1883. The Doctor's Fred (Laverack) and my red Irish bitch Daisy (litter sister to Snap) and Jay's water spaniel. At 10 o'clock we took a short walk to give the dogs a little exercise and see what the weather prospects were for the morrow, and then retired.

We were up bright and early, and found that the Doctor's wife had been making hot breakfast ready for us, and as usual (never forgetting the dogs, she had the pudding ready for them) the lunch basket and jug of coffee for us. Now, the Doctor's wife is such a firm believer in the coffee sign as to the success of a day's hunt that she never allows a sportsman to leave the house without it. The morning was clear and cold that we had known woodcock to be here later than this, and the black ponies took us along at a rattling pace, until we reached the old place, where Charlie and Will left us to hunt up on the south side. Doctor and I were to ride on a quarter of a mile further and then hunt the north side, and we were to meet at the old pond. John was to wait for us with the team at the old school house.

We climbed over the fence; Fred and Daisy went to work, quartered the ground high and low, and at last there was a faint showing of game. Daisy stopped, half pointed, but it was a false alarm, and we were obliged to get the way up and did not find either woodcock or grouse. This was not at all encouraging, as this piece afforded us some very fine sport last season. We separated again, Will and Charlie hunting on the north side of the pond, the Doctor and I on the south side, until we again met at the school house, and after comparing notes found that we had drawn another blank. We all climbed into the wagon and started for the piece at the head of Green Brook. "This was our last place for woodcock, and the Doctor remarked, 'Look here, boys, I told you there was no use of hunting for woodcock; they have not been here, and this is an off year.' We were soon satisfied of the truth of this, for we hunted this cover thoroughly, and not a bird did we find. In this place last year in about one hour we bagged twenty-five woodcock."

We returned to the wagon, and after spreading down robes and blankets sat down to lunch, such as we could only be prepared by a woman that knows the wants of hungry sportsmen. In Will's report of our hunt in 1881, he failed to mention the fact that his red Irish Larry ate up all the lunch, and when he jumped out of the wagon to hunt the first piece, he had the empty basket hanging on his neck, and if the present owner of Larry should happen to read this, I wish he would call to mind if at the time the dog was purchased he was warranted "Nary a West of his lunch." After lunch Charlie said, "If you boys are entirely satisfied that there are no woodcock, we will start and try the grouse in a small piece on our way home." We did stop and try them. They were up in trees, would not lay for the dogs at all, and we killed just one, although Will declares that he knocked off both wings and legs of another with his "far-killin' Greeney, and from the appearance of a pine tree (and since recovered) 'Nary a West of his lunch." After lunch Charlie said, "If you boys are entirely satisfied that there are no woodcock, we will start and try the grouse in a small piece on our way home." We did stop and try them. MISSOURI.—Norborne, Carroll County, April 23.—This is one of the best, if not the best, resorts for snipe and general wildfowl shooting in Northwestern Missouri. Game has not been plentiful this spring, but some of the local hunters have been averaging their five dozen snipe a day for the past three weeks. The biggest bag I have heard of was eleven dozen killed in one day by two guns. I have been trying some Kynoch perfect brass shells, and find them anything but perfect. They persistently miss fire, expand after a few shots, and when crimped are an unmitigated nuisance, as it takes five minutes to get them into the gun. I tried a hundred. An off to California in a few days, where I hope to tackle some grizzlies, etc., next winter.—F. W. B.

BALTIMORE DUCKERS.—The Harewood Ducking Club, of Baltimore, Md., whose club grounds are at Harewood on the Gunpowder River, below the railroad bridge, numbers twelve members. The club score for the season from Oct. 16, 1882, to April 10, 1883, shows a total of 1,968 birds, divided as follows: 37 canvasbacks, 1,292 redheads, 134 blackheads, 98 wildgeese and baldpates, 329 coots, and 129 miscellaneous, including mallards, teal, crows, etc. One swan killed weighed eighteen pounds.

THE GRADY BILL was defeated.

## Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

—ANGLING RESORTS.—We shall be glad to have for publication notices of good fishing localities. If not otherwise spontaneous favor us with notes of desirable points for angling excursions?

"Like Brad—for whom the Fowler spreads his net,  
And trawls them in with whistler and a steel;  
Or fish when bayted lookers old Anglers set,  
Which baiten, brings them some into their hole,  
So that old Angler-for-menus-comes, some wymes  
With sweetened bytes, and some with subtle gynes."

—Sir John Steadling, "Divine Poems." (1625.)

### PIKE FISHING IN FOX RIVER.

IN a river of some breadth and unequal depth, even "fishers behind the net" secure good luck sometimes. Though I am late with this sketch, several others having preceded me on the subject of wall-eyed pike in response to your invitation for contributions, yet I may have the good fortune to be admitted to your royally generous columns.

Fishermen are usually practical men, and I have noticed that the articles on this subject have not been of a theoretical or scientific character, but have had their birth in actual experience. The fish under discussion I have had the sport of catching and the pleasure of eating. The Fox River (Ill.) wall-eyed pike are as plentiful as black bass, and though not quite so gummy on the hook, they are, to my taste, more sweet and luscious on the plate. I recall one morning in the summer of 1880 when three friends drove up to my house in Batavia, with the shout, "All aboard for South Elgin fishing grounds!" Being too fond of the sport to allow such an opportunity to pass by unimproved, I abandoned my projects for the day, jumped into my fishing regiments, seized my fly-hook and rod, and joined the merry company, who had so kindly reserved a seat for me in the carriage. The morning was beautiful and the drive of eleven miles up the river delightful. We stabled the horses at South Elgin about ten o'clock, and then tried for bass, first with the fly and then with the spoon, until noon, with poor success. Neither would lure them. After lunch we took out our net and some minnows. With these for bait the fun commenced. One after another we landed them. This moment it was a bass and the next a pike—a genuine wall-eyed. Sometimes three or four would be taken in one spot in quick succession, several of the heaviest weighing four pounds each. It was easy to distinguish between the bite of a bass and that of a pike; the bass would take the bait quickly and move off rapidly, while the pike was more deliberate, when once "struck" and the fish felt the hook, he would at first resist and struggle with a violence equal to the bass, but tire out and yield sooner, seeming to lack the power of endurance that the bass possesses.

We enjoyed three hours of exquisite sport, and at four o'clock reeled up our lines and unfurled our rods with a feeling of reluctance, for the fish were still biting nicely. However, each of us had about as many as we could conveniently carry back to the village where the carriage was (we had fished a mile down stream), and we had a drive of eleven miles before us. It is hard, though, for a real lover of the sport to stop fishing while the fish seem unwilling that you should. But then my humane man, out of charity for the fish, and consideration for his fellow men who may fish after him, will stop when he has enough, and not stay to kill just for his own self-gratification.

—Apropos—"Does the muskellunge leap?" Yes, I've seen 'em, no mistake.

H. H.

FATHERSON, N. J., April 21, 1883.

### WHAT A DAY BROUGHT FORTH.

IT did seem to my impatient spirit that spring would never come. I had looked over my tackle carefully, found my faithful rod all right, packed my fly-hook, reel and bait-box carefully in my creel, had my old cod looked over, and was in every sense ready for the first of April and its attendant trout-frying. But imagine my disappointment when that day opened a veritable "All Fools' Day"—sour and wet, with patches of snow visible on the neighboring hills, telling of snow water in the streams and general bleakness. So what could I do but nurse my impatience and wait for better weather. In a few days it came, and two or three pleasant days made me resolve that "Providence and the weather permitting," the morning of April 10 would find me working off the accumulated biliousness of the winter, and trying, at least, to initiate that happiest time of all the year to me—the trout season.

Thanks to our new baby, who, like others of his kind, is an early riser, I was up betimes on the morning in question,

and could have shouted like a boy when I looked out upon the breaking of so fair a day as one could wish to see. The rosy fingers of the dawn were mellowing the east, and the birds were singing in that joyful strain that ought to soften the heart of the most confirmed misanthrope. Everything pointed to an auspicious time, and, swallowing a hearty breakfast, I was soon climbing the mountains to the east of the town.

When the six o'clock whistle sounded, I was (light hundred feet above the plain, and, pausing for breath, took in the beautiful scene below me, than which no lovelier was ever vouchsafed to mortal eyes. I will not attempt to describe it, that valley stretching away toward the Genesee, dotted with villages, hamlets and sinuous water courses. But as I stood on that lofty summit all aglow with my unwelcome exercise, the soft south wind fanning my face, I was happy and thankful to a kind Providence for the privilege accorded me of living in so beautiful a world, and having health and inclination to enjoy its beauties.

While resting, I was attracted by a rustling in the leaves over the fence in an adjoining wood lot. Peering through the fells I saw two large raccoons on the ground rooting like hogs for last year's acorns. So I held them there upon their foraging, that I at once made up my mind they were just out from my bygone dream, and although a trusty Deerling lay in my hip pocket, I was content to walk toward them in peace and watch their motions. Getting within about twenty-five feet, I heaved a small rock in their midst, and watched them scuttle away on their plantigrades, only to stop within easy gunshot and gaze at me wonderingly.

Leaving the "coons" to themselves, I took a brisk gallop, and in half an hour was beside a stream that for many years has yielded speckled trout. It was only a half a mile from the purring brook, beset by many a fisherman, struggling through the alder and sumach to hold its own, and keeping up nobly, despite its manifold harassments.

With trembling fingers I adjusted my tackle and, with a good fat worm for bait (don't talk to me of flies in April), made my first cast and drew a blank. Moving down the stream I found more or less ice overhanging the water, and after repeated casts with no results I came to the conclusion that I was too early. Still I was happy, and resting no time in regrets, started for the main stream. Stopping at the house of a farmer friend, through whose lands the stream ran, and who kindly allows me the privilege of fishing, I received the cheering (I) intelligence that the water was very high, and to fish would be folly. Nevertheless, I started for the bank-fall creek, and was soon busy casting here and there, but nothing rewarded my efforts. All the old holes I knew so well were totally obscured by the rushing torrent.

Arriving at an abrupt turn in the stream, where ordinarily the best pool for trout was located, I mechanically made my cast, thinking meanwhile of the sport I had enjoyed at the same place in times past, when suddenly came that delightful shock that no fish but the speckled trout can send tingling through one's nerves. Down bowed the supple lancewood, and in another moment an eight-inch lay on the bank, with a merry "whoop" an audible "the first trout of the season." I admired the beauties of my prize a moment, then consigned him to my basket.

Encouraged by my success, I went to work with renewed vigor, and by dint of careful angling had by noon ten beauties, the largest fully nine inches in length. Thinking this would do for the first time, I reeled up and started on my four-mile walk as happy as though my success had been phenomenal. And of course, as I walked, I indulged in the thought, "Wasn't I strengthened in body and mind by this communion with nature? Didn't I have trout enough for a nice breakfast for the little family? And, best of all, hadn't I got rid of that consuming trout fever that had been so persistently chasing me for a month, and all in a legitimate way, too? Yes, indeed. Now I could go about my daily duties, for a time at least, without being harassed by visions of angling that never faded."

The time is coming when trout fishermen must learn to be content with small baskets and large enjoyments. The success with rod and reel must be made secondary to the delights growing out of the outing. The guild must let "books in the running brooks" supply the place of trout. Then, and not till then, will the full delights of angling be ours to enjoy; and I have written the above little sketch of a day beside some troutless water, to tell what our "non-anglers" with nature can find to enjoy when schooled in the art of trout fishing where trout are scarce.

### SHAD.

WE have several times expressed a personal preference for the shad as a table fish above any fish that we know. This, of course, is to be modified by certain conditions, as: the fish must be a large one of six pounds or over, fresh run, and properly cooked. A small shad is always dry and flavorless. The following poem by George Alfred Townsend (Gath), written from New York to the Cincinnati *Enquirer*, we think worth repeating:

"Shad are now caught here. In an old country shad would come in with a fete day. The world has not their equal for fineness, indescribable fineness like a watercress, and delicacy, yet with satisfying potency. One shad is the measure of the representative family. The father's partiality is shared by the mother in the line of Herod. From birth to bones the shad's epic is like a silver spirit—less, translucent, unresisting, like the passage of the moon through the rivers and the sea. Migratory, but with childhood memories of locality; fruitful religiously, and even in the dream of young children and large gentle families, they seem like the spring laubs of the water, grazing the infinite fields of sheer. What dangers they pass through, going and returning, the legends in the line of Herod never had. Provided with nothing to make battle, with tiny teeth and miniature fins, they course the ocean like the silver galleons of old days, beset by pirates but protected by the saints. Although the royal guest at feasts and poor men's tables, they are, like all enduring nobility, peasant-born. The martyred menhaden is their cousin; the herring is their step-brother. To see them caught is like seeing angels fall—so peacefully, so fashionably, and in the butcher's shambles they can feel their delicate armor turn the light of skies. This is my only poem on spring this year."

With four feet of snow at Connecticut Lake, and the Connecticut River being fed by this lake, the water is so low that shad are slow in coming. In conversation with a prominent dealer, who handles about 50,000 each year, he says the shad increase in size every year. In 1852 they were very small, and decreased in size for a few years, and for a

time the dealers began to think that they were going out the little end of the horn. They catch many which weigh seven pounds, an occasional "barren" one weighing ten to twelve pounds. When the shad get up to Holyoke, Mass., considerable fun for the fly-angler is expected. They take the fly, a special one, quite readily. With 200 feet of line out, and a six pound shad, and to one end, it is no "boy's play" to land your fish; the water being very fast and many boulders in it, the chances rather favor the fish. "Whoops," or alive, are cheap, selling for about ten cents per dozen; they are used for dressing for land when they are much cheaper. FURCH PRICK.

HARTFORD, Conn., April 28.

### THE SUNDAY FISHING LAW.

*Editor Forest and Stream.*

I desire, as one of the minority, to enter my most earnest protest against the recent act of the Legislature, which emphasizes and attempts to galvanize into life the long-since dead letter-law making it a crime to go fishing on Sunday. I consider such act to be pernicious in its effects and reprehensible in its character, and I very much question whether any action of the Legislature for many years could be more so.

While it must always be conceded that religion and the keeping of the Sabbath (a part of religion) is entitled to the utmost love and veneration, it should be likewise observed that nothing can be more hurtful to both than even the appearance of hypocrisy in such matters. It would be difficult to find any amusement, pleasure, or recreation more innocent and harmless in its effects than fishing. Thousands are infatuated with the rest, absence of care, solitude, peace, and contentment of hope and fear that accompany it. They leave it with regret in the fall, and look forward to its coming in the spring. Many of our ablest, most prominent and best of men, including many of the clergy, whose names might be mentioned, have become stern votaries of its pleasures and influences, and have spoken in the highest and most eloquent terms of its healthful and beneficial tendencies upon body and mind, as the result of the open air exercise, and the sweet and pure air, and the rest and thought and reflection. It would be pedantic to cite them.

If any pleasure or pastime is permissible on Sunday, it seems to me this should be. It has nothing akin to "work" or "labor." It is "rest" in its clearest sense, carrying with it full opportunity for the admiration of nature and deep reflection upon the goodness of the Author. It affords an escape for one day in seven from the noise, bustle and care of the world, especially for those who know not the pleasures of more questionable nature. Yet with that determined zeal which seems to be chronic with the enthusiastic fanatic to do what does not belong to him to do, and which produces effects directly the opposite of what he claims, a Legislature solemnly, at this day, enacts that it shall be a crime to indulge in this recreation on Sunday.

The motive for this legislation is somewhat thin. It cannot be the desire to protect the fish, for we all know that this is based on voluntary action, not compulsory; besides, why permit public excursions, open gardens, Sunday concerts, boating, and a host of other matters, each one of which is clearly less innocent than fishing? How comes it that cars are run, engines worked, boat-house keepers actively employed, and a host of other activities allowed, on the same platform as week days, in pointed defiance of Exodus xxi. 10, which forbids the "work" and "labor" of men, women and cattle? Will any man have the effrontery to call these works of necessity or charity, as contradistinguished from fishing? Certainly none but the bigot, and the characters of whom Mazzell speaks as motivated in their opposition to bull-baiting, not by the pain to the bull, but as antagonistic to the pleasure of the spectators.

Let these men who talk about "moral grounds" honestly answer the question, What are men to do on Sunday who toil from early morn to dark during the entire week, compelled to do so for wives and children? To them Sunday is the bright spot of their existence. For them it was designed; to give them a right to be protected in the enjoyment of it, against the oppression of the wealthy and powerful, who, but for the high mandate, would give them no rest or recreation. Are they to follow the footsteps of these rich Sabatarians who have six days of virtual leisure? This is the logic of the law.

Such laws are evil in their effects. They engender a hatred to their authors and a determination to despise and defy a religion so oppressive. Well may a legislator announce himself as "an old fogey" advocating such a law based on the principles of that class of Puritans who came to this country because they were persecuted for being religious, and whose descendants are now attempting to compel others to adopt their crude, severe notions. Such laws have never been and never can be, wholly enforced. The multitude will not obey them. The few who are reached look upon the thing as despotic, and detest the despot. No country has force sufficient to carry them out, and therefore they become mere disgraceful, as confessed weakness.

As for their effects on the subject, an anecdote is not out of place. During the Southern rebellion a woman applied at one of the stations to obtain forage for her cow. She was presented with an ironclad oath of allegiance, and was refused because she would not take it. "Well," said she, "if you think to crush the rebellion by starving my poor old cow, go ahead. When that dies, I'll fight you till I die of starvation myself." So we say: If you can make religion by taking away the happiness of the poor, go ahead. The best solace of recreation is a necessity and charity to them. They cannot and will not follow the train of mournful, long-faced, pharisaical teachers, to whom many innocent pleasures are sin and laughter and bright smiles offensive; who revel in self-castigation, sackcloth and ashes, and come threatening with their (!!!) influence those who are otherwise unwilling to bow to their notions of what the true design of the Sabbath was.

No one will dispute that necessity and charity are exceptions to the Mosaic law. The courts have so decided. In one of the cases of prominence the judge distinctly says: "The object of the law is not the enforcement of the conscience, but the protection of those who desire and are entitled to the day." Is this only the rich? "It is a law of nature," says the judge, "that one day in seven should be observed as a time of relaxation and refreshment, if not for public worship. We are told that we know where is relaxation and refreshment is to come in to the slave of the week, if such pleasures as fishing are to be prohibited as crimes. I venture to assert that wherever and whenever laws have existed prohibiting innocent pleasures on Sunday, other than as dead letters, co-exist with them have existed compulsory

religion and oppression, forbidden by the constitution of this country.

That the Legislature has the power—that they should properly have the power—to regulate the Sabbath, can hardly be gainsaid. But that is a regulation to prevent a fisherman compelling a person who don't like it to go fishing, or in other words, preventing any person improperly interfering with another's peaceable observance of the day. It is a power which should be exerted, keeping in view the beneficial object of the Creator to distinguish Sunday from the other days of the week; when the fowler, who needs it, may have recreation and enjoyment, when he shall not be forced by the oppressor, who does not need the recreation, to do any manner of work, neither he, nor his man servant nor his maid servant, nor his cattle, nor the stranger within his gates.

The Sunday divine law is to check legislators themselves, and prevent them from oppressing the poorer classes and taking from them the "recreation and refreshment" they are entitled to, and any interference with them and their innocent enjoyment is a violation of that higher law, and should be so regarded.

New York.

## BLACK BASS IN NEW HAMPSHIRE.

[Read before the New Hampshire Fish and Game League by Hon. W. H. P. Norris.]

THIS game fish, *Micropterus salmoides*, or as classed by Dr. Henshall, *Micropterus togata*, the small-mouthed bass, now so well known to us as the bass in Central and Southern New Hampshire, was a stranger to our waters but a few years ago, and is to us the substantial result of the labors of the fish commission, and that board of gentlemen will pardon me if I say their introduction is the only practical result in which the fishermen has shared the benefit. To be sure we have demonstrated to us that the salmon will ascend our rivers through the several winding fishways, and being relieved of its weary return again to the sea, but he may be an erratic fisherman who would wish to ascend in the almost forlorn hope of capturing a specimen of this excellent fish; while in nearly all of our streams and lakes he may well expect to meet with success in bass fishing.

Bass were first introduced by the fish commissioners to our waters, from Lake Champlain in 1868, James Messersmith, Seneca, Penacook and Echid, and Buford, Wilson's and Peluchio were the first stocked. In 1870 and 71 waters in Meredith, Canaan, Westbury, Cummington, Hillsborough, Hillsborough, Warner, Sutton, New London, Andover, London, Croydon and Concord were supplied. Previous to that time I fear that they had been placed, by private enterprise, in ponds near Wolfeborough as early as 1844 or '65, and about the same time in Milton Three Ponds in Milton. Since 1871 about eighty waters have been stocked by the commissioners, including Black and Contoocook rivers, until now every stream of considerable size south of Grafton equally is well stocked by the fish running out from ponds and lakes. All this has been accomplished without aid of artificial hatching. Indeed, as Seth Green, that veteran authority on fishing and fish, well says: "Their natural increase is so great and their growth so rapid that it is better to leave an object to fish-hatchers to attempt their artificial propagation."

That the wonderful increase and prosperity to every stream of fish should be a cause of congratulation to every true sportsman would be expected, and that every lover of fishing should rejoice at the result, we would well believe; but, strange to say, the grumbling and croaking of some, either from malice or ignorance, have raised a cry against the bass, and prejudiced many against the fish that should be its warmest adherents and friends. I have tried to analyze the reason for this cry, and can only reach one conclusion. It is in short, "sucker game."

The traders of the fish are unable to catch them, for no one who has ever felt the rush of the bass, listened to the click of the reel and hissing line, seen the gleam of the fish as back and forth he rushes to escape from the cruel steel, watched him as he leaves the water with a mighty bound and with bristling fins shakes his open jaws to relieve them of the hook, and thus in ever-varying devices fights long and hard against the fish, till at last weak and exhausted, he rests in the landing net, could ever join the ranks of those who mourn the introduction of this fish, that by his peculiar fitness for our waters must be many years be acknowledged the game fish "par excellence" of America. The time allowed to me is too limited to be occupied in a criticism of those who say "Bass won't bite," and fear that chubs, suckers, horn-points, pickereel and flat sides will be exterminated by them, except to say that by a careful study of the bass and the use of suitable bass tackle, they are by and by led to see their mistake, they will then be as strong adherents to the right as they are now opponents. The habits of the bass should be studied well by the fisherman. Leaving their winter quarters in deep water, about a month or six weeks before spawning, they can then be found in shallow parts of the lake or pond in schools of large numbers, but soon afterward pair off and prepare for breeding. The spawning season in this State is a female deposit her eggs, generally from the 15th of May to the 15th of June, varying according to the lateness of the season, the spots selected for their nests being a gravelly or sandy bottom or rocky ledge in from three to six feet of water. These beds or nests are saucer-like depressions, usually about twice the length of the parent fish, and formed by the bass by fanning and scouring from the bottom all refuse and vegetable matter and the fins in the tail. Some fish have observed to say, whose eggs are hatched in about eight to twelve days, the young when hatched being almost perfectly formed and about one-half inch in length.

The instinct of the bass amongst almost to parental affection in the care of its nest, and later in the defense of its young. When frightened from the bed they at once return and resent the presence of anything thrown upon it. Taking advantage of this characteristic of the bass, some worse than pot-hunters have taken in large numbers by dropping the bait upon the bed and keeping it there till the fish, as if in sheer desperation, swallows it to get rid of its obnoxious presence upon its hatching-ground. An instance of this kind of fishing came to my knowledge last season, where a young man caught seventy pounds of fine fish in one afternoon, in Wakawan Lake, in Meredith.

Leaving the spawning beds the young grow very rapidly, a year of a year old seldom in large numbers, and at two years weighing about a pound, and gaining about a pound per year until they reach their maximum weight. Six to eight pounds are said to be the limit of their growth,

although I am inclined to think that under the most favorable circumstances they will grow still larger, as in a large, deep duck pond or lake well supplied with food.

In the winter bass are undoubtedly hibernating, burying themselves in the mud, crevices of rocks, under weeds or stunted logs in deep water, as you have all observed that with the increasing cold they work into deeper water, and upon the arrival of winter are seldom caught.

Knowing this much of the growth, increase and habits of the fish, to catch them one should first of all fishing select some gravelly or rocky point or ledge, which runs out boldly into the water, and where the water is shallow, and the sunken logs and crevices, and the shelving rocks, and the large bass; get your boat into position quietly, making no more disturbance than is absolutely necessary in anchoring and fishing, with face to the sun to avoid as much as possible the shadows of the rod upon the water, and then keep quiet, devote your whole attention to fishing. I believe quiet and careful fishing to be important if you would be successful.

You would ridicule the man who started out for trout accompanied by a band of music to escort him around the lake, or down the stream, yet many good trout fishermen fish for bass as though the fish were both blind and incapable of hearing. While less timid than the trout, which darts away at the sight of a shadow or a strange object, the bass is hardly less suspicious, and while standing his ground boldly, he seldom, if ever, is captured while his suspicions are aroused. For this reason his opponents, fishing for hours, perhaps, in plain view of the fish, singling and shouting the fish away, catch but exclaiming at his obstinacy in not willingly and foolishly coming into the boat, are heartily all sides, saying, "Bass ought to be cleaned out, they won't bite."

No reasonable man would expect a game fish to do so under these circumstances. That they are thus very much a breeze that will ripple the water almost a necessity, and one of the requisites of a good day for bass fishing.

One other word about the time to fish. Don't fish the next day after a severe cold storm, when the water has been disturbed and is cold and cheerless. Bass like best when the water is warm. Select a day after three or four days of extreme heat when there is a fine ripple on the lake, and you have the model day.

For bait the hellgramite, frog, minnow, cricket, grass hopper, worms and shrimp can be used, but I have found the most successful in the order named. The hellgramite, a flattened and repulsive-looking worm, generally two or three inches long, has six legs, and a head, while the body is composed of rings, has a fringe that has the appearance of legs, with two hooks for a tail. They feed upon decayed wood and vegetation, and can be found under flat stones, sunken plank and other submerged objects in the shallow portions of a stream. They are a reliable bait, living a long time on the hook, and can be kept alive a long time in a box of damp, decayed wood. Frogs are easily obtained and they are a bait that has been used with great success. The striped bass from its preference when the body is about an inch long. Hook them lightly through the skin of the back or through the body between the hind legs, so as not to injure them, and allow them the free use of the legs to swim about in the water. When rightly hooked, they will swim as readily as though not attached to the line, and make a very tempting and attractive bait. I have seen a bass rise for a frog swimming in this way, from a distance of thirty feet, as eagerly as they rise for a minnow.

When using the frog, or other large bait, be patient, and do not strike your fish too quickly. He will often start away with the bait and then stop in a manner that will lead you to believe he has dropped it, but on drawing up the line you will feel a succession of slight jerks; if so let him have it longer, for he has the bait crosswise or reversed, in his mouth, keeping your thumb on the reel so as to feel his every motion, and when he starts away after this short pause, then strike, and you have him well hooked. Then, of all times, the angler must keep cool. Don't hurry your fish; the longer he plays the more sport you have. Give him only as much line as he takes in his rushes and recover it as quickly as possible, being sure to keep the line taut at all times unless, after one of his magnificent bounds from the water, you lower your tip as he falls to recover the strain again as soon as he is in the water.

When he is thoroughly exhausted, and not before, take in your fish, I encourage to bleed him as soon as he is in the boat; then if you keep him in the shade, when dressed and on your table you have a fish of which you may well be proud.

A short, light rod is the better bass rod, a nine-foot lancewood rod with ash butt being the best I ever used for bait fishing. A rod of this length can be made light and easy to handle, and yet as strong as desired. It is elastic, strong, and the fish as a fly-rod, since it will more easily and securely than when longer and, as a consequence, heavier. Always have a good working reel with about a hundred feet of line and a good supply of leaders and hooks.

Of the great variety of hooks I have found the Smeek head the most desirable, although the sprout and the O-shaughnessy hook will always be found reliable. I will not discuss the fish as a fly-rod, since I have never learned that in fishing in this way any different rules should be laid down than those that govern flyfishing for trout or salmon, and for the additional reason that I have come to believe that the larger fish are more likely to be captured by bait-fishing.

When well equipped, treating the fish as an intelligent inhabitant of the water, and a prize well worthy of capture, and in whose capture you must use the best judgment, and all your cunning as a sportsman, one can find no better or more desirable sport than angling for this fish, that pound for pound is the gamest fish in America. He is eminently an American fish, with habits and characteristics peculiarly his own. With a hardiness far surpassing the trout, combined with all his dash and vigor, the strength and leap of a salmon, to which he has joined a system of fighting known to no other fish of his class, I believe, I think, to give him the place of our loved trout, that are yearly becoming less, by force of circumstances, occasioned by climatic changes, the gradual drying up of trout streams and the increasing number of fishermen, that from all parts of the Union crowd into our State during the summer season.

In what I have written I have not intended to eulogize the bass, but simply to give him the credit that I believe belongs to him as an excellent fish, and in the future destined to be the fish of our state, and if by this short essay some one who is now his opponent should be led to fish more understandingly, and thus meet with success, I shall be satisfied.

## LAKE SUPERIOR FISHING GROUNDS.

NOTICE that "Angler," in a recent number, inquires about trout fishing in the vicinity of Duluth, in case that does not permit of his going to the Neigong. If he will leave the boat at Bayfield, Wisconsin, he will be central to some good fishing grounds, both trout and bass. About one day's drive from Bayfield will bring him to the Brule of Woods River, said to be one of the best trout streams in Wisconsin, and which is visited by St. Louis anglers every season. The little river has fine pools which afford the fly-caster a fine field to try his skill.

The country is wild, and a camp outfit will be in order; also a boat or material to make a raft. Bass fishing is not good, but the fish are plenty, and fine ones, too. On the road will be passed Pike Lake, one of the finest lakes in the Northwest for bass fishing. I have fished in many of the Michigan lakes, but this, in the language of our tourist, "lays over" them all for bass. There are plenty of deer, and if the angler is possessed of a shotgun and ordinary skill he can have some grand sport jack-rabbit shooting.

If after landing at Bayfield he prefers easier work he can take the tri-weekly tugboat to Isle Royale, up the north shore, and will be assured of some fine sport and the largest speckled trout in North America, not excepting the Neigong beauties; or he may take a sailing yacht and skirt along some of the coast, and will be rewarded with a fine sport, with fine fly-fishing for large trout in the deep, shallow holes along shore until he reaches the mouth of the Brule (Iron-Range), mentioned, and which he may then ascend with his small boat for river fishing. Or if the angler would new fields explore, he can take his outfit aboard the train of the new railroad just completed to Bayfield within the last eight months, and go back in the Wisconsin woods where he will find the best of the whole streams stocked with now or less spotted trout. There are good hotels in Bayfield, with fish and venison every day. It is a high, dry, healthful location, with the best of water and central to any amount of hunting and fishing grounds. At least I found it so last August.

BOWLING GREEN, APRIL 24, 1888.

## TROUT FISHING.

I HAVE been fishing, and after getting out the much abused angle-worm from the cellar, where it has been carefully and faithfully taken care of during the winter months, and seizing rod and reel, I started for a favorite stream. Everything seemed in my favor, for alas! my hopes were to be crushed. On coming to a favorite pool where the brush was too thick to progress, I gathered up my big boots, stepped in and waded a short distance and made a cast. As my line and fishing worm went over a little fall, oh! what a nibble. With considerable "supposed" caution I made one step, and the entertainment began. Kersche! Down went the supposed fisherman, and some of the contortions of body and high kicking would have secured a large amount of merriment could they have been repeated in the tumble. I had by a very nice movement stuck my rod in the opposite bank, and after gathering up myself and rod, I found the tip broken, not a very fine condition of things.

But to my "speckled beauties." On getting my line in hand I found that the fish was making things somewhat interesting. He must be a "whopper;" if he breaks away he would weigh two pounds sure. Now a dash under a rock, then under a log, now sailing. "Now you can come in and see your humble servant. Oh! what a fine — sucker!" Could my friends have seen my "pliz" they would have said I was about to visit a dentist. After going ashore and leaning against a stump I took a very careful inventory of dry goods, and found that wet goods were considerably ahead. My collar was the only thing dry about me. The music which issued from the base of that old stump was not "Pinafore" made by a long chalk.

But the cover gone, also my pal angleworms, rod broken, wet to the skin, and somewhat lame from the "contortions," what to do was an important theme. After mature thought and considerable exertion "Home, Sweet Home" came to my mind. Did I tell anybody? Not much.

A short time after I tried it again, and in endeavoring to eclipse all previous efforts in securing a larger creed of fish, I gathered up all the implements of warfare, including a number of worm hooks, which were undoubtedly manufactured in the upper story of the factory, for they seemed to have an inclination to "ascend upward" on the slightest provocation. I will warrant them to get three falls out of five on any ordinary occasion. On reaching the bank of a very nice looking stream I made my maiden cast, which consisted in casting myself, with the aid of the No. 123 and a clay bank, into the raging water.

It was a difficult piece of engineering, and after the absorbing process was completed, I made a break for the bank and at last stood on it. After getting drained I heard voices, and turning my moistened optics I saw some ever-present "small boys" were with me. Small boy says: "Fell in, Mister, didn't yer?"

Fisherman. "How the dickens did you know I was fishing?"

Small boy. "Marm seed you coming down the road, and she said, 'Oh, boys, there is that city fellow again; now you go out and see he does not break his neck.'"

Fisherman. "Now you run home, little man, for there is liable to be an accident to some member of your family right away."

Small boy. "Ain't you the fellow they make so much fun of, and say you can't catch frogs nor nuthin, and —"

Fisherman. "Get away! I don't want to hear no more of that. I'll go home and get you to come down, for everybody says you fear down more fences and scare the fish more than a menagerie."

Fisherman. "Not another word," and away skips the future president.

Another very difficult cast and away goes the line. In passing over a stone something seizes the bait, and the reel is humming, until my line is so taut that I can't move. On giving the line it does not stir the unknown, and I wonder what under the sun I have hooked, and I keep running down stream. Something has got to be done, or we shall be down to the Gulf Stream. Another twist, and had there been a young cat at the other end I could have stopped him just as well.

Ha, ha! he slows up a little; now for the work, for I must have considerable of it in me for there is surface water. I begin to reel in, and another start down the stream follows. Not having any rations nor boat, it was imperative to have an understanding with the other end of my favorite line.

When you get in that deep water you and Flick Flick

must settle the question who is victor. Slowly my fish makes for the opposite bank, and breaks water while I was wading out my eyes, which had become dim with perspiration, and could not see his gliding sides.

What's the trouble now? Everything is quiet except the writer. One more twist on the multiplying reel; not a start; snubbing I presume, and after cudgeling my brains for a reason why the fish did not do something, I followed up my line, coming nearer every moment to where the thing broke water. I threw a stone in and nothing moved; but something had a mortgage on my line, and I wished to foreclose.

How is this? My line is under the bank and I cannot see any fish; another wonder. My fish must have found a new route, as on close inspection there seems to be a hole in the bank and my line is in that. One whoop! and the aforesaid "par" came up; having been watching me at a respectable distance. "Now you be kind enough to go up to the house and get a spade, for this fish has got to come out." The spade duly arrived and also my very extensive family, and the fisherman was not feeling well leaving the "shakes," and wishing some of the visitors could indulge in them.

After much hard work we brought forth the "largest, plumpest"—muskrat you ever saw, being hooked in the stern.

P. S.—My gun boots and other fishing gear are for sale. HARTMAN, Conn., April 29. F. F.

## SALMON IN BRITISH COLUMBIA.

FROM the "Guide, or Travels through British Columbia," by Newton H. Chittenden, Victoria, we take the following: "I have read, with much allowance, accounts of the difficulties of salmon fishing in the smaller tributaries of the Cnapqua, Columbia, and Fraser rivers, but after what I have witnessed to-day, am prepared to believe any fish story within the limits of possibilities. Arriving at Emory, five miles below Yale, two young men from San Francisco reported immense numbers of salmon at the mouth of Emory Creek, a small, rapid, mountain stream flowing into the Fraser just above. Going there I found it packed so full in places that I counted while standing in one position upon the railroad bridge, over four hundred fish, and salmon. Mentioning the matter to a resident, he remarked: 'Oh! that's nothing. If you want to see salmon go to the next creek beyond.' Reaching there, after a walk of about four miles, and taking a central position upon the bridge crossing it, I counted, without moving, over 900 salmon. This stream plunges down the mountain side with a fall of, probably, one hundred and fifty feet within a mile and a half, being from five to ten yards in width. For a distance of several rods up from its mouth, the salmon are crowding in from the muddy Fraser, now again rapidly rising, almost as thick as they could swim, and in their desperate efforts to ascend the successive falls above presented a spectacle never before witnessed by the oldest native settler. Mr. John Woodworth, who has lived here for twenty-four years, says he never heard of the like. The salmon is a fish of extraordinary strength and agility, and are said to jump and swim up perpendicular falls from ten to twenty feet in height. I stood upon the bank an hour and watched them in their desperate struggles to make the ascent of several of lesser size within sight. Of hundreds which made the attempt, only a few, comparatively, succeeded, but fell back exhausted, splashing and whirling among the boulders. Many were covered with great bruises, some had lost their eyes, a few lay dead upon the shore, others were dying, and all seemed nearly worn out. Stepping close to a packled with them, I easily caught two in my hands which offered but little resistance. Before leaving, a photographer, Mr. D. R. Juddins, of New Westminster, arrived and took two views of the remarkable scene. Mr. Daniel Ashworth, wife and family were also present. Reaching Yale I told a hotel-keeper about it, estimating the salmon at thousands. 'Thousands!' he exclaimed, almost with indignation, 'why, there are millions of them now running up the Fraser, within a few miles of the mouth of the river. One of London's construction train I rode along the river, fifteen miles to the end of track. Millions were probably not much of an exaggeration, for although the river was quite muddy, schools of salmon, numbering thousands each, could be seen from the platform of the cars, at short intervals, the entire distance. The Indians were catching and drying them in large quantities. Standing upon the edge of perpendicular projecting ledges, they capture the largest and finest specimens, either by means of hooks or scoop-nets, dress them upon the spot and hang them up on long poles to dry in the wind and sun. When sufficiently cured they are packed in caches made from cedar shakes, and suspended for safe keeping among the branches of trees from twenty to fifty feet above the ground. It is the opinion of those familiar with the habits of the salmon, that not one in a thousand succeeds in depositing their spawn, and that if hatching places were provided upon the river, and protected, that they could scarcely be exhausted, under proper restrictions as to catching them."

## STUNNING FISH.

FROM a paragraph in your April 12 issue, there seems to be a doubt, in the minds of some persons, as to the truth of the statements sometimes made that fish are killed by a ball striking the water near them, or of the influence of a wound. It is not uncommon for hunters, or shall I call them fisher-men, to take the black bass of the St. John's, in this neighborhood, by watching for them and shooting them with a rifle in the shallow water, in the spring of the year, and killing them by firing at them, but seldom hitting them. They will be stunned long enough for the sportsman to go out in a boat, if he is on-shore, and secure his game. They find that the best time to shoot is when the tail of the fish is toward you.

We also hear of persons having been killed or seriously injured by the wind of a ball, as it passes in close proximity to the head. This statement has, I think, never been corroborated; but what appears to have been a very remarkable instance of it, in the case of a lower animal, happened here this spring. A gentleman fired at an alligator a little over three feet long with a rifle of .32 caliber. The animal immediately disappeared without the usual connection to the water when wounded, and the gentleman found him at the bottom apparently dead. He could only have been wounded in the head, if anywhere, as that was the only part out of the water, and he was shot at very short range, but not the slightest trace of even an abrasion of the skin could be found. In a short time he completely recovered, and turned out to be a remarkably vicious specimen, jumping and snapping at persons coming near him, like an irritable dog. I had him

in my possession for some days, and he now adorns my hall as a stuffed and far less troublesome specimen. We might, perhaps, naturally expect that the concussion would be much more severe in the case of the alligator than most other animals, since its size, in a reptile of that length, would about equal that of the bullet, the brain of the largest alligator only weighing a few drams.

F. D. LESTER.

PALATKA, Fla., April 22.

## ROD AND POLE.

THE editorial on "Rod and Pole" touched upon an abuse of names that all anglers have suffered from, but on which they have been silent. I have heard men who owned fine rods call them "fish poles," and they were men who were informed on other subjects, and from whom one would expect better things. No matter what Shakespeare may have said on the subject, a rose would not be as sweet if called a skunk. As the late George Dawson has said, "it is not all of fishing to fish," and things used in sports should be called by their right names. We would not call a fine fowling-piece a musket, nor a canoe a scow. Many of our sports have names that have been in use since they were first thought worthy of being written about, and a misuse of them denotes either carelessness or an ignorance of the literature of sportsmanship. In most cases it is the former. Not long ago I heard a man who has read *FOREST AND STREAM* from its first number speak of the trigger of his gun as the "tricker," but I am confident that he would not have written it so. Mr. Endicott's definition of a pole, which you give as a stick with bark on it, is good as far as it goes. I would include all stiff natural sticks which haul a fish out by "main strength and stupidity" in the category of "poles," but I rebel at that term being applied to a rod fit to play a fish, whether it is in one piece or in six, or whether it is a manufactured article or a natural bamboo cane.

R. N. F.

CHICAGO, Ill.

"I would refer your correspondent, who wishes to know if 'rod' or 'pole' is the correct term for his angling implements, to Webster. Under 'pole' he gives us carriage-pole, liberty pole, may-pole and bean-pole, but not fish-pole. Under 'rod' he gives 'The shoot or long twig of any woody plant, a branch, or the stem of a shrub; as a rod of hazel, of birch, of oak or hickory. A slender stick; a wand. \* \* \* A support for a fishing line.' I do not remember to have heard an angler call his rod a pole, but I have heard country boys speak of a pole as a fishing stick, and I am calling my rod a fishing-stick as to term it a pole."

ROCHESTER.

I notice your editorial article of April 12 relating to "Rod and Pole." Please accept any good rod-maker if he makes fish-poles. If he does not jump up and dance around I am mistaken.

S. E. B.

REYNOLD V.

The question oft' asked by our angling friends  
As to where Rod begins, and where the Pole ends:  
Though a hard nut to crack, if you'll but give me time,  
I'll endeavor to answer the poser in rhyme.

There are many who hold that a stick with bark on  
Is a Simon pure Pole, in their learned jargon;  
So, per contra, the truth of their rule would be proved,  
If a stick were called Rod when its bark is removed.

There is one man I know, who I give to say leans  
To the belief that a Pole is a prop used for beans,  
But as he is a farmer of practical mind,  
His Rods, Poles and Acres are not of our kind.

But joking aside. As a rule I would move,  
And I hope all my angling brothers approve.  
To that settle the vexatious question in point,  
A Pole be called Rod, when it boasts of a joint.

W. R. W.

## BLACK BASS HABITS.

A WRITER in the Washington *Star* says: "The laws of Maryland prohibit taking bass during the month of May, and those of Virginia for a certain time commencing the 15th of May. I contend that the angler's rod exerts but a very small influence in thinning out the bass, and that consequently all legislation on the subject is wholly unnecessary as will be hereinafter more fully set forth. It has been about thirty years since bass were first placed in the headwaters of the Potomac, the facts pertaining thereto, as procured from one of the parties who assisted in their introduction, being as follows: Fourteen bass were procured from some of the Western waters and placed in a mill-pond near Cumberland. The stream was small, a mere creek. After some years the dam broke and a number of the fish finally found their way into the Potomac River. At this time there were no fish in the Potomac that fed on other species of fish to any great extent. The river being well stocked with tobacco-boxes (sun perch), mullets, suckers, etc., etc., the bass held a high carnival and, as a result, increased very rapidly. Consequently the river became well stocked with them before the people were aware of their presence, as they were not accustomed to fishing for this kind of fish. But, after a few years, their numbers in the vicinity of Cumberland began to tell on the fish on which they depredated, and it was noticed that as these fish grew scarcer the bass correspondingly grew scarcer. "The result of this is that in the vicinity of Cumberland the bass are not now so plentiful as they were a few years ago, and if the catch in this vicinity was totally prohibited I hazard but little in saying that they would never become as plentiful as formerly, unless some means be devised to increase the fish upon which they feed. When their supply of food gives out they turn to eating each other, and regulate their numbers in that way, even if there be not one taken with a hook or other means. I know that they eat each other, for the reason that one of the largest, if not the largest, bass I ever caught was found to have previously swallowed a bass some five or six inches long—large enough to catch with a hook. It could not swallow more than three-fourths of the little bass, there being from one to two inches of the tail protruding above its throat. Although thus gorged, it sought another bait and was caught, as stated. The swallowed bass was found to be a young one of the same Stubble Feltz, about three miles this side of the Great Falls."

"With such voracious fish prowling around how can the smaller fish maintain their requisite numbers, and unless they do this how can the bass procure the necessary amount of food without feeding on each other? Will our law-makers give us some information on this subject? The fact is that every bass taken leaves that many more small fish

for the others, and therefore correspondingly lessens the necessity for feeding on each other. Residents in the vicinity of the Great Falls tell us that suckers, tobacco-boxes, etc., etc. Keep the supply of food fishes up to the limit, and the bass will take care of themselves in spite of the angler's art. No mistake on this point.

"Another reason why the fishing laws should be abolished is that the condition of the weather and water is frequently such as to prevent spring fishing until about the time said laws take effect. During the time the fish are spawning they need no laws to protect them, for all anglers know that no kind of fish will bite at such times to amount to anything. They appear for a time to lose all desire for food, and will spurn the most tempting bait that can be offered. I have offered a hook to several species of perch while bed-ding. They would take the hook into their mouths and carry it out of their beds and drop it. No bait that could be found would tempt them into a bite. These same fish at other seasons would bite ravenously. I am credibly informed by the best that they have, in the same way, seen bass refuse the best bait that could be offered. What, then, is the use of laws to protect them at a time when they will not bite? There could be no harm in laws that would prohibit bass fishing from, say, May 15 to September 1."

"Adopt necessary measures to supply them with plenty of food and their numbers can never be materially lessened by hook and line."

"ANGLER."

DELAWARE RIVER NOTES.—The U. S. Fish Commission on the 24th deposited over 250,000 salmon fry in the head waters of the Delaware River, as I wrote you last week has done. But there is much to be feared from the black bass, which were placed in the same waters in 1870, and now occupy the stream in immense numbers. We learn that the Commissioner himself expresses a doubt that the restocking the river with the salmon which years ago naturally inhabited the Delaware, will not be attended with good results, owing to the presence of the voracious bass, which may not spare the salmon fry, and grow and propagate. Two or three years ago some of the streams emptying into the upper Delaware were stocked with California mountain trout, and protection has been given them. A few days since an urchin of Hancock took a fine specimen of this fish, which shows they have thrived. Suckers have commenced to run in numbers in the upper Delaware waters, and although before season, many large bass are now being taken. It is stated that bass were never known to be so plentiful as at present about Port Jervis. Trout fishing began April 1, but the streams have so swollen, and so much snow water is running, increased by the late storm, no one has been able to enjoy the sport thus far. Anglers may count on a good season in the Delaware valley as soon as the first spring-like weather sets in, as the storm just passed will put everything in order for a good campaign.—HOMO.

DYNAMITE FRIENDS.—While England is trying to suppress the murdering dynamite fiends who blow up buildings and endanger the lives of innocent people, our neighbors on the Pacific coast are complaining of the use of dynamite by the Chinamen, who use it to destroy fish. A writer in the Portland (Oregon) *Yer's* says: "The cunning Chinese often get up to an unlawful trick, and hope which they ought to stop to it. It is blasting fish. They do not exactly get a fish and blast it to pieces, as one might surmise from the phrase, but they first steal a stick of giant powder, then find a point in the river where they are cute enough to know the fish accumulate, and there set off a heavy blast on the surface of the water, which stuns the fish and causes them to float on the water. The long-fingered heathen soon racks in a load of fish and gets off to sea. It is really a cruel and wicked, somewhat mad, and his mouth to water, to merely waste fishing, one of these grinning, grunting gormandizers, with a bland smile of contentment on his greasy features, his little pig-eyes twinkling, his mouth split back to his ears, almost showing his long white teeth, while he trots swingingly, slowly along under a good load of fine fresh mountain trout strung at each end of a bamboo pole. If you ask him, 'What you catch 'em, John?' he'll tell you, 'I catch 'em deep 'em, long time; what four?' That's all the satisfaction one can get out of them. You go out fishing all day, but never get a bite, and come home cussing your d—ivile luck, and every pink-eyed, cruel knacker in the kuntry."

WORMS IN BLACK BASS.—West Springfield, Pa., April 23.—We have here a stream called Connetquot. It has a rocky bottom, swift current, and many deep pools. It contains black bass, rock bass, pickerel and many other kinds of small fry. As soon as the weather gets warm enough, the bass get wormy. The worm is about one inch long, and is in color a bright yellow; it is usually found under the scales, but I have often found them on the caudal fins. Later on in the summer they seem to become more numerous, and the fish are full of them. Can you tell me what they are and what causes them? The fish are unfit for use, and when so affected are not very gamy. The bass are the only fish they are found on.—MACK. [We have had several accounts of these worms, but no naturalist has worked out their life history. We have found them in perch also.]

GROWTH OF SALMON.—Manchester, N. H., April 28.—I am very skeptical as to the supposed enormously rapid growth of salmon in Scotland, as described in the article you have just reprinted from *Blackwood*. Mr. Atkins is a very careful observer, and his notes do not show any such increase; and also confirm the "biennial" theory, about which one of your correspondents, some time since, wondered at me for admitting there was to be any question. I have no doubt of it, and can take in the idea of a spent salmon increasing a pound or two in weight, and then returning the same season to spawn again, though it may be so.—SAMUEL WEBBER.

ANEST THE SALT MACKEREL.—As to that salt mackerel, skin it, and it doesn't make a bit of difference which side is up. By the way, you will remember that Anacron had supposed to say on this subject—*ὁ ἀνὰ πλάτος*, etc.—VIATOR.

AN ALL-AROUND ROD.—"Nessmuk" has defied the accepted tenets of the rod makers, and added a fly-typer where the rod makers thought it did not belong. He writes: "The rod is ready for pickerel, bass or trout. Of course, it is not a perfect fly-rod—no general rod can be. But it will take, first, pickerel, second, bass, third, catfish or bullheads, fourth, trout—either with bait or fly. I take no stock in fly-casting tournaments. Don't care to throw more than twenty-five feet of line, with five foot leader. Usually much less. Have my own notions about flies and 'casts.' My favorite cast is tail-fly, large, well-cleaned red anglerworm, with bit of white pork for head. Two feet above a red hackle, queen, or royal coachman, according to water and light. Fifty years' experience has proved to me that the above bait fly takes three-fourths of the trout. Red hackle is the best best.—NESSMUK.

TENNESSEE NOTES.—The glorious and wise law-makers in our General Assembly repudiated one-half the debts, compounding with the defaulting State treasurer, licensed gambling at poker, seven-up and horse racing, and amended the very lenient fish laws so as to permit giggering, schling, truppering, etc., to be carried on at will. Fishing and hunting may be considered dead here for years to come, and our sportsmen will either have to seek recreation elsewhere or burn up their tackle and accoutrements, for they will never need them more in what, with rational protection, would be the finest place for game and fish on the American continent.—J. D. II.

SALMON IN OREGON.—Vancouver Barracks, April 18.—The salmon catch thus far is reported as very light, \$1.10 being paid by the canneries for each fish. Four years ago fifty cents per fish was the price. Few if any salmon reach the Portland market. I was informed yesterday that there were 350 miles of seines stretched in the Columbia River every night except Sundays. Comment is unnecessary.—T. E. W.

BOOKS.—Mr. Westwood has written an introduction to the "Secrets of Angling," by John Denny, which will accompany a reprint of that poem. Mr. W. Satchell will print it, as also a new edition of the same gentleman's "Chronicle of the Complete Angler." The Orange-Jude Co. have republished the "Scientific Angler," by the late David Foster, with notes by W. C. Harris.

CARE OF WORMS.—Good, lively bait can be made in the following way: Wrap up some of the common earth worms in a piece of carpet or thick cloth, put them in a box full of dirt, and leave them for two or three days. At the end of that time they will be a bright scarlet color, and when you open the cloth they will spring about one-half foot in the air.—M. L.

THE TARPUM AS FOOD.—A correspondent writes to know something of the edible qualities of the tarpum. We have never eaten it, and do not remember to have seen any allusion made to its food qualities. It looks like a good, wholesome fish, and doubtless many persons have eaten it. Who can give us some information on this subject?

ROUTE TO THE NEPHEW.—Prince Arthur's Landing, Lake Superior, April 14, 1883.—In answer to "Angler," re "Route to Nepigon," in your last issue, come by way of Duluth and Prince Arthur's Landing, and take boat to Nepigon. Good fishing anywhere from mouth of river up stream.—J. J. O'G.

BLACK BASS IN THE POTOMAC.—Falling Waters on the Potomac River is said to be a prime ground for black bass. This point and all the way up to Williamsport, on the same stream, I am assured, can't be beat for large fish.—Homo.

THE GRADY BILL WAS DEFEATED.

## Fishculture.

### SALMON FOR THE DELAWARE AND HUDSON.

LAST week the United States Fish Commission sent a car of 25,000 salmon fry to the waters of the upper Delaware, and the shipment is to be followed by another of the same size. Prof. Baird intends to test the possibility of acclimating salmon in both the Delaware and the Hudson, and hatcheries to the headwaters of the latter river in a few weeks. The fish are the Eastern salmon, *S. salar*, the eggs of which came from the salmon breeding works of the United States Fish Commission at Bucksport, Maine. It is well known that the rivers of Connecticut and the southern limit of the salmon at the discovery of the country, but it is possible that in the Hudson and the Delaware the difficulties in the way of the salmon were merely mechanical. The falls on these rivers presented a bar to their ascent to the streams above, which contains insect and crustacean life necessary to the growth of the fry, as well as suitable spawning grounds. By placing the young in the trout brooks in the Adirondack region they should find all the conditions requisite to their growth and descend the river to the sea at the proper time. There seems to be no good reason why the rivers named may not become salmon rivers in time, if the stocking is carried on for a few years. The experiment is comparatively inexpensive and is well worth trying. Should the fish survive and return, they will be captured in the lower portions of the rivers, for obstructions above forbid their ascent to the brooks. We shall watch the trial with great interest, and hope that our country may find a new source of supply, may hereafter observe that show the presence of salmon in the rivers. Stray salmon have been taken in the Hudson as high as Troy, and a few years ago some four or five thousand fish were placed in the Delaware and several adults were afterward taken, showing that the temperature and chemical conditions of these rivers are not fatal to this fish.

My election to the United States Senate has been a great satisfaction to me, of course," said Mr. Knapp, of West Virginia, to some friends who were congratulating him recently; "and I, of course, am very grateful to my friends for it. But I tell you frankly, gentlemen, that neither it nor any of the steps rapid promotion may political career has given me so much genuine pleasure as the fact that my bound pup took the premium at the dog show the other night."

In the will of the late Richard O'Connor, Falls of Schuylkill, Pa., is a provision to the effect that \$10 a week be paid for the support of his dog Spot, the remainder of his estate being bequeathed to the German Catholic Society of St. Joseph.

## The Kennel.

### FIXTURES.

#### DENCH SHOWS.

May 8, 9, 10 and 11, 1883.—Westminster Kennel Club, Seventh Annual Bench Show, Madison Square Garden, New York City. Entries close April 23. Chas. Lincoln, Sup't.

#### FIELD TRIALS.

November 19, 1883.—Eastern Field Trials Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1. For the Members' Stake, Nov. 17; for the All-Aged Stake, Nov. 1. W. A. Coster, Secretary, Flatbush, Long Island, N. Y.

December, 1883.—Kalamazoo Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Bryson, Secretary, Memphis, Tenn.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

### THE NEW YORK SHOW.

THERE are, including the puppies, 1,130 entries for the Westminster Bench Show next week. These entries are distributed as follows: 41 mastiffs, 42 St. Bernards, 5 bergs, 8 Newfoundland, 20 greyhounds, 5 deerhounds, 112 pointers, 159 English setters, 50 black and tan setters, 97 Irish setters, 7 Chesapeake Bay dogs, 6 Irish water spaniels, 8 field spaniels, 15 cocker spaniels, 10 foxhounds, 10 beagles, 6 dachshunds, 71 collies, 25 bulldogs, 56 fox-terriers, 80 terriers of different breeds, 49 pugs, 6 King Charles spaniels, 2 Bluejays, 2 Japanese spaniels, 6 Italian greyhounds, 36 in miscellaneous classes. The judges, already announced, are:

For Irish setter, black and tan setters, John C. Higgins, Esq., Delaware City, Del.

For English setters, pointers and foxhounds, Maj. J. M. Taylor, Lexington, Ky.

For spaniels and small non-sporting dogs, J. F. Kirk, Esq., Toronto, Canada.

For mastiffs, St. Bernards, bergs, greyhounds, deerhounds, dachshunds, and other large non-sporting dogs, James Watson, Esq., New York City.

For collies and beagles, Dr. J. W. Downey, New Market, Frederick county, Md.

### FORM AND COLORS OF SETTERS.

Editor Forest and Stream: Col. Stuart Taylor condemns the setters and pointers exhibited in New York last year, because, with many other faults, they were "too narrow." Now, I would like to inquire if in this he speaks in accordance with the highest standards for which he professes such deference. "Stonehenge" says the chest should be "deep rather than wide." Idstone says, "I dislike a wide chest—I never saw a fast dog with one." And again, "The dogs that knock up and refuse to hunt in wet weather are always square-built, wide-chested ones. Those with a deep chest, ragged ribs, and which are as narrow as a rail, are always ready to gallop and never trot, which is a sign of distress." At the first trial in the field ever held, the worst goer was the strongest and squarest dog there—a white Dandy, a ragged, narrow dog, hunted bravely in spite of his "weak appearance" upon which some of the bystanders insisted. Has the view expressed by these authorities been discarded?

Col. Taylor also says the dogs at the New York show of '82 were a "wretchedly colored" lot. I wish he would be more drastic in his criticism, and tell us just how their color was faulty. From the 120 entries, the 172 entries of English setters may be classified as follows:

Black and white, blue belton, etc.	58
Black and white, blue belton, with tan	41
Orange and white, red and white, etc.	29
Lennox and white, lemon and white, etc.	17
Liver, liver and white, liver and tan, etc.	12
Black, black and tan	3
Color not given	3

The colors Col. Taylor particularly objects to seem to be lemon and white and liver and white. There does not appear to have been any preponderance of either. By the way, speaking of liver color, if he means to say that it is a color, the time when liver and white was not a recognized setter color, I think he is mistaken. He speaks of it as a color only for spaniels and pointers. But it is generally believed that the setter is a spaniel. A "setting spaniel" he was formerly called.

### BREEDING FOR SEX.

THAT there is a very general desire among breeders of domestic animals to possess the power of regulating the proportion of the sexes at will, I think, made evident by letters on the subject which appear from time to time in your Journal and others devoted to the interest of stock owners.

In regard to poultry, one tells us that the more globular-shaped eggs will produce pullets, and the more oblong the cockerles, while another says that if the eggs are looked through by a strong light, so as to show the position of the seminal clot, a whole clutch of hens may be secured by rejecting those eggs showing it on one side, and selecting those wherein its position is at an angle. I presume we may brush aside both theories as purely fantastical.

In regard to dogs, we are constantly being reminded of the old, and I had thought exploded, theory, that the sex of the produce of an alliance depends upon the position which the alliance takes place—that is that if the embrace is permitted during the early days of heat, the whelps will be mostly bitches; if about the middle of the period the sexes will be about equal, and if toward the end nearly all will be male pups.

In your American contemporary, FOREST AND STREAM of the 8th ult., a case is recorded of a litter by the well-known collie Marcus, the dam of the litter having visited him at the commencement of her heat, the result was nine puppies, all bitches but one.

I remember some months back seeing a letter in the Journal from the Rev. E. Spencer Thideman, recording a somewhat similar result in a litter where one instance with his Dandie Dinmonts; and all of your readers must have had instances in support of the theory brought under their notice.

I must say I can place no faith in the theory dependent for support on comparatively isolated facts when I find that the results are opposed to the largest collections of facts at our disposal.

No man would do so much to a summer—and if I may digress a moment, neither to five-for—in September, 1881, that number left my house, and beaten back by the gales, which readers will remember as exceptionally severe at that time, returned after being away just a month—returned to find his home occupied by the sparrows, who had filled it with hay and bits of string, and a piece of the latter getting run round around the leg of one swallow as he left after an inspection of the nest, he hung suspended for a short time, and so impressed the bird with such fear, as I presume, that all, after a short fly round, disappeared. Fear to pursue.

But to return to the dog question, it appears to me that to establish the theory, none but males in the one case, and none

but females in the other case, should be produced; or otherwise the theorists have contradictory fact to deal with which they will find hard to explain.

So doubt it would be considered a very convenient thing if we could arrange the comparative number of the sexes at will; but I fear the theorists have in this, as we are all apt to do in so many things, allowed the wish to be father to the thought.

Dairy farmers would take very good care to secure good breeding seasons, if they had it in their power to secure all quacy calves; and dog breeders, who sell, would take care to have mostly dogs, and only enough bitches to secure what is necessary to consider a sufficient multiplication of their particular variety.

Fortunately, as I think, fanciers can do nothing of the kind any more than they can produce colors at will by exposing to the vision of dogs excited by the sexual passion, such as they desire the progeny of the union to exhibit; for, however venerable that theory may be, I suppose it has, in most intelligent minds, melted like snow before the sun of a clearer knowledge and a higher appreciation of the wonders of creation, which is its natural and appropriate result.

To come to collated and registered facts as to the relative numbers of the sexes in dogs, there is one point which, in considering the figures I propose submitting, should not be lost sight of, although I am not prepared to say it has any effect or influence upon the results. The fact I refer to is, that in the system of dog breeding that prevails, the dog is computably more polygamous than he would be in a state of nature, or perhaps it would be more correct to say that procreation in the case of dogs from which statistics are taken is restricted to a comparatively speaking few that are of necessity polygamous; while the generative impulses of others are compulsively repressed. Darwin gives the births of 6,882 greyhounds, consisting of 6,035 males and 847 females; that is in the proportion of 110.1 males to 100 females.

I have lately counted up the number of puppies of all breeds (but, practically, greyhounds, foxhounds, harriers, beagles and some other breeds are excluded) to be 2,491, consisting of 1,794 males and 1,452 females, or a fraction over 1 per cent. excess of males.

What the proportion might be in a state of nature or even under domestication did unrestricted intercourse between the sexes and all sorts of sexual excitement, and all sorts of reason for supposing that the proportions would be materially altered. What we want is a far larger body of facts, and I wish now to appeal to you, sir, to give us the result of the registration of your dogs, and the statistics, and the interesting events. If I remember rightly, your registry has been in existence some three years, and the figures accumulated must be great. No doubt in your registry, and that of your contemporary, there will be some duplicates, but not, I should think, to the extent to materially interfere with conclusions to be drawn from the facts recorded.

I think, too, it would also be of great benefit if we could have statistics, from the heads of your several departments, of horses, cattle, sheep, swine, rabbits, cage-birds, and poultry, as these embrace both the monogamous and polygamous.

I should be glad to see the opinions and the experience of breeders expressed in your columns on this very interesting and important subject, so that by the free exchange of thought and of acquired knowledge we may each add to the store of the other.—Hugh Dalziel in Live Stock Journal.

### NEW YORK FIRE DOGS.

[CONCLUDED FROM PAGE 252.]

MIKE J. McNAMARA, driver of Engine No. 23, at 255 West 43rd street, owns a nice little St. Bernard called Nellie. She is about four years old. She does not run to fire, but has been taught to trip the lever which connects with the machinery that unlatches the horses and throws open the doors of the engine house and around the engine, the dog jumps up and catches a rubber ring in her mouth. The instant her weight pulls it down the machinery is set in motion. She then darts behind the two horses in their stalls, which are situated on each side of the engine, barks at them until they go to the pole, and then runs back to the yard behind and drives the horse to the hosecart. When the reporter called at the engine house Foreman David Conner permitted Nellie to "trip the horse" a number of times. All these things are well trained, especially the officers, and in five seconds' time Nellie would pull down the lever, back out the horses and retire to a place of safety on the stairs. The horses were hitched to the pole and the men were at their posts in exactly three seconds.

One of the most famous dogs is Jack, a three-year-old coon dog, who was born and brought up in the service. He is wonderfully intelligent. Jack belongs to Hook and Ladder Company No. 6, at No. 77 East Canal street, of which John H. Kellogg is foreman. Jack goes to all fires, and is first to hear the buzz of the telegraph. If up on the third floor when the call comes he is the first member of the company down. He never dresses, but goes to the fire as he is. Jack always dresses in the first flight of stairs like an ordinary Christian, but in his anxiety to get to the horses he rolls down the second flight. He drives the horses to the pole and runs ahead of them, barking. Jack is known to thousands of persons, and his barking informs them that there is a fire in the district. He is clear-headed, strong, and game better than a man could. Jack is always first in the building. At night he looks for the fireman's light, and often when the smoke is thick and he cannot be seen the men know he is about by hearing him sneeze. If there is a fire and the apparatus does not go out Jack sits down and howls in his disappointment and cries as if his heart was broken. Sometimes the horses slip on him, but he keeps on three legs and goes to the fire. One time he gets home he is laid up for days. He has been known to go up and down the fire escape and walk up and down a peaked roof that was at an angle of forty-five degrees. He will go anywhere the men do. At home he is fastidious, disliking the smell of the smoke and the noise of the fire. He is very clean, and when he goes across the street, where he sets up a howling until the cleansing is over. But at fires he does not mind the densest smoke or the heaviest shower bath. About a year ago Jack was in a fire in Gold street, where he was on the fifth story down to the floor beneath, but he was not injured. A short time after this there was a fire at the corner of Albany and West streets. The water was about five feet above the fire. Jack saw a large armchair in the room, which he proceeded to occupy. The smoke began to dense the men were driven out, but Jack refused to leave and the men had to go back and carry him out. In domestic life Jack is looked upon as a great asset. He frequently accompanies his master to dinner, and sits at the table, and is a great favorite, and if all the stories told of him be true, he is "one of the boys" and the first water in the district. The story goes that he was the first to startle the men. Should any of the men be at the barber shop a block off they always hear Jack's warning bark in time to jump out of the chair and to catch the apparatus as it runs out.

One remarkable dog that has died in the service, Bill, of Engine No. 14, is remembered by the whole force. He was a large black mongrel, and originally belonged to State Senator Baulen when he kept a baker's shop in Ludlow streets between Broome and Delancey streets. One of the boys of the Bill away from his owner in the shop was kept, and he was killed by the company until 1880, when he died. He was then buried with much ceremony in the yard back of the

boom being very long. From the accompanying diagram it will be seen that this class of boat when hove down is virtually a flat-bottomed craft, and is anything in the world but a cutter, which the word means; *Fendur*, to split, and "Fendur," a splitter, or as we say in English, a cutter, which in the general sense and with respect to the principles involved means a vessel whose speed is mainly due to her facility for cutting the water; her comparatively narrow sectional area offering but little resistance, such a boat being narrow and deep.

Distinctly opposed to this class are those of great beam and light draft, or what is the same thing, those boats which have a comparatively large and broad sectional area.

It is manifest that boats of this latter class cannot rely for their speed upon the facility with which they cut through the water, but on the contrary are forced to depend upon the ease with which they glide over its surface.

All yachts and smaller-sized sailing craft fall, by virtue of their shape and weight, into one of these two classes. These two factors determine the displacement of the vessel as well as the relative positions of the centers of gravity of the vessel, and the displaced fluid upon which the stability of any floating body depends. No mere similarity of detail of any kind in construction will render similar in principle two boats belonging respectively to these two classes. They may both be, for instance, straight-timbered, as in the case of the *Fendur* and the *Onward*, but they are as widely separated in the principles governing their action as it is possible for them to be. The *Fendur* pattern, and all the deep draft boats, depend for their stability upon the low position of the center of gravity of the entire system, while the other class for the same property depend upon the buoyant effort of the displaced water, which is crowded away by the submerging of the lee side of the boat.

Carrying the analogy a little further, it will be seen with respect to the displacement of these two classes of vessels, that while one in all positions has the figure of the displaced fluid symmetrically divided by a plane through the stem and stern posts, or nearly so, the other only fulfills this condition when on an even keel; in all other positions there being a great difference in the amount of water displaced on either side of the plane referred to, until, in the extreme cases, when the light draft boat is hove down, we find the displaced fluid almost entirely to one side of this plane. To illustrate this I ask how often boatmen have looked over the windward side and seen the upper edge of their centerboard above water? and how few, on the contrary, ever saw an iron keel in that position? Did it never occur to them to consider at such a time what were the relative displacements of two such boats? In all discussion of nautical construction it should be ever borne in mind that we are dealing with mechanical forces. Their intensity, points of application and direction give us the results. The principal factors determining these points are the displacement of the vessel, and the figure or shape of the displaced fluid, as well as its position with respect to an axis or plane of symmetry.

These things make a boat's stability.

F. JARVIS PATTEN.

[We give below the midship section of the *Fendur* as it appeared in our issue of the 8th February, and a copy of the section our correspondent "G. E. N." sent us of the *Onward*, the original of which will be found in our issue of February 22.]

The *Fendur* section, and the section represented by our correspondent "G. E. N." to be that of the *Onward*, are also shown careened to the same angle as our correspondent, "F. J. P." has shown the corrected section of the *Onward*. Reading carefully the comment of "F. J. P." on this type of model, represented by *Onward*, as compared to that of the *Fendur* type of model—independent of the difference shown to exist in what the *Onward* is to that which "G. E. N." represented her to be—we need only add that all our correspondents on this *Fendur* type of model will feel satisfied that "F. J. P." has not alone made it plain that *Fendur* would be a safe sea-going boat, while *Onward* belongs to that class of model which are dangerous even in the hands of experts, but that his knowledge of the principles which should guide the naval architect is based on a thorough cognizance of the subject at issue.]

#### THE RATING OF YACHTS BY SAIL AREA AND LENGTH.

THE following remarks appeared in the *London Field* from the pen of Mr. W. Baden-Powell, of canoe reputation, will be read with great interest by all our leading yacht committees.

FOREST AND STREAM has repeatedly advised that the rule of admeasurement known in America as Commodore Lee's be adopted. It is a rule of admeasurement adopted after much investigation by the officers of the Seawanhaka Y. C., of New York, and found to work well with the many classes of boats that meet in our races—some deep and narrow, with lead keels and small area of canvas, and others of broad and shallow proportions and large area of canvas.

We quoted the Seawanhaka Y. C. rule in our issue of April 12.

Mr. Baden-Powell is evidently right in his conjecture that large displacement and small sail area will be the result. This will encourage good modelling and insure good sea-going qualities, if the design is properly calculated and balanced. It will not at the same time give all the prizes to the man who spends the most money for lead

and canvas, as long, narrow and deep boats with any quantity of lead will pay for their ability to carry more canvas than those ballasted in a manner which will leave them ships to start with, and ballasted in such a manner that the ballast can be removed for the purpose of lightening their hulls for repairs, or in the case of grounding where it is not pleasant to stop.

The boat with statical stability alone will be heard no more of, as yacht owners will soon be tired of having for their sails and crews if they cannot have accommodation somewhat equal to the cost of maintaining such flat iron types of model.

Mr. Baden-Powell's remarks about ketch rig versus yawl rig, scarcely call for comment further than our protesting against advising any more hideous rig than the yawl rig being supplanted by the ketch rig. If a man is afraid of his boat's stability, let him put a cutter where it blows hard and the sea is rough, and keep her under command until he gets the trysail out, or, if he wants to save the expense of an extra hand, let him let her go. Wind will spoil his cutter by rigging her a yawl, but a ketch rig belongs to traders, not yachts.

To do away with these wretched rigs it would be best to rate any rig a cutter if she was not over fifty feet on the water line. Mr. Baden-Powell writes as follows:

"Since it was announced, a week ago, that the first step had been taken toward taxing sail area, many bright visions have been enjoyed by those who, so to speak, inhabit the yacht racing world. The fantastic nature of some of these visions is simply appalling. With one it is the solemn funeral of the whole yawl family; with another, the glorious descent to warmer regions of those spar-breaking spirits, jib-topalls; while with a third, the 'dead March' of the 'Dead March,' especially arranged for the condemned 'lead mines'."

"That a rating by sail area—L.W. length, may, and probably will, have a beneficial effect on racing is scarcely open to question. The precise result of such a rating—in regard to its effect on construction, equipment, and performance—can only be asserted on conjecture. Apart from any possible injury to the character of the sport, any particular rig, probably the straightest conjecture is that such a rule will foster large displacement, small sail area, and moderate ballast (using the last two terms adversely, as in comparison with the present forecast, under the tonnage rule, of extraordinary displacement and lead keels; not by any means that it will place 'duffers' on a footing with 'crackles'; the main advantage of the latter performance can do that, for those who are unsportsmanlike enough to 'enjoy' witnessing such farces or to benefit by them."

"The question of rig allowance will, of course, be carefully reconsidered. Under the racing rules up to the present time success has chiefly been gained by 'setting every stitch of canvas to meet the freshening wind,' and, in consequence, many owners of lead to keep every stitch of canvas drawing. But will not the effect of the proposed rating rather incline our hearts to set less canvas, and perhaps to carry less lead? If so, we at once come to those yaws. A yawl's sail area is generally about the same as a cutter's. What she leaves off her mainsail and topsail she puts on in her mizzen. Now a very small reduction of the jib and slight increase of fore-foot will keep the balance of center of effort and center of lateral resistance right, so as to permit the reduction of the mizzen and its spars to 'sweet-by' size, is such a rig—which is practically a snug cutter—to receive both a yawl's allowance and also allowance for smallness of area? From a seaman's point of view, I have always had an aversion to the 'yawl' rig, and naturally dread giving a bad rig benefits which may tend to foster its being, and cause it to increase and multiply. But the sailing at a certain tonnage, and under the existing racing rules, the yawl rig, if not a necessary evil, is, at any rate a successful evil; a 30 or 40-ton cutter's main boom is not a pleasant size of stick to play with, and at say 25 tons of modern construction—well, the sooner she's turned into a schooner or yawl (for racing) the better for life, limb and peace of mind, and probably for success. But the same information is the small yawl, why she should be pandered to, and encouraged by a time allowance for 'inferiority' of rig. I can't imagine; it is said that it's a snigger rig, but what has that to do with racing? It cannot be said of her, that as a cutter her boom would be dangerously large and unmanageable. If, however, it is acknowledged to be an inferior rig, why should it be pandered to by racing?"

"The really snug and useful rig for cruising is the 'ketch,' a thoroughly seaman-like rig. Why should not a ketch boat have an allowance, intermediate between a yawl and a schooner's allowance, or even a schooner's allowance?"

"If 'inferior' rigs are to be patronized by a time allowance for 'inferiority,' in the classes of 30 tons and under, then certainly create the 'ketch' class with a suitable allowance, and in a short time, no seaman would be found owning a yawl."

"But the important question now is—if racers are to be rated, for time allowance, by sail area  $\times$  length, must not the minimum area of mizzen, compared to an area of mainsail, be a yardstick for the sail to mainsail in a schooner, be clearly defined? If not, 'sail area coupled with rig allowance' will soon produce, at all tonnages, especially in the small classes, 'schooners' with a dandy rig and a small plan, but with a small 'sweet-by' foremast and foresail; and 'yaws' carrying the smallest apologies for mizzen."

"In my opinion the yawl's mizzen should not be less than a quarter of her mainsail area; the 'ketch's' dandy not less than one-third of her mainsail; and the schooner's foresail not less than half her mainsail."

"Yaws, ketches and schooners of under 30 tons' measurement, should receive the 'rig allowance' only when competing in 'cruising' or 'ocean' matches; of course, 'inland' races for 30 tons and upward must be tolerated, though the arbitrary allowance between rigs creates no true test of relative speed in different states of wind and sea. Class racing should be by all means 'done by the yard'—'fancy' allowances for supposed inferiorities, the prizes should go to 'perfection,' not to 'imperfection.'"

"The proposed rating by sail area, multiplied by length on the load line, will not be far off being a 'rating by stability'; it is as simple a rule as could well be put forward, and, at any rate, is well worth trial; curves of stability and data as to netting and construction of the racing yachts and 'fast cruisers' would produce more accurate results, and perhaps satisfy theorists; but for practical and quick working at regattas, the simple sail and length rule is the best."

"It must, however, be borne in mind that this 'rating' rule is only put forward for the purposes of time allowance at present, and the suggestion is accompanied by a recommendation to continue the rating by tonnage rule. If the rule is freely utilized during this season, ample data will be at hand to guide in the consideration of its future status—whether as a time allowance indicator only, or as the rule of classification or power gauge."

"There is no other article so valuable for popular use in cases of lame back, local rheumatism, lumbago, neuralgia, congestion of the bronchial tubes, coughs, affections of the lungs, and torpid liver as BENSON'S CAPSIC PLEURAL PLASTERS." So writes H. H. Kane, M.D., Physician-in-Chief of the De Quency Home, New York. Prompt, powerful, clean. Price 25 cents.—*Adv.*

#### ANSWERS TO CORRESPONDENTS.—(Continued.)

F. LAKE, Minn.—Can you give me a few hints for catching salmon said to have been planted in Minnesota lakes? Should I fish deep and in what month? Ans. If the fish are there they should rise to the fly in June or July, or you might try trolling for them in deep water if the waters about the shores are warm.

M. L., New York.—I. Can you tell me of a good place to go fresh water fishing, within 25 or 30 miles of New York City? 2. What kind of fish will there be at the Fishing Banks in May, and what is the best time of year to go there? Ans. Go to Long Island straits. Perch can be taken in Croton Lake. After June 1 you can take black bass in Greenwood Lake. 2. Porgies will be on the Banks in May, but not as plentiful as a month later. The fishing is usually good there all the summer.

A. J., New York.—Will you kindly let me know if it is impossible to drown a fish when it is in the water on a line? Ans. If a fish is towed behind a boat, after it is tired and cannot keep its mouth open, I think that it would be drowned. Ordinarily a fish is reeled in exhausted, but not drowned. We think it possible to drown a fish under the conditions named, because the breathing apparatus is so weak that on the action of the gill covers, which open and close with the mouth.

GUY FLINTS, Norwich, Conn.—"J. A. S." asks for gun flints. I have a flint-lock gun that was carried in the war of 1812 that is in good order yet. A few years ago the gun and a handful of flints came into my possession. If "J. A. S." will send me his address and a stamp to prepay postage, I will send him a couple. I tried the old gun on woodcock once, but found it rather slow for snip-shooting, but I did manage to kill one, the bird going straight from me.

J. R. TRACY.

C. R. W., Halesy, Idaho.—Suppose two gun barrels are identical in respect to material, gauge, and style of bore; with the exception that one barrel is 30 inches long and the other 32. Will the 32-inch barrel shoot better, or throw shot a greater distance? Ans. The 32-inch barrel, like charges to be used in both. Ans. Practically there may be difference; for actual service in the field one gun will do just as well as the other, the 32-inch barrel will have a slight advantage over the shorter one. A charge suited to the shorter barrel will also practically do for the larger one.

AMERICAN Kennel Register.

A MONTHLY RECORD.

Its leading feature is the "Pedigree Register" of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of the annual volume, thus making it a complete work of reference. The pedigree registration fee is twenty-five cents, payable in advance.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs for sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include field trials.

Space will be devoted to all matters of importance to breeders and those interested in dogs, the object being to render the American Kennel Register a complete record of the topics of the day.

The Register will be published on the fifth day of each month. All matter intended for publication must be in the hands of its editor by the first day of the month. Entry blanks will be sent on receipt of stamped and addressed envelope.

The American Kennel Register will be sold by subscription only. The subscription price is one dollar per year.

Address American Kennel Register, P. O. Box 2,822, New York City. Make drafts and money orders payable to the Forest and Stream Publishing Company.

The St. Lawrence Gang.

(Pat. England and United States, 1881.)

TRADE MARK

MASKINONGE, PICKEREL, BLACK BASS, Size No. 1-0, Size No. 4-0, Size No. 1-0

This cut shows No. 1-0 (or Black Bass size) with living Minnow attached.

All having patent treble hook with baiting needle, adjustable lip hook and treble swivel, and best silk metal wound gimp.

This is the most ingenious invention and radical improvement in trolling tackle yet made. Its manifest superiority to all gangs now in use is evident to every expert angler. A few of its peculiar excellences are:—It is the only gang on which a bait can live. It is the only gang which can be adjusted to any sized minnow instantly and perfectly. It is not only the simplest but also the strongest gang made. It does not scare away the big and wary fish by a long array of treble hooks. The treble swivel insures perfect revolution of bait and reduces to the lowest possible point the liability of kinking the line.

Orders received from anglers residing in cities in which the dealers keep a full line of our goods in stock will not be filled at any price.

Harrison's Celebrated Fish Hook.

Registered.

Trade MARK.

Whereas, It having come to our notice that some unprincipled house, to gain their own unworthy ends, and to attempt to damage our good name, having spread reports to the effect that the manufacturers of the above hooks are defunct, we now take this opportunity of informing the American and British public that such reports are utterly false. The same efficient staff of workpeople is employed as heretofore, and we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours, which are to be obtained from the most respectable wholesale houses in the trade.

Signed, H. HARRISON, BARTLETT & CO., Sole manufacturers of Harrison's Celebrated Fish Hooks, Re-Mitchell, England. (December, 1882.)

Manufacturers also of Fishing Tackle of every description. Sewing and Sewing Machine Needles.

KYNOCH'S Patent "Perfect" Brass Shells.

MANUFACTURED BY KYNOCH & CO., Birmingham, Eng.

HERMANN BOKER & CO., SOLE AMERICAN AGENTS, 101 & 103 Duane Street, New York.

WILLIAM READ & SONS, Boston, Mass., Agents for New England States.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be re-loaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and closer and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectively crimped with tool (as represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. {  
SIX MONTHS, \$2.

NEW YORK, MAY 10, 1883.

{ VOL. XX.—No. 15.  
Nos. 29 & 40 PARK ROW, NEW YORK.

## CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

## SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annua subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

## ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications, Forest and Stream Publishing Co. New York City.

Nos. 29 and 40 PARK ROW.

## SELECTING THE TEAM.

ON Monday morning next, at Creedmoor, will open the series of four competitions which are to determine who shall make up the American team of 1883. The general preliminary conditions of those test shoots are already well known through the notices which have been sent out calling upon riflemen to compete. The committee in charge have fixed an admirable working plan for each day's work, and every precaution has been taken that the shoots shall be scrupulously fair to each contestant. On each day the six ranges will be fired over, seven shots per man at each. There may be practice up to 10 o'clock, but none from that time until the opening of the competition at half-past 10. Then the men will be called to the firing place by lot, two at a time, and fire through their seven rounds alternately. No one except the scorer will be permitted within twenty-five feet of the firing point, and it will thus be a test of individual merit of the most exacting sort. Fair weather is to be hoped for, and then with these scores before them there ought to be no difficulty in determining who are the most available men to put into the team ranks.

It is imperative that no time be lost in having a captain selected to head the team, so that practice on a sensible working basis may be at once proceeded with. Time is short, and while the shooting thus far this season has been most encouraging, yet it is idle to suppose that victory at Wimbledon will be ours unless to that individual ability be added the strength which comes from a united front against the dangers of tricky winds and shifting lights. Luckily, there is to be no experimenting on ammunition by each man for himself; that senseless proceeding has been cut off and uniformity on this very important point was assured from the very start. The Americans have been granted a very important concession from the original conditions in the use

of the windgauge, and the absurdity of having a match fully a decade behind the times will not be repeated as in 1882. British conservatism has been broken down to this extent, and it now remains to be seen whether or not our team can secure a winning score. If defeat comes, then it is difficult to see where another match is to come from. With the return of a victorious American team there ought to be no trouble in keeping up a series of international shoots.

The forlorn hope of a victory which many of those who watch rifle practice here indulged in last year has changed to a very fair prospect of a successful trip this year. With shooting appliances greatly improved, the men have shown a steadiness which augurs very well for an excellent result. It is now merely a question of individual merit and a long, strong pull together. The rifle will do everything which can reasonably be expected. It is not one whit behind the English weapon, so that the question now is whether the twenty odd years of persistent drill and practice before the butts which each member of the British team will have enjoyed can be overcome by the pluck, intelligence and hard work of the American. With a good team system put into play we feel safe in looking for an American victory.

## THE RIGHT MEN FOR THE PLACE.

THE interesting relation of his Arctic adventures narrated in FOREST AND STREAM by Lieut. Fred'k Schwatka, teaches more than one lesson. One of the most important of these is in strong confirmation of the views set forth by our correspondent, Mr. J. C. Hughes, in our issue of June 29, 1882. In this communication the author called attention to the folly of placing the attempts to reach the high northern latitudes wholly in the hands of men who by education are unfitted for a struggle against adverse circumstances on land. He says:

In connection with Arctic expeditions that have from time to time been undertaken by various countries, one especial feature has always presented itself to my mind. It has always appeared to me that the expeditions have not been composed of the right kind or stamp of men, and I have always, when reading the journals of any expedition that has fallen under my notice, been strongly impressed with the belief that, had the members of the expeditions referred to been composed of a different class of individuals, much better results would have been obtained, and much suffering and, in many cases, loss of valuable life avoided. My idea is that each Arctic expedition should include a certain proportion of a class of men commonly known as North American trappers, who for a trip of this nature possess certain qualities eminently fitting them to assist in undertakings of this kind.

Were seamen not among the bravest of the brave, they would naturally shrink from undertaking a voyage that at any time is liable to be changed to a land or ice march, when all their nautical lore and experience does not tell for much, and perhaps be thrown upon a land trip in an inhospitable country where to save their lives might be a matter that would tax the abilities and best efforts of even the very natives of the country, who, notwithstanding a life of study of the various contrivances possible to be accomplished, have often sufficient to do to eke out a scanty subsistence during the long and dreary winters of northern latitudes.

Reverse the position and place men of the type of Kit Carson, Daniel Boone, Joe Meek and other prominent trappers, at sea in a vessel of the best class, equipped and fitted with all the appliances that science could suggest and money procure; leave them to their own devices, and what would they make of the situation? Go still further, place them at a moment's warning in mid ocean in a ship's boat with scanty supply of provisions, insufficient supply of water, and what would they accomplish, or be expected to accomplish under such circumstances? And yet the hardy and intrepid navigator cast upon the ice is placed in almost as bad a situation in many ways as the landsmen would be in the former mentioned case.

One very noticeable circumstance is apparent to readers of the various narratives of all former expeditions, and this is, that to such men as Eschberg or Esquimaux Joe, who accompanied Capt. C. F. Hall, were due the salvation of the party, who, unaided by their efforts, would have surely perished by starvation, while Hans and Petersen, in the voyages of Kane and Hayes, showed no less prominence in their admirable fitness as members of a northern expedition. Indeed the annals of all the different exploring voyages team with abundant evidences of the necessity of incorporating men of different classes in parties of the kind alluded to.

While reading Strain's narrative of the trip across the Isthmus of Darien, which terminated so disastrously to several of the party, I could not help being struck with the disadvantages he labored under for want of practical men as a component part of the command, for, while they were traversing a country having considerable game, the rivers of which affording a generous supply of fish, although provided with arms and ammunition, they were unable to secure enough food for their maintenance, and while possessing personal bravery, indomitable courage, ability to encounter and endure great hardships, a large portion of the command died from hunger, after the loss of their single and only fish hook. Had such men as I have mentioned been attached to the party, how long would it have taken them to make other fish hooks out of their guns or gun carriages, bones, etc.? The knowledge that a piece of wood or bone, pointed at both ends, tied by the middle to a line, and when baited, laid alongside or parallel

to the line, but when swallowed by a fish and a sharp twitch given would become a toggle fastened in the fish's gullet or maw, and consequently with gross feeding fish, such as catfish and others inhabiting tropical waters, becomes one of the most efficient fish hooks to be had, might have been the means of saving the entire party. Spears, catfish, nets, traps and other appliances would have been within the scope of such men, who would have needed nothing but the wood that grew on the banks of the streams and an ordinary knife to fashion them into appliances for the capture of fish and game. Many of the animals of North America being nocturnal in their habits, seldom offer an opportunity to mankind to secure food by shooting them, but traps, when set by experienced trappers, meet the difficulty and supply food and clothing obtained by no other means.

Nobody ever makes a trip, takes a hunt with, or remains in the company of an experienced hunter and trapper, without learning new wrinkles and contrivances. Books do not treat of forest lore as they do of other sciences. The only place to obtain education in this branch is the school of experience, and the study is of such magnitude that it is never completed. Necessity being the mother of invention, perhaps there is no other class of men who are so often placed in positions requiring success ability to adapt themselves to circumstances; hence the value of their services in all matters requiring prompt measures, decision, and capacity to make the best of the situation. How important it is, therefore, that the very best material should be selected for all such hazardous undertakings as Arctic explorations.

How many men of even average intelligence can procure fire without matches? and when procured, does it strike one man out of a thousand, when needing fire for warmth at night (clothing being insufficient), that the proper plan is to build two or more fires, and lie down between them and thus almost do away with the necessity for blankets at all? No, it does not; but he builds one big fire that he can't get near, if fuel be plenty, and the unfortunate person presents the unhappy condition of being nearly roasted on one side, while being nearly frozen on the other, and after various feats of ground and lofty tumbling, morning returns to find him more tired than when lying down the night previous. Many other examples of the devices, contrivances and shifts appertaining to a knowledge of forest life might be introduced here as illustrative of the correctness of the theory involved in this article, but those mentioned will perhaps suffice.

There are representative men of the class spoken of who will leave the settlements, make a trip through an uninhabited region (occupying months in duration) alone, and live well and be clad warmly, no matter how rigorous the season or inclement the weather, where to a party provided with a much better outfit such a journey would simply mean death by starvation, unless some of the party were skilled in the mysteries of woodcraft. The one would live, so to speak, upon the fat of the land; the others would scarcely see a bird or beast on the trip.

It is enough in all reason to send out men who are willing not only to brave the dangers of the seas with which they are acquainted, without endangering their valuable lives in a land or ice march of which they must, from the condition of their past lives, know little or nothing.

It may be said that the natives of the country are the best persons to be had in the capacity of guides, hunters and auxiliaries. This is decidedly wrong, the argument being good to a limited degree only. The white race the world over is superior as a class to any other; they are better skilled in the use of firearms, means of travel, endurance, and in many other ways. What a white trapper would learn in a few days in Greenland would enable him to discount the average native in anything except perhaps the management of a kayak or something of like nature. Then there is a moral courage that is associated with education and intelligence, that frequently is of the utmost importance, which in matters requiring decision of character and judgment, more than makes up for a large amount of physical courage, since superstition, going hand in hand with ignorance, renders the uneducated native of very little account in many affairs.

The heroism of seamen is too well understood to need any praise, but from the very conditions of their education and training, it is apparent at once that they are at a great disadvantage when forced to face on land a condition of things which might appal even the natives themselves. They are not accustomed, as are the trapper and mountain men of the West, to depend for their comfort, and even life, on the country and its indigenous animals. They know nothing of the game and fish, nor of its habits, and so may starve in the midst of plenty. That landsmen, and especially those brought up in the rough school of the mountain and forest, would add inconceivable strength to any Arctic expedition is very clear.

If I remember the story of the hardships and dangers undergone by the early explorers of America, we see an analogous condition of things; the early Spanish and French explorers in Florida and the South, though passing through a country swarming with game and abounding with fruits and vegetables, often starved to death, or only relieved their wants by robbing the Indians of their maize.

How different is the case in the last Franklin search expedition. Lieut. Schwatka and his men lived on the country, adapted themselves to the customs of the natives, took lessons from them in hunting, house building, dog driving and a dozen other subjects, and really underwent little or no suffering. This shows very clearly what can be done by men thrown on their own resources, who take advantage of every circumstance, even in the frightful climate of the extremest north.

The article from which we have quoted has been exten-

sively copied throughout the country, without any credit to the author, however, and upon the text thus furnished a number of sermons of considerable length have been preached. The closing articles of Lieut. Schwatka's series make a reference to it, at this time very appropriate.

Although the U. S. Government has in no way recognized Mr. Schwatka's important services in the Arctic, other nations have been more appreciative. The French Geographical Society has awarded him the triennial gold medal for Arctic exploration. This honor has fallen three times before to Americans, Dr. Kane, Dr. I. I. Hayes and Captain Hall having each received it. It is interesting to note that this medal was awarded to Mr. Schwatka over Professor Nordenskjöld. As has been well said, the only order Schwatka had conferred upon him by a grateful republic was an order to join his regiment.

#### ADIRONDACK SURVEY NOTES.

##### XVII.—YOUNG FROGS.

IN Harrigan's play of "McSorley's Inflation" when the hero of the piece wants the nomination for corner and addresses a meeting of colored men, he says: "When the learned gentleman who spoke last came from Africa—" and when the whole meeting rises to smite him, he exclaims: "Hould on, gentlemen; it is not of the gentleman himself that I'm speaking, but of his pra-historic progenyators." So it is not of the frogs themselves that I propose to write this time, but of their "pra-historic progenyators," the tadpoles.

Whether you call the larval frog a tadpole or a polywog, for the names vary in different places, it is a queer fellow. What round, well-fet punches they have, and what an innocent look beams from their eyes, and how they wiggle off in schools from the warmest water they can find near the shores when you approach. A serious-minded person once asked me: "What is the difference between a tadpole and a polywog?" I answered him that it was a disputed point among naturalists; that one school held that the animal was a tadpole only in its first few days, while it had external gills; another, that it was a polywog for some months, until the legs sprouted and the tail began to shorten, and then it arrived at the tadpole stage, but that the latest authority, the learned Rona Palustris, held that the tadpole was the male and Miss Polly the female. This left him room to ponder on differences and to practice some original investigation.

One day I was down by the outlet of a pond with a landing net collecting small fishes, and among the weeds and other things there were some tadpoles at every haul. They were remarkably fine ones, and in the hope of finding a specimen far advanced toward froghood, I sat down and looked them over. Some boys came down to see what was going on. They were bright little fellows, full of questions about everything around them, and of course they wanted to know about the polywogs. I never could find it in my heart to guy a boy of that kind. Bless them, if their minds would always remain as bright, and their love of nature always cling to them, how happy they would be. So I gathered them all around me to tell them about the tadpoles, when one opened the subject with, "Now, honestly, Mr. M., are these polywogs really and truly young frogs?" "Yes, really and truly; they are young frogs. See! here is one that has its legs already visible under the skin." They could not quite make it out, however, and with a scalpel I removed the skin and showed them a rudimentary limb. That roused their desire to know all about them, and I was led into a lecture on the subject, and had a most attentive class, for the boy is always a naturalist, and only by the withering touch of "business" does he lose his taste for natural history. This is what I told them:

In April the frog lays her eggs in the water. They are surrounded by a jelly-like substance and all hang together, making a bunch often three times as large as the frog that laid them. They float among the weeds, usually near shore, and hatch in a week or ten days. The green scum that you see on the water, and which is called by many "frog spawn" and "frog spittle" is a vegetable growth with which the frog has no connection, except that it grows in the water where he lives. When the eggs hatch the larval frog is shaped much as these tadpoles are, but the gills are outside of the neck; they are afterward inclosed by the outer skin which closes around them, leaving this little opening for the water to pass out. The change from a caterpillar to a butterfly is not more wonderful than the change from a tadpole to a frog. The whole structure is changed. A frog is a lung-breathing animal that was formerly classed with the reptiles, but is now, with the tritons, salamanders, toads, etc., in the class Batrachia. These are all cold-blooded vertebrates whose nearest relatives are the fishes, and whose young are all tadpoles. Now there is no definition of a fish which can exclude a tadpole, and we only deny that it is a fish because we know that it comes from a batrachian egg and will in time change to that higher class. It has a fin, as you see, all around its tail; it has a skin like some fishes, and now you see where I have laid its head open there are beautiful gills. You may have heard people say "a tadpole grows some legs, his tail drops off, and he is a frog." That is all true except the tail part, this is absorbed, not shed. The tail is of great use to the tadpole, but the frog is a good swimmer without it, and it would be a great waste of material to throw away the tail after grow-

ing it to such a size. The fact is, that the tadpole first sprouts a small pair of hindlegs, then the forelegs appear and the tail begins to shorten. After this, the little sucking mouth which you see in the tadpole, which is formed for sucking the slime from plants and the flesh from dead fishes, begins to change into the broad mouth of the frog, which is better adapted to catching insects. These are the external changes which any careless observer may note, but more wonderful changes are going on inside. The gills are also being absorbed, and a little pair of lungs are growing, and at first the adolescent frog comes up to the surface and takes a mouthful of air just to try his new lungs and strengthen them. In time the gills are gone, and he can breathe the air at any time. The intestines are changed from this great convoluted mass, suited to a vegetable diet, to a shorter arrangement, better fitted to a carnivorous menu. So you see, boys, there is more in the growth of a tadpole than you thought for, and if you will only watch the growth and habits of all living things, you will not only be interested, but will better understand your own life.

The boys showed the greatest interest in the dissection and the explanations and will never forget the lesson. No doubt they will instruct other boys in the beautiful changes that are going on in the larval frog and teach them to see beauty even in a polywog.

I have been tempted to write out this incident because I have found boys of sixty years old who have been fishing all their lives who knew no more of tadpoles than the class I found that July day on the shores of Clear Pond. They had a tradition that a tadpole became a frog, somehow, and they believed, but never absolutely knew it, because they never took the trouble to keep some specimens and note the change. They were content to take the word of others that the change was made, but only had an indefinite idea that to grow legs and lose the tail was all that was requisite. Some of these jolly old boys, I hope, will be glad to know what I told the young boys who were my students for half an hour, and whom I hope to meet again with an increased appetite for knowledge of nature and of the "pra-historic progenyators" of frogs.

### NIMROD IN THE NORTH.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

#### VI.—Dogs and Dog-Sledging—Part One.

I DOUBT very much if there is a domestic animal in the world that is so essential to the welfare of a people as the dog is to the natives of the north, especially those of the American Arctic. It is their horse for drawing vehicles, their mule for packing their effects, their hunting dog for the chase—and by the chase alone do they subsist—and in case of great extremity the bitter morsel by which they avert starvation.

"How large are the Esquimaux dogs?" is a question I have been asked more than a score of times for every Esquimaux dog I have ever seen. I always answer that they are about the size of a rook. There is a general impression among people of the temperate zone that these dogs are a distinct breed, and that a description of any one taken here or there would, with very slight modifications, serve for any. The Esquimaux dogs are about as distinct a breed as the breed of cats at home, although a far more useful animal in every respect. There is a sort of general similarity in their pointed, wolfish ears (if they have not had them broken in wrangles over food, as the great proportion of those that I have seen in North Hudson's Bay seem to have) and in their shaggy coats of warm hair. But, after all, I have seen them when full grown of all sizes, from a small pointer to a small Newfoundland, and with coats as shaggy and beautiful as the latter and again as coarse and straight as the veriest mongrel; while one may have a muzzie like a fox and another a mug like a bulldog, although the latter is rare and a medium between the two very common. A dog painter visiting the Arctic would have to bring every color that he had ever used with all the combined breeds at home, while one who trains these animals would find enough variety of dispositions to exercise the brain of a genius. So different are their sizes that the native dog-driver generally has a harness for each, and he always knows its assignment when the dogs are hitched up in the morning for the day's work, as the collar of one that would pull his ears as it was put on might be almost too large for the shoulders of some little runt that had been dwarfed in his puppyhood by too good or bad treatment.

The big dogs lord it over the smaller ones in a thousand disagreeable ways, although their pugnacious insolence does not always reward them with the best to be had. If in the way of food the morsels be made very small, the active little fellows will be almost sure to get the greater part of it, for the very first reception of food among a number of them is a tussle among the belligerents, in which the conservative reap the harvest. This the native dog-driver knows, and as his partiality is all toward those that do the most work—that is the big fellows—such distributions are not very common. Another source of common annoyance to the little dogs and the masters of both, is when the snow-house is completed, and its long passageway of snow blocks has been built, and the little ones crawl into it for the night's rest, in which they are usually not disturbed by the larger dogs unless a storm comes up and then they are sure to want this protected berth, and walk in to take it on the general principle that "might makes right." A fight of course ensues, for even the small dogs, knowing the inevitable result, feel that they can hardly give up such a warm berth without some show of rights. The result is that the snow block closing the igloo door is generally knocked in, and

the inmates, or some one of them, gets up, stick in hand, and with vigorous blows clears the passage of all dogs, without regard to "age, sex or color." This is repeated at interesting intervals throughout the night if it continue stormy.

FOREST AND STREAM, that the well-trained Esquimaux dog never barks in the presence of game, and in fact, seldom barks at all; but it must not be inferred thereby that they are not a noisy race. Their half-starved condition keeps them in a chronostate of belligerency, growing and fighting over everything that bears even a resemblance to food. During the night, especially those cold, bright, moonlight ones so common in the Arctic winter, they will frequently favor you with a prolonged howl, that makes sleep almost impossible. The native driver, awakened by the fearful din, may attempt to suppress it by sharply shouting *Yuger! Yuger!* at the top of his histenterian voice. This in the small closed igloo sounds not unlike a 15-inch gun in a turret, and one feels like the small boy that would rather have the chills than take the chologogue. They are particularly prone to these midnight revels when tied up, a course which it is necessary to pursue in the early autumn to prevent them scampering after the reindeer that may be grazing nearby, and driving them away. At this time they are muzzled, so that their howling noise may not frighten the game, and unless some very energetic canine liberates himself, the sleepy man may have comparative quiet.

Every time they are harnessed to the sledge, the first crack of the whip to start is a signal for what might be called in frontier parlance "a free fight." The first dog struck makes a belligerent spring for his nearest neighbor, who in turn retaliates on the next, and so on until, like the proverbial row of upright bricks, they are all down in a matted mass of hair, harness, and howls, which the native driver at once proceeds to unravel with the butt end of his whip. Having taken their preliminary "bitters," they are then ready for a serious start and trot along the rest of the day in a manner worthy of Baranov's happy family.

There are in general a most unmerciful nuisance. Two or three heads can always be seen closing the igloo ready to steal anything eatable that may be left unwatched for a moment, and then ensue a noisy wrangling over the capture which generally ends in some big aggressive dog, which, by the way, has not risked getting his head broken at the igloo entrance, walking off with the spoils, unless speedily recaptured by the inmates, which in case of eatables, unless made to get up once or twice during the night, will make quite small igloos, just large enough to hold everybody when properly "spooned," and store all the harness, meat, and so forth, in as small an igloo as possible alongside. When everybody has retired the dogs commence their engineering to get the contents, scratching away as if for dear life, until a punther-like yell from the native driver frightens them away; but he is very lucky indeed if he is not compelled to get up once or twice during the night and repair some damage they have done. This can be forestalled by pouring water on the snow, converting it into ice, but with the careless indifference so characteristic of the Esquimaux, they seldom do this until the dogs have demolished several small store igloos and stolen their edible contents. When one reflects that these animals are only fed every other day even when there is plenty of food for them, and oftentimes only get a few scraps of food, if any, for a day, it is not very full, their voracious ferocity is easily understood.

On King William's Land at one time, the dogs of Henry's party returning from Terror Bay to Gladman Point, were seven days without food, doing hard work all the time; the party itself, meanwhile, being nearly three days without anything to eat. I have known them to eat sole-leather, pistol holsters, canvas gun-covers, all-cloth clothes, birch rope, cloth saturated with grease, and on route to Back's River had them devour a pair of India-rubber overshoes that I was depending upon for summer wear, as if their consciences were not sufficiently elastic without them. We had been fortunate in securing a few reindeer while returning homeward along Back's River, most of which we found well inland from the river, and it was also this fact, added to many other reasons not of a sporting character, that induced two weeks of our five-hundred-mile journey. The supply of reindeer meat, with the rapidly disappearing fish that we had bought of the Esquimaux at the mouth of the river, gave the poor dogs but few scanty meals, which, coupled with the razor-edged weather in the depth of an Arctic winter, told terribly upon them, and before we had left the river we had lost one fine dog, and so drained the vitality out of the rest that we increased the mortality to two weeks of our five-hundred-mile journey. It was pitiable, indeed, to be compelled to notice the silent sufferings of these faithful companions as they slowly fell by the wayside, with a seeming devotion as if this sacrifice was self-imposed to aid as much as possible on our uncomfortable journeyings.

Ravenous as they are, tearing everything to pieces not actually wood or iron, or raiding fearlessly into the igloos in quest of food, they are faithful protectors of their human companions, not even once attempting to harm the little children who wander innocently among them, pelting them with toy whips, when half an hour afterward they would be savagely tearing a dead starved companion, limb from limb, to secure the hide, which was nearly all that was left of him. Every time one of the party entered the igloo they wedged themselves in along with him, so tightly that it was almost impossible to move, hoping the fierce steel snow stroy more or less, and when outside every motion made was intently watched, and if it bore a resemblance to giving them anything eatable, they would make a rush that would pile the pack around you in a most alarming-looking but harmless way, until something else drew their attention in another direction. These facts have sometimes led persons to believe that "assault with intent to do bodily harm" were the motives actuating the fierce steel snow stroy more or less, and when outside every motion made was intently watched, and if it bore a resemblance to giving them anything eatable, they would make a rush that would pile the pack around you in a most alarming-looking but harmless way, until something else drew their attention in another direction. appendage or arm hanging down into the water, which, from his acquaintance with the squid, he concluded to be that of the squid, being probably the only one left after the rest had perished or been devoured.

Such was likewise the opinion of a navigator of much experience and long observation in the scenery of the North Atlantic then on board, who remarked that the corrupting lump was intolerably fetid and offensive to man, and would, if the luge was suffered to run against it, impregnate her with the foulness and stench for the whole voyage. She was accordingly kept to the windward for the purpose of avoiding it, but the smell was, notwithstanding, extremely nauseous and disgusting.

On conversing with mariners in the White Sea, such occurrences were spoken of by them as too common to excite much attention or any doubt.

Afterward, while at Drontheim, in Norway, Capt. N. discoursed with practical men concerning things of this kind. The prevailing idea was that such drifting lumps were by no means uncommon; that they were bodies or fragments of huge squids; that these were sometimes borne away by the Madroster current, and engulfed and dashed to pieces by its whirlpools, and thus these broken trunks and limbs sometimes cast on shore and sometimes tossed about on the sea.

It is supposed that squids and whales inhabit the same tracks of ocean, because the former furnishes food for the latter, at least for the caracalots, orca, and other toothed and voracious species.

## SPRING BIRDS OF NEBRASKA.

BY A. HALL.

32. Common Crow—*Corvus frugilegus* Bartr.—This species is a very shy bird in Ohio, but here it is quite tame, and takes but little notice of man. They are often seen following the plow like blackbirds.

33. American Magpie—*Picus varius ludovicianus* (Cah.) Ridg.—An irregular visitor. I am told that they were quite common years ago, but now they are rarely seen in this vicinity.

34. Blue Jay—*Cyanocitta cristata* (L.) Strickl.—This species is rare in this vicinity, but once seen, April 30.

35. Kingbird—*Tyrannus carolinensis* Bd.—Common; breeds. Arrives.

36. Arkansas Flycatcher—*Tyrannus verticalis* Say.—Saw this species in open prairie, perched upon weeds, watching for their insect prey. Habits like the preceding, but not so common.

37. Say's Pewee—*Sayornis sayi* Bd.—Saw this species only on wooded streams. It was very shy and I was able to procure but one specimen.

38. Night Hawk—*Chordeiles papilio hergei* Cass.—The night hawk is exceedingly abundant here. I have counted upward of fifty at one time as they were darting about in the air catching insects. When perching, this species sits lengthwise of a limb, generally roosting upon a tree, while the whip-poor-will roosts upon a log or the ground. These two species are often confounded, but are distinguishable by the conspicuous white wing bars of the night hawk. This variety, *hergei*, is lighter and grayer on the back than its eastern representative, but there are no other marked differences. It nests in the ground, and lays but two eggs.

39. Belted Kingfisher—*Ceryle alcyon* (L.) Boie.—Common, breeding upon suitable streams of the West. Nests in a hole in bank, excavated by the bird. Eggs pure white.

40. Hair Woodpecker—*Picus rufinus* L.—A regular migrant, but not abundant. Specimens taken.

41. Red-headed Woodpecker—*Melanerpes erythrocephalus* (L.) Sw.—Not uncommon in spring. I saw no woodpeckers in this vicinity until April.

42. Golden-winged Woodpecker—*Colaptes auratus* (L.) Sw.—Abundant. Breeds.

43. Hybrid Woodpecker—*Colaptes hybridus* Baird.—Abundant in company with preceding. Examined several specimens. The one now before me has red maxillary patch (black feathers hardly noticeable), wings and tail underneath, yellow orange, shafts reddish. I may be wrong in placing this as a distinct species. Would like to hear from some one upon the subject.

44. Red-headed Woodpecker—*Colaptes auratus* Sw.—This species is rather rare here, but I succeeded in taking an undoubted specimen of this species.

45. Great Horned Owl—*Bubo virginianus* Gm.—One specimen taken. I think its occurrence here accidental, as there is no heavy timber suitable for breeding.

46. Short-eared Owl—*Isio asperipennis* Pall.—Resident and abundant. Breeds in May. Nest in hole of willow stub, fifteen feet from the ground, in which about two feet from the top, upon decayed wood, two white eggs were deposited. This species generally nests upon the ground in burrows.

47. Burrowing Owl—*Speotyto cunicularia hypogaea* Cs.—This species is exceedingly abundant, breeding in the burrows of the prairie dogs. On approaching one of these dog towns, you will see these little owls perched upon one of the innumerable little eminences that mark a village, standing erect upon their long legs, bowing and nodding until their breasts almost touch the ground. They are quite tame at first, and are then easily secured, but after a few shots, they become very shy and fly up out of range. I never saw them take to the holes unless wounded. I dug into several of these holes for eggs, but failed to obtain any; I succeeded in finding one, however, within a foot of the entrance of a hole. It was pure white and fresh. This was last week in May.

48. Marsh Hawk—*Circus cyaneus hudsonius* (L.) Cs.—On the great plains of the West I saw this species in great abundance; skimming about in all directions in quest of food and small birds upon which they subsist. The nest is placed upon the ground and is composed of dry weeds and grass only. The eggs are five in number, of a dull white color, with light bluish tint. Upon approaching a nest of this species the old bird flew off and crept about just above my head, uttering in rapid succession the notes *too, too, too*, and as soon as I had retired a few rods, she at once returned to her eggs. I did not remove them for several days, but visited them daily, and at each approach the same performance would be gone through with. Occasionally the female would fly off and bring her better half to the rescue, but he being a great coward kept at a respectable distance.

49. Swallow-tail Kite—*Elaenoides forficatus* Cs.—A regular visitor. While walking along Wood River one very windy day, I saw a fine specimen of this beautiful species dart into the brush and light upon a small tree, and as he sat there struggling with the wind, I easily crept to within

easy range and added another rare bird to my list. This is the only one I saw.

50. Louie Falcon—*Falco naevius* Licht.—This species is apparently not very abundant in this locality. I saw but two, and they were following up the streams. It was impossible for me to shoot one or even to get a shot. The pair I saw flew directly over my head, but before I could raise my gun they were out of range.

51. Richardson's Hawk—*Falco richardsoni* Ridg.—Not uncommon. Plumage lighter on back than its Eastern ally; no other marked difference; size about same.

52. Sparrow Hawk—*Falco sparverius* L.—Abundant. Breeds. The Ohio hawk which offers a bounty on all hawks, ought to be heeded so as not to include this beautiful and useful species. The sparrow hawk kills great numbers of mice and noxious insects, and therefore should be protected instead of being killed.

53. Saw-whet—*Ninox scintillans* Bp.—This species is very abundant. During migration, almost every tree contained one. They were quite tame, and easily approached. They do not tarry long before leaving for their breeding places in Northern Dakota and Northwest.

54. Rough-legged Hawk—*Archibuteo lagopus sancti johannis* (Gm.) Ridg.—This species is very abundant in winter, and subsists entirely upon mice, frogs and small rodents. It seldom if ever preys upon birds.

55. Porcupine Quill Hawk—*Archibuteo ferrugineus* (Licht.). Its occurrence here is accidental. One was taken near Grand Island, Neb., in winter of 1881.

56. Fish Hawk, Osprey—*Pandion haliaetus* Sav.—Not uncommon on Platte River.

57. Golden Eagle—*Aquila chrysaetos* Cuv.—An irregular visitor. I received a fine specimen of this species in the flesh, shot January, 1881, from my friend F. W. Powell.

58. Turkey Buzzard—*Cathartes aura* L.—Common. Arrives from the South early in April, and probably breeds.

59. Carolina Dove—*Zenaidura macroura* Bp.—Abundant, nesting upon the ground, on the banks of wooded streams. Found none nesting in trees.

60. Sharp-tail Grouse—*Phasianus phasianellus columbianus* Cs.—This species is no longer a resident of Northeastern Nebraska, where it once used to breed. A few winter in company with the prairie hen, breeding in North Nebraska and Dakota.

61. Pinnated Grouse—*Capidonia capido* Bd.—Abundant, and becoming more so every year, notwithstanding the destruction of thousands of eggs every year by prairie fires. I found several nests of eggs destroyed in this way.

62. Virginia Partridge—*Ortyx virginiana* Bp.—The quail, or Bob White, is quite abundant, but is confined mostly to thick wooded streams. I have, however, seen them far out upon the open prairies. They are seldom shot by the residents who say that they are too small to kill.

63. Killdeer Plover—*Epipeltis caerulea* Cass.—I was very much disappointed in not seeing more plovers. I had expected to get several species, and this is the only one of the family I saw. The killdeer arrives the last week in March, and breeds in May.

64. Avocet—*Recurvirostra americana* Gm.—My friend F. W. Powell shot a fine specimen of this species upon the Platte River, the first of the spring.

65. Wilson's Phalarope—*Scopelogadus wilsoni* Cs.—Apparently not very common. I took two specimens, male and female, which were the only ones I saw. They probably breed upon the Platte.

66. Wilson's Snipe, English Snipe—*Gallinago wilsoni* Bp.—Apparently rare in spring; but one specimen was seen on the Platte River.

67. Semipalmated Sandpiper—*Ereunetes pusillus occidentalis* Cs.—A very common migrant. I have examined several of this so-called Western semipalmated sandpipers, and I think it identical with *E. pusillus* of the East. Would like to hear from others upon this subject.

68. Least Sandpiper—*Aerotramas minutilla* Cs.—Common on Loup River, feeding upon the mud bars. When standing perfectly still upon these bars they would run around me like chickens.

69. Baird's Sandpiper—*Aerotramas bairdi* Cs.—This species arrives from the south in small flocks in April, and is the most abundant of the family.

70. Great Marbled Godwit—*Limosa fedra* Ord.—A common migrant, frequenting the sand bars of the Platte.

71. Greater Tattler—*Totanus melanoleucus* Gm.—A regular migrant; common. This species is easily identified by its long, yellow legs—hence the name. From the throat of one I took a fish three inches long.

72. Lesser Tattler—*Totanus flavipes* Gm.—Regular migrant. Common.

73. Bartramian Tattler—*Bartramia longicauda* Cs.—Commonly known as upland plover. Arrives last week in April. Breeds in May. They are very tame and are often killed by the herders with their long whips.

74. Long-billed Curlew—*Numenius longirostris* Wils.—Common on the Platte, and also upon dry places, where it feeds upon various insects. It utters a prolonged whistle that can be heard a great distance. Breeds on the Platte in June.

75. Eskimo Curlew—*Numenius borealis* L.—This species arrives upon the wheat fields in April in small flocks and is then very shy. I succeeded, however, in shooting five by getting a horse between myself and the flock and urging him sideways until within easy range.

76. Great Blue Heron—*Ardea herodias* L.—A common migrant, seen on wooded streams only.

77. Zetteren, Sandpiper—*Batrachus mugilans* Cs.—Common. Breeds in May.

78. Whooping Crane—*Grus americana* (L.) Temm.—A common migrant. While camping upon the Platte River, I had a good opportunity to watch these beautiful birds as they came in from the prairies every evening. Usually fifteen or twenty were seen together, flying close to the water's edge in single file. They would alight upon a sand bar at a distance of perhaps fifty rods from me, carefully folding their beautiful wings and strutting proudly about. This species is very shy, and impossible to take with an ordinary shotgun. I offered a bounty of five dollars apiece, but failed to secure a single specimen. The white crane arrives about the middle of March, and none are seen here after April 20.

79. Sandhill Crane—*Grus canadensis* (L.) Temm.—This species is as large as a turkey, and is especially as good eating. They seem to delight in mounting high in the air, and soaring in a manner as the turkey buzzard, uttering, as they go, a coarse, rolling, rattling note, somewhat like that of the tame pigeon, but very much louder. They breed upon the Platte in June.

100. Carolina Rail—*Porzana carolina* (L.) V.—A very rare

migrant. I saw but one specimen on the Platte. My friend, F. W. Powell, a very close observer of birds, tells me that he never saw it before.

101. Coot, Mud Hen—*Fulica americana* Gm.—Common. Breeds upon small lakes near Loup River.

102. White-fronted Goose—*Anser albifrons* Gm.—A rare migrant. One specimen was taken upon the Platte by F. W. Powell in spring of 1881.

103. Snow Goose—*Chen hyperborea* Boie.—Locally called brant. It is the most abundant of all the geese I saw upon the Platte, and the most difficult to shoot, as they fly very high and seldom come within range. As they sit upon the sand bars they look, in the distance, like huge snow banks. They leave the Platte for their northern breeding places the last week of April.

104. Canada Goose—*Bernicia canadensis* Boie.—Regular migrant, but not so common as the following. Locally called "Mississippi goose."

105. Huthins Goose—*Bernicia canadensis hutchinsii* Cs.—Same as preceding, but smaller. Hunters who make a business of shooting geese for their feathers tell me that one man has been known to kill forty in a single day with a shoulder gun. I saw hundreds of them sitting upon the ice early in March. All geese leave the Platte by the last week of April. I do not regard a spring goose as fit to eat. They are clean and taste very fishy.

106. Mallard Duck—*Anas boschas* L.—Regular migrant. A few remain to breed.

107. American Widgeon—*Mareca americana* Gm.—A regular migrant, but not common.

108. Green-wing Teal—*Querquedula carolinensis* Steph.—A common migrant, frequenting the small streams. Are considered worthless as food, being too small.

109. Blue-wing Teal—*Querquedula discolor* Steph.—A regular migrant, but not so common as the preceding.

110. Shoveler Duck—*Spatula clypeata* Boie. Saw them in company with teal. Not common.

111. Merganser—*Mergus merganser* L.—A common migrant.

112. Hooded Merganser—*Mergus ecaudatus* L.—Occasionally seen in winter, but rather rare. Mr. T. W. Powell shot a pair in the winter of 1881.

113. White Pelican—*Pelecanus erythrorhynchos* Lath.—Occasionally seen on the Platte River.

114. Herring Gull—*Larus argentatus* Bu.—A common migrant.

115. Franklin's Rosy Gull—*Chroicocephalus franklini* Rich.—Rather rare. Saw a small flock of five flying up the Platte River, which were the only ones I saw.

## THE MAINE TAXIDERMIST LAW.

Editor Forest and Stream:

The Maine Legislature of 1883 has repealed "all acts and parts of acts authorizing the appointment of taxidermists," and also Section 17 of Chap. 59 Pub. Laws of 1878. Chap. 59 relates to "game and birds," and Sect. 17 reads as follows: "The provisions of this act shall not apply to taxidermists commissioned by the Governor with the advice of the council, to take and kill birds for scientific purposes, provided they kill the birds for such purposes only."

No law has been enacted as a substitute whereby the cause of science may be legally advanced, and so far as I can learn, the only argument in favor of the repeal of this law was that it had been violated and its privileges abused. Such an argument can be applied to some of our most wise and beneficent laws, and the policy of total prohibition of reasonable privileges not only fails in practice to remedy abuse, but really aggravates and increases evils arising therefrom. Yet the obstreperous advocates of such a policy are seldom convinced, even with constantly repeated examples before them, of the fallacy of their theories. Upon such a reasoning one might advocate a perpetual close time for game, because the privileges allowed by existing laws have been, and always will be to some extent, abused; and, indeed, the constant efforts for the enactment of more rigid laws, so often urged by these advocates, for little or no practical knowledge and experience, tend toward extreme prohibition and the final abolishment of field sports or the alternative revulsion of the popular sentiment in favor of legal restrictions. In regard to this taxidermist law I may claim to have some practical knowledge, both as regards its bearing on the cause of science and the effect of the law in practice.

In the Fish and Game Commissioners' report for the year 1880 I initiated a list of fish and game law violations prosecuted during six months of that year. In that list was the following item:

"Killing song birds in June, 1880. Fines and costs paid." In this case an example was made of a taxidermist who was shooting birds during the breeding season for the sole object of selling their skins for millinery purposes. And such abuses are much more easily detected and punished by the taxidermist than by the sportsman. It is an ordinary violation of our fish and game laws. It is not possible that in a few instances there have been taxidermists' licenses issued to persons who neither practice taxidermy nor seek to attain, for themselves or others, any information or a collection of a scientific nature. This matter could easily be guarded, however, by a requirement for all appointments and licenses of taxidermists to be approved by the Commissioners of Fisheries and Game, either upon each application before appointment or upon each license to render it of effect.

Omitting those who might attempt to procure taxidermists' licenses for a fancied shield of game law violations, there are two classes of persons to whom such licenses have been issued heretofore, and by whom such would be sought (if possible to be obtained) in the future. These two classes are the professional taxidermists and the students of ornithology, the two often being combined in one.

The professional taxidermist, who, by his skill, can preserve in natural form and appearance specimens for our natural history societies or game birds for sportsmen, and by his labor add to his needed income for a maintenance, and the ornithological student who must necessarily kill birds to learn by close examination what cannot otherwise be determined. It was my pleasure to personally solicit and obtain the appointment of a non-resident of Maine as a taxidermist, one who has for several years visited certain localities here each year for the purpose of studying the birds to be each found, a gentleman known as one of the leading ornithologists of the United States. Yet this year he must abstain entirely from further pursuit of his scientific investigations of the small land birds in Maine, else render himself liable to the odium and possible penalties of violating our laws. In my catalogue of the "Birds of Maine," a taxidermist, one who has for several years visited certain localities here each year for the purpose of studying the birds to be each found, a gentleman known as one of the leading ornithologists of the United States. Yet this year he must abstain entirely from further pursuit of his scientific investigations of the small land birds in Maine, else render himself liable to the odium and possible penalties of violating our laws. In my catalogue of the "Birds of Maine," a taxidermist, one who has for several years visited certain localities here each year for the purpose of studying the birds to be each found, a gentleman known as one of the leading ornithologists of the United States. Yet this year he must abstain entirely from further pursuit of his scientific investigations of the small land birds in Maine, else render himself liable to the odium and possible penalties of violating our laws. In my catalogue of the "Birds of Maine," a taxidermist, one who has for several years visited certain localities here each year for the purpose of studying the birds to be each found, a gentleman known as one of the leading ornithologists of the United States. In my catalogue of the "Birds of Maine," a taxidermist, one who has for several years visited certain localities here each year for the purpose of studying the birds to be each found, a gentleman known as one of the leading ornithologists of the United States. Yet this year he must abstain entirely from further pursuit of his scientific investigations of the small land birds in Maine, else render himself liable to the odium and possible penalties of violating our laws. In my catalogue of the "Birds of Maine," a taxidermist, one who has for several years visited certain localities here each year for the purpose of studying the birds to be each found, a

birds, and among these correspondents are gentlemen of scientific attainments well known here and elsewhere. Are all these persons to be classed with poachers, absolutely prohibited by law from further observations and study of our birds, or obliged to restrict themselves to "hawks and crows?"

I have been in the habit of obtaining birds for study, often preserving their skins and skeletons, either for my own ornithological collection or for that of the Portland Natural History Society, of which I am a member. As for game, I am not loath to seek it elsewhere than in the State of Maine, but it is with reluctance that I am prohibited the continuance of the study of natural history at home. I am already an involuntary offender against the law, and am likely to be so in the future, by "having in possession" specimens of insectivorous birds.

Birds are sent to me for identification or examination, freshly killed ones as well as skins, from North, East, South and West, often from regions far beyond the limits of Maine or New England; yet now I am liable to arrest and a heavy fine for having in possession any "insectivorous" bird. What shall I do when dissection reveals to me insects in the stomach of a bird in my possession? Even the strikes or "butcher-birds," which attack canary birds if exposed in their cages at windows, and kill many of our small native birds, are insectivorous, and cannot now be killed either for scientific purposes or as a nuisance, except under the liability of heavy legal penalties. The law now stands as follows:

"No person shall kill, or have in his possession, except alive, any of the birds commonly known as larks, robins, swallows, sparrows, or orioles, or other insectivorous birds, crows and hawks excepted, under a penalty of not less than one dollar nor more than five dollars, for each of said birds killed, and the possession by any person of such dead birds shall be *prima facie* evidence that such person killed such birds." (Approved Feb. 26, 1883.)

This enactment and the repeal of the taxidermist law effect a legal prohibition, under severe liabilities, of the practical study of ornithology as applied to the larger part of our small land birds, forbids the capture or possession at any time of such birds, for any purpose whatever, and provides a penalty for shooting some of our game birds, even in the open season provided by our game laws.

Such extreme measures are to be deplored by all who have a practical interest in, or knowledge of, this subject. To the advocates of such prohibitory laws having no practical knowledge, or sympathy with, either field sports or scientific study, probably there will seem no room for regret at these recent enactments. But all better informed persons deplore such extreme and undesirable measures. As a class our farmers are always interested in the protection of little birds, yet they have sufficient intelligence to know that it is only to the scientific observations of such subjects that attention to the study of ornithology that the public generally is informed as to what birds are beneficial to agriculture, and what ones are injurious to crops. And to learn this it is necessary to kill many birds, at all seasons, and by dissections learn just what forms the food of each species in certain districts, what kinds of birds subsist upon noxious insects, what ones subsist upon grain, buds, etc., and many other facts of which a thorough knowledge has not yet been fully developed.

Even the old taxidermist law, imperfect in some respects, may be deemed preferable to the extreme laws recently enacted, if energetically enforced. The enforcement of the old taxidermist law in regard to "scientific purposes only" would alone correct many of the alleged abuses.

To those inclined to commit abuses, if there are any such among our taxidermists, this new law will barely prove even a scare-crow.

Others may hold such extreme laws in open contempt, and the large class of ornithological students, sportsmen and others taking a practical interest in birds, who feel under a moral restraint and strive to respect our laws, will be the ones to suffer by being deprived of favorite pursuits.

Let our birds be protected by practical laws, such as can be enforced. Such laws should be framed with all the liberality consistent with the object in view, and then will be supported by the public, both in sentiment and deeds.

I would suggest to all interested in the subject that active steps be taken toward remedying this matter as it now stands by presenting a bill for enactment at the special session of our Legislature next August. Provision should be made for the appointment of taxidermists as heretofore, and it might be well to provide that all such appointments should be based upon the recommendation of the committee of officers of some natural history society incorporated in this State. A clause prohibiting the taking of moose, caribou, deer, woodcock, grouse, quail, dusky ducks, woodpeckers and Barmian sandpipers, or "upland plover," for any purpose whatever, except during the times allowed by the current game laws of the State, would be a guard against attempts to shoot game under false pretenses. A well-drawn law properly presented to our Legislature by some one thoroughly informed on the subject would probably be readily enacted.

EVERETT SMITH.

PORTLAND, Maine, April 28, 1888.

## HOW SNAKES SWALLOW.

**S**PEAKING of snakes and their elastic throat capacity, it occurs to me that sixty years as naturalist and half a century as taxidermist would not be likely bring several points of interest under an eye not totally blind. By practice a man will get or stand motionless longer than he can at first believe possible, and it is only when this art is acquired that animal life is fully over-reached. They seem to recognize life in a great measure only by motion.

I have had a creature touch my boat with his nose and pass on only a little suspicious. I have had a humming bird land on a branch within a foot of my own nose for half a minute looking me squarely in the eye, and as I did not even wink, return to flowers within an arm's length, with the very proper conclusion, You look like a man but I believe you are only an old stunp.

Snakes approach their victim like the hour hand of a clock. There is no perceptible movement. One little spot of the body moves, while all the rest is fixed. The head moves by an impetus from the tail perhaps, and when striking distance is reached, the muscles are gathered for the final spring. This is made with no regard to what part of the object is reached. If a frog is caught, as is often the case, by a hind leg, that leg goes down first, while the body follows in a bunch. If a snake catches a neighbor by the head, as the water snake, lately referred to, was caught, he goes down head first; if

caught by the middle, as I once knew to be done, he is swallowed double, and in this case the swallower was but six inches longer than the swallowed. The seven red squirrels I took from the body of my black snake followed each other head first, a most positive evidence of fascination, since it is hardly possible that such unbroken succession could be the result of any other process. But the snake is not the only creature that swallows "big things." I once cut from the throat of a hawk the foot, leg, shoulders and shoulder blade entire of a muskrat. I once took from the neck of a weasel a sucker thirteen inches long whose head girth was double that of the duck. I cut from the throat of a heron a chicken as large as a woodcock, and sat almost an hour as "Crownen's quest" before it got through my thick skull what those soft yellow feet and bill belonged to. This capacity for extension is common among birds and reptiles, owing to the flexibility of the posterior connection of jaws, or mandibles, they being held together by muscular contraction, and not by bony joints as in mammals, discussion does not produce dislocation.

B. HORSFORD.

SPRINGFIELD, Mass.

**NOVA SCOTIA SPRING NOTES.**—As I expected, our spring has commenced earlier than usual, and I think it will be generally found that after a steady cold winter like that we have experienced, which is a somewhat rare phenomenon in our province, the succeeding spring will have a fairly even and high temperature, speedily calling into existence both animal and vegetable life. The first harbinger of spring, a snow-bird (*J. hyemalis*), put in an appearance on April 30, and, on the 31st, the first creeper (which I observed was the well-known caterpillar, of *Pyrrhastria isabella*). The temperature, however, hardly rose above 32 degrees until April 3, when, with the thermometer at 38 degrees in the shade, and a warm sun making itself felt in sheltered south aspects, the common housefly and a few other species of *Diptera* began to buzz about. April 4, the first "cuckoo" or "puck" willow (*Salix*) began to open its catkins. April 5, silver sparrow (*M. melodia*) first heard singing. April 6, white-clover (*T. repens*) leaves just opening. April 7, plenty of robins (*T. migratorius*) about. April 10, thermometer at noon 57 degrees; a lovely, warm, summer-like day. First croak of frog heard this season, about 6 P. M., in a neighboring swamp. Last year the first croak at same place was heard April 18, so that the frogs awoke from their winter nap eight days earlier this year than last. There is an unusual occurrence, from close observation for many years, I have found the time of first croaking to vary, as a rule, but a few days either way. In 1878, first heard April 18; in 1880, April 16; in 1881, April 17; in 1882, April 18. In some especially early seasons I have heard them even a few days earlier than this year. In 1885 I registered April 6 as the date, but that is the earliest I have. On April 12 the first purple grackles, called the "swamp robin," (*G. purpurea*) appeared. This was a cold, damp day, with a heavy southerly wind, and thermometer at 58 degrees. In the evening we had a perfect serenade from croaking frogs in the swamp. April 13, first butterfly (*V. atalanta*) of the season seen—one of last year's stock. April 15, a glorious day, with the thermometer standing at 60 degrees in the shade, and 94 degrees exposed in south aspect to the sun—a general awaking of animated nature: woodpeckers hammering, frogs croaking, several *Camembert* (*Camembert*) flies about, while many small hordes of insects, especially small *scarabæi*, filled the air. At last, therefore, after one of the most severe and steady cold winters we have experienced for years, we may congratulate ourselves that we are commencing a glorious spring, which I trust may prove the forerunner of still more glorious summer. I must not omit to mention a singular fact in regard to the Northern migration of the wild geese this spring. Not a single flock has been observed passing over this portion of the province up to date (April 10). They were kept to the eastward outside the coast line, or have they taken a line more to the westward—over Maine and New Brunswick? I have never known them to fail us before.—J. MATTHEW JONES, (Fern Lodge, Nova Scotia.)

**A PARTRIDGE MYSTERY.**—It is hardly safe to brag of personal charms and accomplishments; one is apt to exaggerate, but I do think a good deal of my eyes, especially when directed along the gun barrel with game in the distance. Once, however, I must acknowledge they came near proving a failure. I was out shooting warblers in May, looking at trees rather than at birds, and thinking about white mud-partridge almost under my feet. I thought nothing of it at the time, but the next morning in the same place, up flew a partridge in the same manner. Looking down I discovered a nest full of eggs. "Well, old Biddy, I came near stepping on you; I will keep away and not disturb you again." The third morning I thought I would look at the bird on her nest. There was a cow path not five feet from the nest, which was close against a pine tree, and along this path I had passed a dozen times without seeing her from my home. I walked slowly along the path, looking squarely down on the bird, but saw nothing. "Well, that is great, anyhow." I turned about, walked again past the tree, and was again at fault; I could not see the bird, I did not see the leaves about the nest, "I couldn't see nothin'." Like Tip van Winkle, I began to doubt whether it was me or somebody else. A third time I came abreast of the nest and stopped. I stood half a minute in a daze, and could see nothing, but here the bird flew herself and whistled, saw the motion of the eyelid, then I saw the bird. Now, "my brothering," if you can explain this phenomenon please do so, for I cannot. I will only forbid personal allusions as to what might have been the cause, and say it was nine o'clock A. M., and I had no empty flask in my pocket.—B. HORSFORD (Springfield, Mass.).

**RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.**—Received by purchase.—One female tiger (*Felis tigris*), one male leopard (*Felis pardus*), one male oryx antelope (*Oryx leucorhinus*), two crowned cranes (*Bucconas*), two crested pelicans (*Pelecanus onocrotaphus*), one rhea (*Rhea americana*), seven male swans (*Cygnus*), two summer ducks (*Anas boschas*), one male and one female mallard ducks (*Anas boschas*), six male and six female, one male American vulture (*Morone americana*), two yellow-bellied songsters (*Helminthophila*), and one yellow-bellied sapsucker (*Caprimulgus*). Received by presentation.—One male Virginia deer (*Cervus virginianus*), two opossums (*Didelphis virginianus*), one red fox (*Vulpes fulvus*), one weasel (*Mustela putorius*), one great horned owl (*Bubo virginianus*), one mockingbird (*Mimus polyglottus*), one duck hawk (*Falco conspersus*), one sharp-shinned hawk (*Falco aculeatus*), one winged blackbird (*Agelaius phoeniceus*), ten alligators (*Alligator mississippiensis*), ten water snakes (*Prodonotus fasciatus*), one black and white snake (*Liasis fuscus*), one yellow snake (*Liasis fuscus*), one black snake (*Liasis fuscus*), one king snake (*Ophiodon reticulatus*), one blacksnake (*Liasis fuscus*), one blacksnake (*Liasis fuscus*). Born in the Garden.—One male and one female (*Camelus bactrianus*), and one ring dove (*Turtur risoria*).

**NORTH AMERICAN REPTILIA AND BATRACHIA.**—Number 21 of the Bulletin of the United States National Museum consists of Dr. H. C. Yarrow's Check List of North American Reptilia and Batrachia, with a catalogue of specimens in the U. S. National Museum. Such a check list as the present was greatly needed, for it is nearly eight years since Cope's similar publication appeared, and within that time there have been many additions to that list, and many new discoveries, necessitating changes in it. Happily the work has fallen into good hands, and has been well done. Dr. Yarrow's qualifications for the laborious task which he has just completed are well known to laborers in the field of science, and the pamphlet shows everywhere evidences of ability, experience and general fitness for the task. The collection of reptiles in the institution has been divided into two series, called reserve and general collections. In the former are included all the type specimens that have been described by the earlier writers on North American herpetology; all those specimens identified by Prof. Cope, at the time he studied the entire collection of the museum; specimens of the same species from different geographical areas; specimens which show abnormalities from the type descriptions or variations of color or scale formula. This collection now embraces 469 species and over 4,000 specimens—an unrivalled collection of North American reptiles. In preparing this list the geographical limits of "North America" have been somewhat extended, and for Dr. Yarrow's purposes all land drawn from the extremity of the California peninsula easterly to the mouth of the Rio Grande, forms its southern boundary. The nomenclature and classification employed in the list are substantially those employed by Prof. Cope in his list published in 1875. Besides the bare check list, the following important lists are included in this paper: Check list of the reserve and general series of North American Reptilia and Batrachia; notes on Testudines; list of specimens of North American Reptilia and Batrachia described by the National Museum, and indices to the generic and specific names of the Reptilia and Batrachia mentioned, to their common names, to the localities whence they have been obtained, and to the contributors to the collection.

**TENNESSEE OWL.**—Portland, Me.—This little owl of the north, but slightly larger than the common Scadian owl—that is the smallest owl known in the New England States—is not a very common species within the limits of the United States, although it may be a regular winter visitor, and it is not improbable that it will be found breeding in the northernmost part of New England. I am indebted to Mr. Montague Chamberlain, of St. John, N. B., for notes concerning the occurrence of this species in New England. In 1881, Mr. Chamberlain "One shot by Mr. James Garnett, of Grandville Stream, ten miles east of St. John city, in the middle of August, 1880. Mr. Garnett shot another at the same place December 31, 1881." Audubon recorded the occurrence of this species at Bangor, Me., "in the beginning of September." For a note of its capture in spring I am indebted to Mr. A. M. Tufts, who obtained a male specimen taken at Dexter, Me., in April, 1877; also a female specimen taken near Lynn, Mass., November 1, 1882. Mr. E. S. Boyler writes me that he obtained one taken in Penobscot county, Maine, January 15, 1882, and two taken in the same county January 23, 1882. Two were taken near St. John, N. B., and sent to that city February 17, 1882. Mr. C. A. Creighton has informed me of one taken at Waldo, Me., in January, 1881. And I am indebted to Mr. Ralph Miller, of Portland, Me., for a specimen taken by him alive, by hand, in this city, March 3, 1882.—EVERETT SMITH.

**THE CRUSADE AGAINST THE ENGLISH SPARROW.**—The question as to whether the English sparrow is an insectivorous or granivorous bird is receiving a great deal of attention at the hands of scientific bodies and the farming community throughout Pennsylvania. The opinion prevails that it is a granivorous, and not an insectivorous bird, and living when there are no buds or seeds to subsist upon. At a recent meeting of the West Chester Microscopical Society, an organization having among its members a number of gentlemen well versed in ornithology, the merits and demerits of the English sparrow were fully and freely discussed. The sentiment of the society appears in the following preamble and resolutions: *Whereas*, Outward observations and post mortem dissections have demonstrated that the English sparrows are not insectivorous birds, but are destructive to some of the cereals and the buds of the plum, peach and pear trees and grape vines; therefore, *Resolved*, That our Senators and Members of the House of Representatives at Harrisburg be requested to urge the repeal of all laws that prevent the destruction of English sparrows.—OCCASIONAL.

**VULTURES IN MAINE.**—Portland, Me.—In the autumn of 1874 two vultures (*Corvus aeneus*) were seen in the town of Standish, Cumberland county, Maine, and one of them was caught in a trap. My friend N. C. Brown, of this city, has publicly recorded the capture of a vulture of the same species in Union, York county, Maine, in December, 1876. Another specimen was taken at March 1882, near Mt. Pleasant, in East Fryeburg, Oxford county, Maine, by Mr. Abel Sanborn, who reports the fact to me as follows: "A dead lamb had been thrown out, and was visited by the 'turkey buzzard,' which I shot through an auger hole in my barn." This is the third vulture of record as taken in Western Maine. Its skin has been preserved.—EVERETT SMITH. [The capture of this last specimen was announced in FOREST AND STREAM of April 26 last.]

**THE LATE MIGRATORY BIRDS.**—We shall doubtless have this spring a migration of all the late-coming birds in a body, as it were. May 5 to 12, when the season is an average one, are the dates the writer has always looked for the warblers to appear. If the spring has been an early one, warm and pleasant, their passing through occurs in separate bodies, gradually; but the backwardness of this season will delay the little songsters until the last moment, when they will all go through together. So, likewise, we may expect the spring flight of shore birds, especially the robin, snipe, brown-backed and black-breasted plover, and those who will kill them in May must catch them during the few days they will be seen on the coast.—HOTO.

**THE MURRES.**—In my closing remarks about the two species of murrets known on the coast of Maine (FOREST AND STREAM, April 19, 1888) there occurs an error in application of the descriptions of the "Tomia." Tomia of upper middle size, with dusky bill, dusky yellowish, and dusky short-billed species (*brimicollis*), and "Tomia" (leathered at base) applies to the long-billed species (*triale*).—EVERETT SMITH.

## Game Bag and Gun.

GAME RESORTS—If we are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

### TRANSATLANTIC NOTES.

I ENCLOSE some extracts from a letter received lately from a friend, who is now traveling in Europe:

"I have been away now more than eighteen months, and can hardly realize that it is so long a time. Last winter we were quite busy traveling in Egypt, going up the Nile to the second cataract, and in the spring through Palestine and Syria to Greece and Constantinople and up the Danube to Vienna.

"On the Nile I found game birds much less plentiful than I expected to see them, although if one took the time a good deal of sport could be had along the banks. There are a great many birds of fine plumage, herons, penguins, cranes, etc., and any quantity of pheasants.

"We traveled through Palestine and Syria, camping out on our way to Damascus, and in one section of the country we passed through we secured up any number of quail; but as I had neither dog nor gun it was only an aggravation.

"Here in France [writing from Paris] guns generally used are of 14 and 16 bore, 12-bore are rarely seen, and 10's are absolutely unknown.

"Waterfowl shooting in France is very little, if any, practiced. I see ducks going for sale, but they come from Holland. The only kind I have seen have been redheads, and another that is a mallard or looks like it, they sell at about one dollar each. Partridges, which are considerably smaller than ours, bring about seventy-five cents each, and quail, at this season, forty-five or fifty cents each; earlier, when more plentiful, thirty cents each. A great many pheasants are sold here. I don't think we have them in America, at least I have never seen them; they are birds of fine plumage, but I don't think they are worth the much better eating, they sell at eight to ten francs each. All kinds of game and poultry here are sold by the piece, and as you can judge are very dear.

Mc.

### THROUGH THE WILDS OF TUCKER.

HEARING of an undiscovered country in the Cheat River district in Tucker county, West Virginia, I assembled three congenial spirits to accompany me in an exploration and hunt.

Ed. J. Clair, Syd, and myself left here on September 27, via the Pittsburgh division of Baltimore & Ohio Railway, and after four hours' ride along the banks of the Youghiogey River, through some very grand and lofty mountain peaks, we stopped one hour at Cumberland, Ind., for dinner and change of cars; and at four in the afternoon were bowling swiftly toward Rowlesburg, W. Va. There we disembarked, to the immense edification of the well-dressed passengers, for we were truly most wonderful to behold. Ed. J.'s gold-rimmed spectacles sadly accorded with his togery, which was made up of a part of a painfully ragged and short tunic, a shirt with worn, a battered rubber hat, and a satchel slung to its utmost. We were all dressed much after this fashion, Clair and myself excepted, for we two were distinguished by heavy leather leggings and two murderous looking rifles, his a repeating Winchester, and mine a .45-caliber Sharps.

The train moved on amid three rounds of applause; and here we were at a place that looked the "abomination of desolation"—a wooden platform well whitened with wind and rain, two wet wooden houses which answered the purposes of general stores, post-office and doctor's office. This scene was enlivened by four plain frame dwelling houses perched prominently upon the ledges of the surrounding rocks—and well, we saw five men walking around languidly and smoking home-raised tobacco in the leaf.

We procured some crackers and cheese, but failed to get a team to move our luggage to St. George, the county seat twenty-five miles distant on our route. After a short delay we decided to leave our satchels and blankets to be hauled over the next day, and we would move to St. George by means of the poor man's steed—"shank's mare." We slung our rifles across our shoulders, placed our revolvers prominently in the belts and started to foot it, 12.20 P. M., expecting to make the town by dark (7.30 P. M.). We were in good spirits, for the day was bright and warm, but after the first seven miles up and down innumerable wild spurs of the range we began to take a chill and perspire more. At the eighth mile we came to our third inn-house, and one and all concluded that we must have bread or blood. The former being more after our stomachs we knocked at the door, which frowned upon us from its second story down in all its faded country glory. The first knock brought no response; at the second a small girl came to the door. She stared at us for nearly one minute and then said, "What do you want?" We insisted that we would like to buy some dinner and have some milk. "You better get no milk, but I'll see," the small girl came to the door and said, "Youns folks 'll have to take dry bread and apple butter." "Bring it out," we chorused, and soon we were refreshed and prepared to do the rest of the twenty-five miles.

Again we trudged along the monotonous road, lined on either side by dense forests of oak, beech and hemlock. About three o'clock in the afternoon a drizzling rain came on and added to our many discomforts; and at four o'clock we were all wet through to the skin. By this time I had contracted a severe cold and my back and legs ached fearfully. But I bore up until darkness set in; and then told the boys I was unable to go further on account of my back. As happy fortune would have it, we now saw a small light through the brush, away down the mountain side; and going to the log shanty we engaged a mule from Mr. John Gordon, the bearded proprietor, and in his company the procession moved on, your humble besetting the mule.

At 8.30 we forded the Cheat River twice and entered the populous town of St. George. Being too tired to look about, we stopped before the hotel, a long two-story white frame, with flagstones in front of the porch, and entered the common room of the house, which was destitute of carpet and furniture, if we except two old chairs and a kitchen table. Mr. Hawkins, the proprietor, greeted us cheerily by a hearty shake of the hand, and said: "Gents, supper will be ready in ten minutes. My ole woman wasn't expectin' ye, but I'm

glad you've come. Set down and take off your shoes." Soon we had dried our clothes, eaten supper, and were ready to retire. Clair and Ed. were assigned a double bed next to Syd, and myself; and at eleven o'clock we were neatly tucked under the sheets. At midnight we were aroused by a smothered groan from the next room, followed by horrible imprecations, while the wall resounded with peculiar knocks. This continued until daylight, and then we dressed and called upon our restless neighbors—a slight pillow to look upon. Ed., completely dressed, was seated stoically upon the only chair of the apartment, smoking a cigarette, while poor Clair, in his shirt and socks, was making a bloody onslaught upon an aggressive bedbug.

"Hello, fellows, what's all the racket about?" we cried as we entered. "Well, come to bed and look. I'm going to leave right after breakfast," said Master Ed. "Look at this sheet," he continued; "we have been fighting bugs ever since we went to bed, and I killed thirteen with mine own hand. You see Clair is half frantic," and, indeed, he looked hideous, his face covered with bites and a dangerous light in his eyes.

After breakfast we met our friend Gordon, of the night before, who laid some of our gear on the team. At 8 A. M. we were all under way in "Luke's" two-horse rig, and old Hawkins waved us a farewell as we bowed merrily out of town. At the end of the first three miles the road was simply a trail six feet wide, winding along the edges of tremendous precipices, and through fertile bottom lands watered by the beautiful little river Cheat, which we crossed six times within the next thirty miles. This river is so grandly picturesque that it deserves special mention. It originates near the St. George region, drawing its volume from many small mountain creeks and springs. It is very shallow and pebbly in some parts, and very frequently we find deep, quiet stretches of perhaps a half mile in length fringed on either side with noble trees and hemmed in by the lofty peaks of the Blue Ridge. The river in places is very swift and contains plenty of trout and black bass. For two hundred and fifty miles it flows onward through this unbroken forest and scenic solitude. The Monongahela River, four miles above the town of Geneva, W. Va., and one hundred and four miles above Pittsburgh, Pa.

The end of our journey was the region thirty miles from St. George, called "The Canaan," or as the natives pronounce it "Canaan." We had covered twenty-five miles of this rocky road without meeting a single team, when we espied an old square log shanty to the left of the road in a small clearing on the mountain side. "Guess we'll have to bunk here, fellows," said Luke, and I approached the house while the rest watched the team. When we were close by we saw a hoary-headed fellow working away at a sawhorse, his old flannel shirt thrown well open, showing his hairy bosom, while his feet were displayed in all their pristine glory, naked and large. We saluted, and he, with a cool nod, continued to saw. "Can we put up here for the night?" we quavered in weak voice.

"Go along the house and as the women folks, I hain't got nothin' to do with it," responded this ancient creature; so we knocked at the back door and found his wife, Mrs. Long, very old and very homely, but withal very pleasant. She said we might stay, but added, "We kent give you much."

Up we came with the team, unlatched near the front door and tied the horses to the wagon wheels, giving them some oats which Luke had brought with us. We sat upon the front door step and long sawhorse waiting for supper, and soon the boys began to come in from the field. The clans gathered steadily until we had an admiring crowd of six people, who proved to be members of the immediate Long family. There were Jake and Pete, and last, but not least, among the boys Charles, a cadaverous rustic of eighteen summers. The boys, as usual, gathered around the guns and examined the Winchester repeaters; but neither seemed to step upon the old breech-loading shotgun in the crowd. Mr. Jake, who was rigged like his companions in a short pair of pants and a nondescript garment which looked to me like a cotton flannel night shirt, took me aside and spoke as follows:

"If you men want to get shot of that 'air shotgun, I kin sell it for you."

"Ask Syd," I replied, and soon S. was undergoing a confidential examination. The old man of the sawhorse, the patriarch of the Long progeny, looked at the breech-loaders coldly and said "he had seen them new-fangled guns twenty years afore," which was an astounding revelation to us.

After each man had fired a ball at a knot on an old tree, the old woman opened the door and invited us in. "Come in, men, and eat; you her been toin yourselves aroun' a heap, and I ain't got much though."

We needed no second bidding, but went in and sat solemnly around a table of boiled chicken, boiled cabbage, and corn pone. The old man and the two boys pitched unceremoniously into the viands, and used their knives in place of forks, and being in Rome, we followed suit. After our meal was finished, Mrs. Long called the two young ladies of the house in, and they shyly sat down to the dismantled tables, and made a clean sweep. About half-past eight that evening some neighbors from South Fork arrived, and soon we were deep in the pleasures of "an apple paring bee." The young ladies, their faces dirty, hair unkempt and clothing scanty, were good workers, and we all parried away in silence. This monotony was broken twice by Pete informing Chas. E., Sr., that "Ball Duncan would be over tomorrow to git them potatoes," which piece of information the patriarch acknowledged by a grunt.

At 9 P. M. we monopolized the only lamp and ascended the rickety stairs to our bedroom. Here we anticipated the beds stared us in the face, but we had learned our lesson at St. George, and all fought hard for the third couch in the middle of the floor, preferring it to the beds. Luke and Ed. were the lucky fellows, so I proceeded to undress, or rather to dress, for the coming fray. I buckled my leggings tightly, put on an extra coat, and enveloped myself in a rubber blanket. Then I climbed upon the undisturbed bed and sought pleasant dreams. Owing to these precautions I lay awake, uneasily, but untroubled.

The next day we rushed on to Mr. John Eason's house, upon the top of the Alleghenies, and in the heart of the Canaan region. We found he had been burned out completely, but had rebuilt his house and barn upon a smaller scale. He was unable to keep us all in his one extra bed room, so, as we were five miles from the next neighbor, I slept in the hayloft. At midnight or thereabout I heard a faint rustle in the hay. I lay still and listened. A light crawling race of a horrible thought, the copperhead snake

and to my intense relief found it to be one of Eason's old foxhounds, which had come up for company and warmth. Next morning a cold drizzle and plenty of mud made the outlook anything but cheerful, and notwithstanding that Eason assured us of some black bear and a couple of bucks back on the mountain, we concluded to beat a retreat from this howling wilderness. After breakfasting upon some delicious venison steaks (our first decent meal since leaving Cumberland), and after a pleasant chat with Mrs. Eason, who was, like her husband, an educated and refined person, we left at nine o'clock and stopped for a short time at Long's to trade my Sharp's for a little black bear, Chas. E. said: "I kalklate I'll fetch some bear meat in with this 'ere. If youns fellers want to get shot of your shotgun, I kin sell it." From here we passed slowly to Cumberland and thence to Pittsburgh, saddler and wiser men. E. P. HONGES

Pittsburgh, Pa.

### TRAP AND FIELD SHOOTING.

"The time of the singing of birds has come, and the voice of the turtle is heard in the land."

NOTWITHSTANDING we have no game laws in this State worth the trouble that the apprehend of warm weather gives the birds rest until another sporting season shall come. Mating has about commenced, and there are quail enough left in all parts of our country to raise an abundant crop of young. If the weather shall prove propitious for formation and rearing, and no enemies shall prey upon the eggs or chicks, we may reasonably hope, when November comes, to have the opportunity of using many a shell in the field. Indeed, in some localities there are rambunctious birds are more numerous than they have been for several years past.

Our summer pastimes will soon begin. We have not patience enough to wait for frost for shooting, and will, in consequence, commence at an early day to rig up our trap and try our skill at puff or glass balls. I confess I do not like either, and would be glad to get some of another kind, which I have seen advertised—made somewhere in New York—but the place of manufacture of which has escaped my memory. The article is a small, round, white pigeon, nor the explosive ball, and you can, perhaps, give me such information as will place me in communication with the manufacturer or some dealer from whom they can be had.

We have no club here, and can raise only four persons who can be relied upon to enter the lists for a friendly competition. For this reason, and for no other—and we have other reasons—we have no contests for medals, badges, or prizes, or, in other words, we shoot "for the fun of the thing," and need no special stimulus to "prior the success of our intent." Our ambition is of that barren sort which delights only in honor. "The almighty dollar" does not sharpen our vision or steady our nerves. Sometimes when one or more of us get away from home, and meet with those who need the other incentives, we try to be not deficient in politeness, and get up a "scrub team" to shoot against organized sets. In such cases we do not expect any success, and by the chance of our coming out of the contest on the middle, we feel that we have achieved "glory enough for one day," and are fully compensated for the loss of the "entrance money." None of us have guns larger than 12, and nearly all use 16s. This size is ample for small game, and being light, our physical powers are exactly suited. We want no chokebores, but guns which will allow considerable margin or freedom of aim. Of course we do not calculate on killing at long range except by accident, and upon accident we depend largely for our success.

In our trap shooting we pull the string for each other, and the party who sits at the cord acts as judge. Nor do we care very much if the butt of the gun is a little above the elbow, or, indeed, how the gun is held, so that it is below the shoulder. In other words, we allow all the advantage which a sportsman takes when he is in the field hunting birds. On that score, such stringent rules are not recognized, and I confess I have never seen any reason for their requirement in the sham trials at the trap. I have seen many cases where an expert at glass balls or pigeons failed most disastrously in the field, while others who showed no remarkable skill at the trap were very effective at game. Birds in the fields or woods should be the standard upon which all other competition is based, and, as before remarked, the position of the gun used by the hunter when he approaches his prey should be all that is all that is expected. No one "walks" in on the birds thinking whether the butt of the gun is below or above the elbow, but holds as may suit his convenience. WELLS.

### "BALTIMORE DUCKERS."

AN article in the FOREST AND STREAM of May 3, headed as above, and giving a free advertisement to a place on the Gunpowder River, locally known as "Harewood Farm," is calculated to mislead a portion of your readers. In the first place, there is no such club in existence as the "Harewood Ducking Club." Ten gentlemen did pay a small fee last season for the privilege of shooting at this place, so cleverly advertised. I am personally acquainted with the "members" and will wager a handsome sum I can name five of the ten, whose aggregate bag for the entire season did not number 800 waterfowl, of every description—coots, old squaws, baldpates and redheads. I am quite intimate with two of the "club," one of whom told me only this morning, that he had not killed as many as fifty ducks during the season, and that he was in the blind one day in every week. This gentleman says he has had enough of ducking shores on which market game are privileged to shoot. The man in occupation at Harewood is a market gamester—he sells his duck. That so many ducks were at Harewood as is claimed in the article alluded to, is doubted. Certainly not half that number were brought to bag by the "members" from this city, and they, everyone, live here. But as the renter and his brother were in the blind from daylight until it was too dark to shoot, and permitted the decoys to remain out on Sundays as well as every day and night in the week, they may have killed ducks that none of the "members" know anything about.

The writer of the puff already alluded to, forgot to state that tolling is the chief feature at Harewood, and that a majority of the ducks were killed in that way, and not over decoys, for when the winds are adverse and the tides are low, the decoys are high and dry, and so remain for hours. Now, some "true sportsmen" consider tolling fun. I regard it as being exactly the same as shooting quail while yet sitting—a dog in a covey—on their roost.

The shooting privileges at Harewood are for rent. The writer has been informed that it is the intention of the man who rents this farm, to endeavor to get up a club of New

York or Philadelphia sportsmen, and reserve the privilege for himself and brother to shoot as heretofore.

My advice to whoever rents it is to expressly stipulate that no one save members of the club are to be permitted to fire a gun on the shore under any consideration.

A shrewd market hunter, up to the sharp practices of a head duck, for the last year has placed to a club of gentlemen for three or four hundred dollars—enough to pay expenses if the ducks do not come in remunerative numbers, as often happens—and by casually remarking as the contract is being drawn up, "I would like to reserve the privilege for myself and a friend to shoot when none of you gentlemen are around," will manage to sell more ducks than the ten or a dozen gentlemen will kill during the season. Has not this been the experience of every sportsman who has been caught in the trap so ingeniously baited?

GUNPOWDER.

### THE GAME OF CALIFORNIA.

NOTWITHSTANDING the enterprise and extensive circulation of your paper, I have noticed in its columns few if any contributions from the sportsmen of this State. California. I do not believe that any State or Union is favored with such abundance and variety of game, both small and large, as this.

From the little striped chipmunk—a minute simile of a squirrel—to the ponderous grizzly bear, almost any species of game native to North America may be found. For game birds we have numerous varieties—valley quail, mountain quail, doves, pigeons, grouse and sage hens, and for water-fowl almost everything desirable from the wild with mallard to the wild goose, honker and swan. Our rivers are stocked with many kinds of fish, principally salmon (for two or three months of the year), salmon trout, whitefish, suckers, catfish and shad, the two last having been transplanted from other waters, while our mountain streams afford unequalled trout fishing, and contain several species of brook trout both large and small. Were I granted space I could not do half justice to the subject in describing the many varieties of game and fish of the forests and streams of California, and will confine my remarks to such sections of the State as I am the most familiar with only—the foothills and mountains.

The northern portion of the State is for the most part broken and mountainous. From the Coast Range on the west to the Sierra Nevada on the east the country is broken and comparatively thinly settled. There is ridge after ridge of high mountains and lesser hills, and comparatively little level land can be found, except as a range or stock. The mountains and ridges are more or less covered either with heavy timber or dense undergrowth, according to their altitude. Throughout these mountains game abounds, comprising deer, bear, grouse, quails, rabbits, etc. In some sections trappers succeed very well in their season, the best grounds for fur being high up the mountain streams.

For deer and bear, probably, the counties of Shasta, Siskiyou, and Trinity are not excelled by any in the State, although the character of the country renders successful hunting more difficult than in sections where the game is less abundant but more easily accessible. During the fall and winter deer are driven from the mountains into the valleys by storms and snow, and generally seek localities where the mast is heaviest. They are tamer at such times than others, and are often found within sight and hearing of the settlements. It is no uncommon occurrence for residents of the cities and towns to be able to shoot deer, or occasionally a bear, from their doorway. In fact, I know of a stockman, who, when he desires a venison, has only to take a lookout in the morning and evening and wait for one to come within gunshot, and he is rarely without a supply of such game in his larder. So plentiful are deer in places, that they make themselves obnoxious by their raids upon gardens or grain fields, paying their visits by night. An ordinary fence is no impediment to these nimble animals, in fact they frequently choose the highest portion of a fence for their crossing places, and ignore a gate even when left open. A deer will stand outside a fence, look around awhile, flap his mule-like ears, wag his piece of a tail, and then merely fold upward and alight upon the inside with exceeding sang froid. He will then express satisfaction with another wag of his tail, and proceed to prospect for such garden "ruin" as he may prefer.

In many parts of the State, however, where deer were once plentiful, they are now scarce or extinct, and, unless the laws provided are more strictly enforced, they are likely to be entirely exterminated in time. Although the mountains afford a comparatively safe retreat, the deer are driven out by snow to the valleys and foothills, and are there killed in great numbers. Parties frequently kill them for their hides alone—making a profitable, although despicable business thereby. The result of this practice is becoming obvious, and all true sportsmen are endeavoring to enforce the laws and prosecute these infamous characters in the future.

The Sacramento River is an able ally of the sportsmen of the State and is doing good in denouncing transgressions of the game laws and in aiding to establish such laws as will protect fish and game from unlawful destruction and extermination, and its efforts are greatly appreciated.

Bears are found over a large scope of our country and occasionally trouble stockmen to great deal. They exist principally on berries, roots and acorns, but manifest a fondness for pigs, calves or sheep, when opportunity offers. The California lion is the most destructive of our varmints. They attack cattle, colts, hogs, or almost any kind of stock and frequently do much damage, although they are not plentiful except in some parts of the mountains. The so-called lion is little different from a tiger, of a light red-yellow color, long tail and the size of a large dog, only longer, and is as like in stealth and treacherousness as they seldom attack persons, but to hear one howl, and know what it is, is sufficient to terrify a person considerably. I have heard them when alone in the mountains, several miles from everywhere in particular, and I have been terrified—to state it mildly—and have regretted that such unnecessary animals existed.

There are a few lions of a human—a woman, in distress, and I blandly proclaim to the world, "a thing soothing about it, and to make it worse you can't tell exactly where it comes from, nor how far off it is. They are not good to eat—but they are good ears. They are game in one sense, but are not much sought after. I do not seek any—always inclined to leave them alone—or together, or any way to suit themselves. So I abstain from arraying their affairs before the public."

I intended to detail a hunting excursion, but will reserve it for a future letter, as this is already long. EAT.

SALIDA, California, April, 1893.

### GAME AND FISH PROTECTORS.

SECTION four of the law reads: "For the purpose of the more effectual enforcement of the provisions of this act, the game and fish protectors shall be subject to the supervision and direction of the commission of fisheries, who shall divide the territory of the State into protection districts and shall assign to each protector his district, and shall have authority, also, to assign for temporary duty in any district, a protector from any other district. The said commissioners shall require of each protector, at the close of each calendar month, a report in writing, and in detail, stating the service performed by such protector during the last preceding month, including an account of the suits commenced at his instance, the disposition made of such suits, the result of any brought to trial, and the condition of any undisposed of; and no payment for services performed, or traveling expenses paid by any protector shall be made until the claimant shall present to the comptroller, in addition to the usual oath of performance and payment, a certificate from the said commissioners that he has made the report required by this act, and has in all other respects faithfully performed his official duty. The commissioners of fisheries shall report to the Governor all cases of dereliction or neglect of duty of any protector which shall come to their knowledge, together with such evidence as they may have touching the case, and the Governor shall have authority to remove from office any protector so reported to be delinquent, after giving him an opportunity to be heard in his defense."

TEMPERATURE AND SHOOTING.—In the report of the Chief of Ordnance for 1882, which has just come to hand, we find the following interesting report of some experiments made at the Frankford Arsenal: "During December, 1881, and January, 1882, very extensive experiments were undertaken to determine why our velocities obtained in summer were so much higher than those obtained in winter, when the same charges were used, the only seeming variable being the difference in temperature of the atmosphere. Some 365 velocities were taken, with the cartridge and rifle both warm and cold, the air through which the bullet passed being about the same temperature. With the cartridges and rifle warmed by a temperature equal to that obtained in summer, and cleaned between each shot, our velocities were 1,356 feet; and with cartridges and rifle cold at a temperature of thirty-two degrees, the cartridges being kept at that temperature long enough to insure their powder from the case having that degree of heat only, gun not cleaned between shots, we obtained only 1,295 feet velocity; a difference of some 61 feet. We also found that the pressures under these different circumstances varied between 29,300 pounds when warm to 25,050 pounds when cold, and the fouling varied from 7.6 grains with cold gun and cartridge to 5.4 grains with warm gun and cartridge; our conclusions from these experiments being that the effects of heat upon both cartridge and rifle are to decrease the amount of the fouling and increase the pressure of the gases and the resulting velocities; also, that the temperature of the air through which the bullet passes has very little effect upon the velocities, and that care should always be taken to have cartridges and rifle at a uniform temperature when taking velocities."

THE GUNXONIAN COUNTRY.—During the year 1880 I spent about eight months in the Gunnison and San Juan country in Colorado. My headquarters were at Mountain City, about sixty or seventy miles from Leadville. Such a paradise for large game I have seldom heard of. My "pard" and I had a cabin on the banks of Castle Creek, which emptied into Roaring Fork River, two streams of which I could tell many wonderful trout stories. There were three German brothers, who were working a claim seven miles above on the Maroon Creek. Theo. carried a Sharps rifle, Jim carried a breech-loading shotgun, an excellent shooter, too, the other carried a double-barreled shotgun. They had started bear one afternoon about five o'clock, but had not been gone more than an hour when they came back very much excited, saying they had killed a grizzly bear. It seems that when a mile and a half from the cabin they heard bushes crackling behind them and saw the bear following them. Theo. fired at once and struck the bear in the right side of the face. Jim, scared nearly out of his senses, fired both barrels of his shotgun loaded with buckshot and fortunately broke the bear's backbone. They soon put an end to him. Three such scared Dutchmen and we all had a feast on bear steak.—P. S. (Buffalo, N. Y.).

ONONDAGA COUNTY, New York.—I believe I could yoke in with "Nessmuk" on many points. I observe he don't have the "whisky bottle" among his equipments, and own that I am at a loss to understand why so many sportsmen cannot go out for a day's shooting, even at glass balls or clay pigeons, without a whisky bottle or a keg of lager. I have been fox-hunting the past winter where some of the party were drunk carried today and the next day. I wonder that some men objected to such parties, and I don't wonder that some men acquiesce in such parties, and concluded they didn't care to have their sons acquire a taste for hunting and whisky combined. Game of all kinds has nearly left these parts. We found where four partridges had been eaten by foxes this winter, and I believe foxes eat more than are killed by sportsmen.—NOVICE.

NOTES FROM COLORADO.—Como, Colorado, April 30.—Duck shooting here in South Park has been rather poor this spring. The ducks have been plenty, but very wild. However, I have shot twenty in three days' hunting. Most of the ducks are redheads, mallards and gray ducks. Yesterday I drove to a lake six miles from here to dig me a blind, and saw the first flock of curlew I have seen in the park. I find it very difficult to judge the distance of game at this altitude (9,800 feet). The air is so clear, that the game appears much nearer than it really is. This makes duck shooting much more difficult than on my old hunting grounds, on Lake Champlain.—F. B. J.

DOWN THE MISSISSIPPI.—May 3.—I have found plenty of duck down the Mississippi, that is as far as I am. The first day out from Louisville I saw three flocks of mallard, the third day out while I was sitting on the boiler deck I saw three single ducks, four pairs, and nine large flocks within a half hour; the fifth day out I saw seventy-five ducks within five minutes and within four miles of Vicksburg. I expect to see many more before the trip is over.—JEM.

SNIFE SHOOTING.—The snipe have made a late appearance on the Jersey meadows this year. Mr. Justin Von Lengkerke was out the first of the week, and reported nine killed out of ten found; and this in the wake of two other gunners. In Connecticut, we are informed, Lyme is a good point for snipe shooters. Go to Clark's Hotel and engage the services of "Bill" Flint, who is a good guide for the Essex meadows and the Ely meadows near by.

A GALA DAX.—Muncy, Pa., April 22.—The oldest sportsmen say that for a great many years so many ducks have not been seen on the river at this place as on Friday last. It was a grand old holiday for sportsmen. The little steamer Full Moon, owned by Captain John M. Bowman, steamed down on Muncy Dam, a beautiful sheet of water, and on their return home the captain and party shot forty-seven ducks.—FULL MOON.

MISSISSIPPI.—Brookhaven, April.—Quail shooting the past season was unusually good. The freedman of this section is one of Bob White's most harmless enemies. Neither his trap nor army musket has much to do with the extermination of our favorite game. I know of but one darkey in the county who shoots on the wing, and he being an industrious fellow spends very little of his time hunting.—I. L. G.

TEXAS QUAIL.—Indianola, Calhoun County, Texas, April 30.—We are having a very cold, backward spring, and there are some ducks here yet. If some of your readers wish to shoot quail they ought to come out in this section; across the bay from us, three miles, there are thousands, and they are hardly ever shot at.—A.

THE OWL CLUB has been organized at Lynn, Mass., for the promotion of gunning and fishing. The membership is limited to eight. The constitution is printed in a dainty little pamphlet, with a design on the cover like a *Psi Upsilon* initiation card. We wish the *Bubo* a long life.

BLACK FLIES AND MOSQUITOES.—To the many repellants already noted in these columns, we add another, namely, citronella, the oil of the lemon verbena. This is agreeable to use, has a pleasant odor; and our informant tells us it is as effective as the oil and tar combination.

THE SEDALIA GUN AND SHOOTING CLUB held a meeting at the Park, Sedalia, Mo., last Monday. The officers are: J. W. Trader, President; E. C. Evans, Vice-President; J. C. Parmelee, Secretary; John Montgomery, Treasurer; F. Houston, Attorney.

### Camp Fire Flickerings.

"That reminds me."

SPEAKING of digging a blind "reminds me" of the old method of concealing himself used by an old friend of mine, "Hank" was possessed of an extraordinarily large understanding, and was never known to black his boots. When duck hunting, he would lie down on his back, and put his feet up in the air, which would effectually screen him from the observation of the ducks. In this way he would often come home with his bag well filled, where others would utterly fail. F. B. J.

COLORADO.

### Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

"Fishing, if I, a fisher may protest.  
Of pleasures is the sweetest; of sports the best,  
Of exercises the most excellent;  
Of recreations the most innocent.  
But now the sport is marred, and woe to why  
Fishes decrease, and fishers multiply."

—Thomas Bastard, in Collier's "Poetical Decameron," Vol. 2, p. 105.

### A TRANSFORMATION SCENE.

Editor Forest and Stream:

Will you accept a short story? I was going to add "a fishy" one, only some might accept that adjective in its wrongful sense, and imagine that truth was not the basis of the narrative, which it certainly is.

Colonel D. T. and Mr. H. were spending a few days at their fishing and shooting lodges on the island of Long Point, Lake Erie, some time ago, and one afternoon were quietly yet quickly, capturing some fine green bass, and enjoying their sport.

The Colonel hooked what he deemed a three-pounder, and gave the gamy fellow plenty of time and line, inasmuch that uninitiated onlookers might imagine almost that he was tying a kite in the lower world, or exercising some fractious phantom colt, which, like the solar eclipse this year, is invisible to us; but nevertheless the Colonel's head, like his hand, is calm and cool, and experience has taught him the value of the maxim, "a lost fish is cheaper than a broken rod." At last it does its work, and the apparent three-pounder begins to show himself on top of the water. I say "begins" because it took quite a while to show all of himself, for he was no longer a three-pounder, but a thirty-pounder; he had grown in the struggle; he had likewise changed his name from bass to muscalonge. A wonderful life he must have led during the past ten minutes. Silently did the gentlemen look at one another, then at the fish. Quickly did the attendant exchange the landing-net for a gaff-hook. With a word was spoken not a muscle moved, only the color in the angler's face, yet I doubt if all the glory fields of glory through which the gallant Colonel had passed found him thinking more in the same period of time, than did this change in his piscatorial luck. The gaff-hook is softly lowered by a somewhat shaky, excited hand, and the fish is also lowered by a somewhat similar disposition, and both disappear, the first into the scow and the latter into twenty feet of water, and

once again the Colonel finds himself obliged to exercise his patience and discretion, but at last succeeds once more in guiding his prisoner sufficiently to bring him in view, which strange to say, is no longer the same third-pool muscunole, but he has retreated within the skin of the three-pool bass again.

Oh! horrors! Is my mind wandering? Is it April? Are my eyeglasses telescopes, that I have turned end for end and seen deceptively? or are any other kind of glasses to blame and account for the phenomenon?

We give it up, as the Colonel did, in a sort of "lance-fer" manner, and content ourselves watching the hand lower the once discarded net, and take possession of the first-supposed three-pool bass.

If I may be allowed to speculate on the above, I should guess that the muscunole mistook the bass for bait and caused the whole mistake, which when discovered he disgorged and so did the Colonel disgorge (not the bass), but a few words and epithets.

—T. W. BOWEN, Ontario.

## QUIET SPORT.—II.

BY MULLARD.

**K**ISSING his lily-pads, waltzing with ferns and buttercups, nodding to every bug, rippling the lake and deliciously pungent with the resinous odor of pine and balsam, came the early morning breeze. The morning light shimmered over the lake, and struggled among the trees before the rising sun gave it a few hours of solidity. "Birds with music-making ho-oms" were pouring forth their treasures of wild melody; and then came the softest blush in the east, as our cook prepared to struggle with flamed flap-jacks.

Such mornings belong only to the forests, where each one comes "like a maiden's love, full of bloom, purity and freshness." There is wine in the air, which produces an exhilarating effect, but does not put your eyes in mourning. It is not associated with headaches, nor will it cause you to be fined ten dollars and a promise of future good behavior. It is a cordial of almost incredible virtue.

Cook's flap-jacks were light and tender, the coffee clear, the bread tolerably light. Roy had caught four fine trout, which the cook hurriedly disguised in a salt and pepper suit, with pork trimmings; and we scattered over lake and inlet and outlet, as we fancied.

Ward, as we remarked when we left the stud old town of Goshaw, was a true lover of the woods, but he was a median angler, ignorant alike of the dancing fly and the lightning-bug of the trout. He knew naught of trout fishing in its excellence. The slimy angle worm, the fat grub, and the dull thud and steady pull of bottom fishing, were to him the beginning and the end of his piscatorial experience.

He had always spoken depreciatingly of the little imitation gnats, fly-lines, and light rods, but had been prevailed upon to invest in an outfit, and had accordingly provided himself with a most formidable lot of fishing tackle, always insisting that he expected to derive about as much sport and pleasure as a mosquito would extract from a snow-bank. But when he saw the ease and grace with which Glen delivered his flies, the intensity of his faith in his own ability to perform as well, and the fervor of his zeal approached the sublime. He knew he could do as well with an hour's practice. He paddled his raft to one of the favorite parts of the lake and commenced to flourish his flies, which he did as awkwardly as a cow would dance on ice or a nut eat corn from the cob.

Glen, without speaking distance, advised and cautioned him, and noted a gradual improvement in his method; and after he had snapped off a few flies he thought he began to get the "hang of the thing," and took it up—in fact went it alone. It was a fishing day every inch of it. The trout were in feeding mood all around, but Ward missed three rises with an accuracy and precision really wonderful.

His rocate predictions were fast vanishing. His patience and his fly-bait had been well tested, and he began to think fly-fishing was not as easy as his fancy painted it. There he was, during the long morning, squatted on his raft, a premium specimen of a piscatorial dilettante. Mr. Miacawber would surely have stopped waiting for something to turn up. Job would have lost his submissive reputation and said, here, old fellow, take my hat; and Patience came down from off the mountain and said, "The handsome fellow is competing with Ward would surely have been awarded no honor above highly commended.

After long waiting, and when even he had commenced to flidget with anxiety, presto—a flash, and he had accidentally struck. The trout's movements were quick and subtle enough to disconcert a tyro, and he had his own peculiar way of dealing with matters and things. As he "flashed from the full-flashed wave" our friend was not polite enough to drop his fly, and a gentleman. The handsome fellow deserves your most obsequious bow. Do not let him injure his tail by having it come in contact with your leader. Ward was suddenly seized with a nervous and excitable paroxysm, and consequently his first impulse was to grow the least mite pale, which paleness rapidly developed into as near an approach to whiteness as a living face can. His cheeks changed from eagerness to uncertainty, from uncertainty to despair. He was as badly off as a man with two dollars and no wires. All these colorful and surroundings increased it showed that his case had developed into buck-ague—the tip of his rod broke, and the leader parted. "Great Caesar dead and turned to dust; could that little trout have escaped and left me thus?"

Ward was as pious at home as he was excitable here. He read his Bible in preference to Boccaccio, and his walk was upright. Let us draw a veil before him and forget the strong, nervous Saxon he employed in depicting his lack, lack of nerve and excitability. He did not relax in expressing his own opinion of himself, but we will, for others have forgotten themselves. The rise, strike and escape were so sudden that it seemed a dream, but here's the tangible evidence that mischief had been done. A man as sadly demoralized as the Knight of the Sorrowful Countenance after his attack on the windmills, a missing leader and a broken rod, were more than circumstantial evidence of trout's late presence in the air.

Despondent, yet resigned supreme in his corporosity, and deprecatingly dubbing himself the Jonah of the party, he paddled ashore to seek the comfort the shanty afforded, and there we found him when our morning fishing was over, and we returned for a bite and a boat until the late afternoon fishing on the lake. As Ward's rod was broken and there were several others to be repaired, Roy, a good amateur workman, offered to supervise the putting of them in order. It was a delightful lounging place; and not thoroughly

rested from yesterday's tramp, we employed our time between looting and the little trifles that help make a camp a pleasant place.

Beds of boughs were made; the roof of the shanty patched up; some unbrushed, which had a bad habit of switching us as we went to and from the lake, cut out; the spring was despoiled, and several seats made; but the great master job was the table which the cook erected, yesterday, for it was away up in the air. It was a grand looking off place for the birds. If we leave it so, perhaps some one will stumble across its magnificent ruins in the ages yet to come, and will say of it: "There were giants in those days, for here is the evidence of their one-time existence. How wonderful, and to what puny dwarfish growths have we descended." How they would have mourned the decadence of the human corpus. However, as posterity had never done anything for us, we consulted our own convenience, by chopping off a few feet from the table and lowering it to a level with our chairs.

Meanwhile Roy was busily employed in repairing the rods that had suffered during the morning's sport.

"Twixt the camp-fire and the shanty  
Sat the expert tackle-mender,  
In the land of spruce and hemlock,  
In the land of running water,  
Mending fishing-rods of bamboo,  
Rods of lancewood and of greenheart.  
Some were pretty badly busted,  
Busted at the tip or reel-place,  
While some others scarcely scratched were.  
He was thinking as he whittled,  
Whittled on the joints and whittled—  
Doing these three things at once—  
Of the sport he'd have to-morrow.  
When the morning sun was shining,  
Shining if it wasn't cloudy;  
If 'twere cloudy, all the same,  
When it rains we're higher water.

But to catch the Fontinalis,  
Speculated brook-trout, prince of fishes,  
Could the old man surely chance it?  
Would the old man go a-fishing?  
When the brook was rising higher,  
Its waters creeping up the bank,  
"Whirling round and round and downward,"  
You can shout your affirmative.  
You can take your affidavit.  
He would take his rod and chance it.  
Where the rod was badly damaged,  
Where the pole was busted badly,  
He'd kinder pestered up with glue  
And sent around it thrills of stings and  
Winding round and round and tying.  
And then kind er kalsomine it,  
Kalsomine it with some varnish  
That he carried in a bottle.  
Soon the rod grew convalescent,  
By-and-by grew well as ever;  
Then the old man stopped his whittling,  
Stood erect and stopped his whistling,  
Handled Mr. Ward his greenheart.

"There's your rod, old fellow, with a new lease of life, but don't do any more quick, heavy lifting with it. A slight movement on the wrist, produces a wonderful movement at the tip of the rod. But it away until to-morrow and it will serve you many a good turn if you treat it right."

## ANGLING FOR WHITEFISH.

**I**N your issue of April 26 is an article on angling for whitefish. I have seen a great many whitefish taken in various ways, with pound nets, gill nets, seines and with spears. But I have never seen one taken with the hook, or rather I do not know of one instance where this fish has taken the hook. They are sometimes hooked in the body and taken from the stream in that way, but that is not of very frequent occurrence. I know of different persons who have angled for them in the Detroit River in the fish pens where there were thousands of whitefish, and I do not know of one instance where they have been successful in taking one. It is an established fact that the fish does not feed on animal food. I have made inquiries of different fishermen on Lake Erie, Lake Huron and Lake Michigan, and only one opinion is found to prevail among them. They say the whitefish will not take the hook.

This fish is sometimes speared among the ice at night, by cutting a hole about two feet in diameter on top of the ice, and three feet underneath, the object of this being to better facilitate the landing of the fish. The hole made, a stake is usually stuck in the ice to support the light. Everything being ready, the spear is taken in hand and developments awaited. The light attracts the fish, and as he slowly rises to the surface, the fisher ever on the alert, plunges the spear into him and the fish is taken.

The natural home of the whitefish is the great lakes and rivers, although they will live in inland lakes where the water does not reach a very high temperature. The average weight of this fish is about two pounds, although I have seen specimens taken that weighed from twelve to fourteen pounds. It is possible that there may be instances where this fish has taken the hook, but it is not probable. A great many persons have confounded the whitefish with the lake herring; and in fact if you take a whitefish weighing one and a half pounds, and a herring of the same weight, it would require an expert to tell which is which. They are nearly of the same color, their fins and scales are nearly the same, and a whitefish and herring weighing one and a half pounds each would be nearly of the same structure or form. There is one way by which the whitefish can be distinguished from the herring. The upper part of the whitefish's mouth is the longest, which is the reverse with the herring, the lower part being the longest. The herring are often taken with the hook during both summer and winter, and I do not think it matters what kind of bait is used. They are a very good food fish, taken when the water is cold, but if taken during the months of July and August from streams where the water is warm they have worms in them. This fish is not to be compared at any time with the whitefish. Those who cultivate whitefish for their sporting qualities will find their labor lost. But as a table fish it has no superior among our fresh water fishes.

MARTIN E. O'BRIEN.

MILWAUKEE, WISCONSIN.

[We have been told of two or three cases in which the lake whitefish have been taken on the hook, but such occur-

rences are unusual, and, we presume, accidental. We know, however, that the Rocky Mountain whitefish will readily take a fly, for we have caught a great many of them in Montana in this way. Standing on the rocks in one creek we have, in three successive casts, taken, on a red bib as a tail fly, a trout, a grayling and a whitefish.]

## WOODMONT ROD AND GUN CLUB.

**W**E supplement the frequent notices in these columns of the Woodmont Rod and Gun Club of Washington, D. C., with the following particulars, which are extracted from the Washington Star:

The character and purposes of the club will be pretty well understood by its title; but they are still further emphasized by its corporate suit, which includes as its appropriate device an antlered deer's head and two conventional dolphins on a shield, which is supported by a heraldic scroll bearing the legend "Protect and Enjoy." This is in plain English, as it ought to be, in order that the honest unlettered hunter or angler may be able to understand it without securing the services of an interpreter or referring to an English-Latin dictionary on the fly.

Like most of the successful and useful organizations of its class, the "W. R. & G. C." began in a modest and humble way, though its founders took the wise precaution to secure at the beginning a well-located and ample field for its operations. This was found in a large old estate situated in Washington county, Md., bearing the appropriate title of "Woodmont." It lies a little above and nearly opposite Great Cacapon station, on the Baltimore & Ohio Railroad, about one hundred and sixty miles west of Washington. The original purchase consisted of 2,022 acres, but the amount has since been considerably increased by later purchases, and in order to extend the hunting privileges as well as to properly protect game, etc., the control of a large additional acreage has been secured by lease. The estate is situated on the north or left bank of the Potomac, as already stated, and extends from the river on the front to the old National Road in the rear, and from the base of the Tonoelway Mountain on the east to the foot of Mt. Solon on the west. Less than ten years ago this estate was valued at and was sold for \$22,000, but of course it cost the club no such sum. With the exception of about one hundred acres the entire estate, with its leased dependencies, is heavily wooded with fine large timber, and in places with heavy undergrowth, which furnishes a most excellent cover for game of all kinds to be found anywhere in that section of the country. Deer and turkeys are by no means scarce, while small game, both fowl and animal, abounds in the woods, and in season ducks are plentiful on the river.

The advantages presented by Woodmont as a resort for anglers may be at least partially understood when it is stated that the estate has a frontage of three-quarters of a mile on the famous Potomac fishing grounds in the vicinity of Dam No. 6. The locality affords opportunities for both deep or still water and rapid water fishing. Below the high dam the river runs for several miles over a rocky bed, thus furnishing a long stretch of tumbling cascades, circling eddies, and quiet pools, ever greatly affected by game fish of all varieties, and always so tempting to the angler's eye. Above the dam there is a level or pool extending some three miles to the westward, in which the water is always deep and still, and beyond this lake-like sheet of quiet water shoals and a swift running current meet again. All these several divisions are filled with the small-mouthed black bass, which is now recognized by both scientists and anglers everywhere as next in game qualities and delicacy to the spotted trout, and by some placed even above that universal favorite. Something of the quantity and size of the fish in this particular locality may be inferred from the statistics of the club for last season. The summer of 1882 was not regarded as favorable one for anglers, nor was the next season, as fishing done by members of the club, or its guests. In fact, there was seemingly less than the usual indulgence, whether numbers or time be considered, yet the catch for the summer added up 1,296 bass, weighing 956 pounds, or nearly half a ton in all. Perhaps the majority of these were taken with live bait, but a very fair proportion fell a victim to the seductive fly—not a few of the members declining to use any other device.

In business as well as in sports, having been there for nearly thirty years, may now be considered as acclimated and thoroughly at home, the Potomac at this point has been liberally stocked during the past two years with land-locked salmon, and large numbers of young brook and California trout have been placed in the streams emptying into it at that locality. It is too early yet to judge of the final results of these experiments, but a number of small salmon year at least that at least doubtless are now alive and thriving, and there is every reason to believe that the enjoyment of the angling fraternity will be soon and greatly augmented from this source.

The living accommodations of the club consist of a large new and fine club house, situated on a high bluff, overlooking the river and a beautiful range of country beyond, which cost, with its substantial fittings, about \$6,000. The building contains a fine club room, a large dining hall, a magazine room, store room, linen room, servants' room, and ten large, fine chambers, all comfortably furnished. In front, and running around each end of the building, is a covered portico twelve feet deep. In the rear of the main building, and connected therewith, is the kitchen, and also ample quarters for the superintendent and his family. In connection with this establishment there is a stable and other necessary outbuildings, an excellent cement-lined cistern, holding more than 12,000 gallons of water, and an ample icehouse, in which is now stocked upward of 100 tons of excellent ice. Near the center of the estate, two miles back from the river, and in the midst of the best shooting, is a comfortable hunting lodge, containing six rooms, suitably furnished. This and two or three other houses situated at different points on the estate are occupied by the game wardens of the club, who look after its interests generally, and see to the enforcement of the game and fish laws of the State.

Already the efforts of the organization in this direction have been productive of the most encouraging results. Immediately upon entering upon proprietorship it turned its attention to the general protection of game in the vicinity, under the provisions of the Maryland laws, and the prevention of poaching on its own premises, which are formerly "posted," in accordance with the legal requirements. Through the efforts of the club, and the aid of the State, poachers and trappers and law-breakers have been arrested and punished so that now close seasons are beginning to be observed, and private rights are respected to a greater extent than ever before. In consequence game has steadily

All the above are sent free on application to the roads publishing them.

Don, Samuel Seaborn's Don, G. E. Spear's Dick Turpin, A. McCollom, Jr.'s Professor Don, Dr. A. McCollom's Tally-Ho, R. Lamb's

**Q**UICK recent visit to Boston is quite a refresher, after reading the following extract in a New York publication: "As a watermaster of fact, the late John W. Aldrich, of Franklin Dexter, is the only cutter that is now building in the United States." The writer goes on to say that when he puts such nonsense before his readers, must know it is purely untrue. We have only to quote another extract in the same issue to show this to be the case, for he goes on to say: "Mr. Byles, of City and Northborne, from design by Mr. Harvey, the designer of the cutters Redoubt and Wenonah. This is the only boat of its kind that we have heard of thus far this season." Now this cutter yacht for Messrs. Zerega and Northborne is 35ft. by 7 ft. 6in. on the water line, and will have a draft of water of 7 ft. Surely these are proportions

## Harrison's Celebrated Fish Hook.

Registered.

Trade Mark.

Whereas, It having come to our notice that some unprincipled hound, to gain their own unworthy ends, and to attempt to damage our good name, having spread reports to the effect that the manufacturers of the above hooks are defunct, we now take this opportunity of informing the American and British public that such reports are utterly false. The same efficient staff of workpeople is employed as heretofore, and we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours, and we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours, and we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours.

Signed: H. HARRISON, BAKELLET & CO., Sole manufacturers of Harrison's Celebrated Fish Hooks, Redditch, England. (December, 1882.)

Manufacturers also of Fishing Tackle of every description. Sewing and Sewing Machine Needles.

READY MAY 14.

## Stevens' New Model Pocket Rifles.

Weight of 10in. about 5 lbs.

**NEW MODEL POCKET RIFLES.**

.22 or .32 cal. Rim Fire, with Combined Sights. 10in., \$12.25; 12in., \$13.35; 13in., \$15.00; 18in., \$16.50.

**A MATCH WITH POCKET RIFLES.**

From *America's Field*, April 7, 1893. We learn from the *Breeder and Sportsman* that a very interesting match was shot at Shell Mound Range, San Francisco, Cal., March 16, between Mr. E. F. Hovey, Sr., and Mr. Ed. Hovey, Jr. The shooting was done with .22 cal. Stevens' Pocket Rifles, 10in. barrels, on the 10 yds. target, with bullseye. The accuracy of these little weapons is surprising. The shooting was off-hand. The following is the score:

Ed Hovey, Jr.....	55 555 55554-47
.....	5055555545-49
.....	555555555-48
.....	455555555-48

## Kennedy Repeating Rifle

**The Latest and Best.**

Greatly superior to any other Magazine Rifle yet made. The solid metal in line of fire

at time of discharge renders the Kennedy ABSOLUTELY SAFE.

These rifles are made .44 cal. 40 gr., and .45 cal. 60 gr., using the same ammunition as other magazine rifles.

Can be obtained from any first-class gun dealer in the United States and Canada.

## AMERICAN Kennel Register.

A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the Register contained the pedigrees of 138 dogs.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the Register contain prize lists of Washington, Ottawa and Pittsburgh shows.

The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry blanks for each department will be furnished free on receipt of stamped addressed envelope.

TERMS:—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, AMERICAN KENNEL REGISTER, P. O. Box 2, 332, New York City.

## Rare Opportunity!

**Great Sale of Colt Breech-Loading Guns for Summer Holidays.**

In order to reduce stock, we will now offer our entire stock of Colt guns, not extension rib, at retail for sixty days at regular wholesale prices. These guns are all sizes and qualities, from the twist pistol grip, \$55.00 list, to the Laminated Steel or Damascus, \$80.00, 38 to 3in. long, 7 1/4 to 10lbs. weight. Among the stock are a few of the celebrated Trap Bar-Killing Guns. These guns are all made of extra quality of barrels, and are made with great care, especially for close and hard shooting, and we have never seen anything yet to excel them at long distances. Price lists sent on application.

already opened the eyes of many to the inefficiency of our local rifles and military rifemen. The match will, at least, act as a guide toward the better arming of troops, whether regular or volunteer. How generally that guidance will be followed remains to be seen.

THE BURRO AND THE BEAR.

Heels and the jack I sing, who first on Mariposan hills, etc.

—After Virgil.

TO the layman the formalities of the law are mysterious and awful. The court and its satellites, the counsel for the opposing parties, the spectators, and even the building itself seem all parts of a gigantic and insatiate monster, which devours alike the substance of the well-to-do, the hard-earned earnings of the poor, and the scanty savings of the widow and the orphan. It is never satisfied. It always cries for more. Often it foments quarrels and disputes which might well enough be adjusted in a pleasant and friendly way, without recourse to its terrible process.

It is in the outer sections of our country that the law is most to be feared. In newly settled regions and on the frontier, the sense of justice innate in the human heart, makes speedy decision in criminal cases, and in those where one individual has wronged another, the rifle or the side shooter is the sharp arbiter of quarrels. There are none of the proverbial delays, no interminable cross-examinations, no long-winded speeches or proxy charges, no looking up of juries, no appeals or requests for a stay of proceedings; above all, no fees to be paid the court, no retainers to counsel. The settlement is short; there are a few sharp reports, a little whizzing of balls, and the plaintiff or defendant either falls, or limps away, satisfied, or, at least, willing to wait until such a time as he can get the drop on his opponent and make his appeal with better chances of success. In older countries there is a sadder state of things. It takes years to try a simple suit, and usually costs the parties more than the amount in dispute. Besides the wrath that one naturally feels at being deprived of his money, there is the heart-shaking suspense and anxiety of the delay—that hope

WITH the opening of the formal trial shoots between competitors for places on the American team, the outlook becomes more and more encouraging. Very well sustained scores have been shown by many of the contestants, and although the field is not a very large one to select from, it is quite evident that the committee will have no difficulty in drawing together a body of a dozen shooters which the British team will have hard work to beat. We hear of no complaints thus far, and it seems likely that the men will go on the team because of their ability as shots. With such a team, organization and discipline will be easy. Riflemen respect a brother shot who can stand fairly and squarely up and beat them round for round on the record, and they are willing to step down and out when the record is against them; but no team can be brought into a good working body when it is gathered up by a series of appointments. Rivalry is too large an element in the success which has heretofore been met with by American riflemen to permit it to be placed aside now. With a team picked out as the team of 1883 seems likely to be, there will be no long-continued chorus of grumbling in case of defeat, and only the more hearty congratulations in case a victory should reward the efforts of the visitors.

It will be remembered that in the match of last September the scores of the two teams stood 1,975 points for the British and 1,895 for the Americans, or averages respectively of 164 and 150 points per man, there being twelve men on each team. It will be seen how much above this average the scores are now running for the leading twelve. Bald comparisons of figures are, of course, very misleading, but in the present instance the showing made by the men now practicing at Creedmoor has behind it some real elements of strength. A year ago the preliminary practice was marked by some very unsatisfactory features, which we hoped at the time to see eliminated when the organization of the team was brought about. Instead, however, new elements of discord were introduced, and incompetency at the head produced a natural result in a scattered effort on the part of the men. The lessons of that fiasco have been well learned, and a suitable arm having been carefully prepared, the men were required to use it, and thus make the trial now going on of men, rather than an exhibition of the experiments which they might be induced to try.

apple of his eye. In the summer of 1901, when the weather was unusually warm, the cattle would look fondly at them as they walked out from the corral to go down to water, and at evening after supper he would sit and smoke his pipe and contemplate them, finding each day a new beauty in some favorite heifer, steer or calf. They were fine cattle, and their owner was justly proud of them. None were sick; none died. They increased, flourished and grew fat. In the winter they fed upon the yellow grass upon the hillside; in spring, when the gentle rains had caused the alfalfa and alfalfa to send up tender shoots, they stood knee deep among the luxuriant and sweet-smelling herbage. But all this was too pleasant to last. A serpent entered Eden—and a grizzly bear Mr. Black's corral. Night after night the fattest and sleekest of the calves were ruthlessly torn from the sides of their helpless dams and hurried away into the fastnesses of the mountains. Day after day their owner saw in the once mild and placid eyes of his herd a startled, hunted look, an expression of appeal which wrung his heart. Mr. Black was in despair, and, determined at any cost to be rid of this fiend of a bear, he published an advertisement offering a reward of \$50 to any person who would kill it.

 ANSWERS TO CORRESPONDENTS.

DOG SHOWS AND DOG PRICES.

*With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.*

OUR esteemed correspondents who have been discussing the prices paid for dogs appear to have overlooked one important factor in the growing appreciation of canine property, namely, the bench show. The direct result of such an exhibition as that given in the Madison Square Garden, this city, last week, is to stimulate the public interest in dogs, and stimulate the market for them. With the improvement in breeding has come a wider appreciation of the several strains, and a correspondingly greater demand for well-bred animals.

An instance illustrative of this came to our notice the other day. A gentleman, who took no special interest in dogs, and was rather inclined to ridicule his friends who did, was induced by one of those friends to visit the Westminster Dog Show. He entered the Garden indifferent at best; he came out of it an enthusiast, a thoroughgoing one, too. His suddenly acquired fancy was not confined to any one breed; it took in the whole show. This new "dog man" is to-day the happy possessor of a bouncing St. Bernard infant and a cocker spaniel. The spaniel, he maintains, is the only really and truly cocker in America, and in defense of his claim he is prepared at any moment to go off somewhere and establish a new cocker club all by himself.

Our correspondents aforesaid will understand that this gentleman has a long purse; and he is only one of a multitude of visitors to the bench show, who immediately or in the future become buyers, and by keeping up the demand keep up the prices. There are not enough St. Bernards bred to-day to anywhere nearly supply the call for them.

But while celebrated prize winners, blue bloods, and fashionable pets of the hour command prices virtually putting them above the reach of men of moderate means, there are thousands of better dogs which their owners perhaps bought for a song, but would not sell for a fabulous sum.

With the next issue of the FOREST and STREAM it will be pretty well known who are to be on the team, and then some calculations may be made as to their inherent strength as a shooting body. The captain, too, will have been chosen in all likelihood, and then the programme of effort will be mapped out, and the general plan of the campaign decided upon. It is to be a military team. The members will take along only weapons of the military class, except perhaps in a few cases, where some attention will be paid to small-bore practice with a view to enter in the several exacting individual matches on the Wimbledon programme. It is certain that no other team match will be shot than the one for which the men are organized and sent abroad. It will be an event of more than usual importance, for it will be the first time that a body of armed American soldiers have invaded the soil of the mother country. It will be an opportunity worth the seizing for an exchange of courtesies between the American militiaman and the English volunteer. Nearly a half-million of men are represented in these two squads who, in a few weeks' time, will face the butts in the presence of thousands at that well-known common which, for two decades past, has been the central rallying point for all that was valuable in modern rifle practice. The match has

still with dark pines. Scarcely a sound disturbed the quiet of the night. The long drawn howl of the coyote was silent, but in the *acquia*, the water murmured softly its little song. All this our hero observed and enjoyed; but as the sweet smell of the stacks reached his nostrils he remembered that life was not made for dreaming, and walk-up to the corral, he leaned against it, and with scarcely an effort, threw down half a dozen lengths of fence. Then he entered and began to eat Mr. Black's hay.

While all this was going on, a grizzly of remarkable size and ferocity was pursuing his way down a cañon toward the corral. He did not stop to contemplate the calm loveliness of the night, but went hurriedly along, for he was hungry and he remembered a particularly large and fat calf that he had twice unsuccessfully tried to catch. This time he vowed he would secure it. The corral reached, he found the fence down, and entering, looked about him. There, beyond the stacks, in the moonlight, reposed most of the cattle, but nearer, and in the shadow, he saw the round buttocks of what he supposed to be the coveted fat calf. Quietly he slipped up behind it, and rose on his hind feet to seize it, when suddenly a pair of heels flew up from the ground. One of these hit Bruin directly under the chin, breaking his jaw and teeth, and causing him to see 1,500,000 more stars than were at that moment visible in the heavens; the other broke his right foreleg. The patient burro then laid back his ears, and proceeded to further maltreat the unfortunate and astonished bear, and with so much energy did he carry on the assault that in a short time the wretched beast was chewed and kicked into those ursine happy hunting grounds, where, it is to be presumed, the jackass brays not and his long ears are never seen. The bear being dead, the burro went back to the stacks, and, as he munched Mr. Black's hay, meditated on the mutability of affairs upon this mundane sphere, and especially on the uncertainty of life.

The sun rose bright and clear over Bull Creek next morning, and shone upon two individuals who left their respective dwellings at about the same hour. They were Mr. Black, who wished to inspect his cattle, and Mr. Opie, who was anxious to find his jack. In due course they met at Mr. Black's corral. There lay the King of the Mountains dead; there stood the somewhat scratched and torn burro, revolving many things in his mind, and still eating the hay. There could be no question as to what had taken place. The modest and shrinking ass had, single-handed, slain the terror of the district. As was most natural, Mr. Opie forthwith made a demand upon Mr. Black for the \$50 reward, which the latter declined to pay until the owner of the jack should produce a power of attorney or assignment to him of the donkey's claim, and more than this, Mr. Black then and there handed to Mr. Opie a bill for \$25 damages to corral and value of hay eaten. When the owner of the jack received this document, you might have knocked him down with a feather, he was so overwhelmed at the brazen audacity of the claim. He vowed that there was neither faith, truth, nor gratitude in V- Black, and hurrying to town, proceeded to bring suit against him for the full amount of the reward. His complaint set forth the facts of the offering of the reward, the killing of the bear, and the further fact that the jackass is his lawful property, and therefore he prays judgment in his favor for \$50 and costs of suit. Mr. Black, in his answer admits the allegations of the complaint, but avers that the reward was offered to any person killing the bear; that the jack is not a person within the meaning of the statute, and that if he were Mr. Opie is not his legal guardian, and in default of a power of attorney or any assignment is not entitled to sue for the recovery of his claim. He further alleges that Mr. Opie, owing the burro, is responsible for the damage done to his corral. Wherefore he prays judgment in his favor for \$25 and his costs in the action.

We are bound to confess that, while our sympathies are wholly with Mr. Opie, we think it extremely doubtful if he can recover the reward for which he sues. Even the lay mind may spy one fatal defect in his complaint, which will, we fear, render his suit hopeless, unless he obtains leave to amend. The complaint should have averred that the jack was a trained animal, and had been taught to kill bears, and that on the particular evening of the slaughter, his owner had said to him "Jack, there will very likely be a bear at Black's corral to-night, just go up and kill him for me"; that pursuant to these directions, the jack had gone to the corral; that the fence had been torn down by the bear, and not by the burro, and that for the value of the hay eaten, he was willing to pay. We opine that had the complaint been framed so as to include these allegations, Mr. Opie would have had a fair chance of success. The court would no doubt hold that should a man send out his hound to catch a fox, and the capture be made, the dog's owner would be the slayer of the animal, and, if a reward had been offered for its capture by any person, no assignment or power of attorney would be required from the bound, any more than one would be asked for from the gun had the animal been shot. So, if a sheep stealer were to send his collic to cut out a hundred animals from a bunch belonging to another, even though the dog's owner did not appear on the scene at all, he would be the thief. Clearly if Mr. Opie had put his jack on the trail of the bear, had followed him with cheers and shouts of encouragement, and been in at the

death, the killing would have been his act and deed. But it is not stated in the complaint that anything of this kind took place. So far as appears, the jack killed the bear of his own motion, and for his own pleasure and satisfaction, just as a greyhound might start out and kill a hare for its amusement, or a setter dog catch a woodcock or a quail. Hence we consider Mr. Opie's case weak.

Another point, hardly less interesting, arises. To whom does the slain bear belong? Evidently the game has been reduced to possession, and by the burro; yet it cannot be his, because the law of the land does not recognize the right of a dumb animal to hold personal—or, for the matter of that, real—property. It does not belong to Mr. Black—although captured on his land—for he had nothing to do with the killing; nor to Mr. Opie—though his burro killed it—for it does not appear that the latter was ordered to catch it, nor was Opie in pursuit at the time. There is a vast opportunity for argument opened up by the present case, and it is a question that we must really turn over to our legal and judicial readers to work out. It is certainly to be hoped that the points at issue may be carried up to the highest courts for settlement, in order that the rights of men who own jackasses accustomed to kill grizzly bears may in future be properly protected.

#### TRAP-SHOOTING PIGEONS.

PUBLIC attention in this country and abroad has of late been directed more than ever before to the subject of the trap-shooting of pigeons. The practice has been brought to popular notice by the large tournaments, particularly such as have been held in the vicinity of cities where the public press has commented upon them, and by certain bills to prohibit trap-shooting, introduced into the legislative assemblies. In several States these bills have become law.

We are not among the alarmists who frantically declaim that these various anti-trap-shooting movements are portentous of nothing less than the downfall of the American republic and the total eclipse in darkest gloom of all our modern civilization. We have faith to believe that our free institutions would survive the shock. Nor do we see in the proposals to abolish pigeon shooting a menace to field sportsmanship; to see construct them is to find an interpretation wholly untenable. Shooting a bird sprung from the trap and shooting a bird flushed in the field are two distinct things, the difference between which is recognized by the public and by sportsmen. Among the latter there is a very wide divergence of opinion respecting the merits of the trap-shooting of pigeons; many who are most enthusiastic in praise and practice of field shooting do not approve of pigeon trap-shooting as it is generally conducted.

This simple fact that the opponents of pigeon shooting are found largely among the rank and file of the great army of field sportsmen, is sufficient to prove how absurd is the silly cry of alarm that efforts to suppress pigeon shooting are covert movements directed against all shooting. If those who follow the practice of pigeon shooting wish to hold their ground against the repeated attacks of a growing public sentiment, it is nothing less than sheer folly to misjudge and misrepresent the true nature of that sentiment. Instead of mistaking it for something which it is not, the wiser course would be to determine exactly what this feeling is and the grounds upon which it is based. These cannot be removed by boisterous buncombe of defiance; but the opposition may be allayed by freeing trap-shooting from the cruel practices which often attend it. These are by no means so common nor so numerous as they have been in the past; there has been a change for the better. The barbarous maiming of the birds, which was the chief disgrace of pigeon shooting, is now, so far as we know, approved by no respectable club, whereas formerly much of it passed as reputable and proper. This particular form of cruelty, such as there is left of it, is most often the act of the handler, done without the intention or knowledge of the shooter. In fact, as at present conducted, the trap-shooting of pigeons is attended with far less actual physical suffering of wounded birds than is ordinary field-shooting. How then is the opposition to it to be explained?

POISON IN CANNED GOODS.—Considerable space in the daily press has been devoted recently to the question as to whether canned goods are, or are not, wholesome. Those who believe that they are not assert that the acids in the organic matter contained in the cans acts upon the tin, decomposing it and forming a violent, irritant poison. On the other hand, attention is called to the vast amount of canned goods annually consumed, and the fact that few or no deaths can be traced to this cause. One side shows analyses of canned goods which are evidently poisonous, and the other denies the correctness of such analyses. So the battle rages, now backward, now forward. We shall watch with interest the outcome of the dispute. Canned goods form so important a part of most camping and yachting stores, that it is in the highest degree essential that we should know all about them.

OUR READERS will confer a favor by sending us the names of such of their friends as are not now among the subscribers of the FOREST AND STREAM, but who would presumably be interested in the paper.

## The Sportsman Tourist.

### THE LOVE OF NATURE.

AN ACROSTIC.

CHIMEFEST amid earth's manifold delights,  
Hid though it be from the unwary eye,  
Ever ennobling as its joy incites,  
Sweet peace bestowing from the earth and sky:  
The love of Nature hath an influence holy—  
Never denied e'en unto the lowly—  
Usurping not, save baser passion's seat,  
Teaching all hearts with kinder life to beat.

Heaven sends a calm into the troubled heart—  
Into its depths a blessed peace descends,  
Like dew upon the bud that meekly bends—  
Like midnight silence in the middy mart.

Retire unto the woodland or the shore—  
Each wave a symbol of our earthly life!  
Seek friend in bird or bee, communion more  
Exalting than our worst strife:  
Repose upon the hillside, 'neath the pine;  
Voices shall soothe thee—aye, a voice divine,  
O earth-weary soul, shall whisper "Peace!"  
Into thy heart, dispelling every care—  
Rest Nature gives, for God is there.

O. W. R.

### NIMROD IN THE NORTH.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

#### VI.—Dogs and Dog-Sledging—Part Two.

A TEAM of dogs means anything from a couple up to as many as can be hitched to a sledge, seal, walrus or carcass of a musk ox, polar bear or reindeer, according to what is to be dragged, for on the hard, marble-like snows of the Arctic winter, any animal with its hair on makes a good enough sled of its own when dragged head foremost, to dispense with that vehicle except for long distances. The manner of hitching these teams varies considerably with the country. In Siberia, the Hudson Bay country and Alaska, they are placed one after the other in double or single files as shown in Figs. 1 and 2. In North Hudson's Bay and the

Arctic Ocean around King William's Land where my travels were cast, I found the dogs hitched with traces of unequal length so as to make a V, the point forward, as shown in Fig. 3, the angle of the V being filled with dogs also. In

Greenland I understand that the harness traces are of equal length and the dogs therefore spread out fan-shape as in Fig. 4. The dog at the point of the V is called the leader

and is generally the most intelligent of the gang, although not necessarily the strongest and the best. It is only necessary that he or she should understand the tones of the voice of the driver as to when he wants to go to the right or to the left, when he wants to halt, go ahead, fast or slow; as all the dogs are regulated by the movements of the leader, and he or she is solely regulated by the driver's voice, sometimes assisted by gently striking the snow near its right or left side to emphasize certain commands.

These vocal commands of the Hudson Bay dog-drivers are the most fearful gibberish and tongue-twisting articulations I have ever heard, and although some Arctic writers have essayed to imitate it in English orthography, I will not attempt it, for I would just as soon try to give my readers the sound of thunder, a hen's cackling, or a wagon on a corduroy road by notes of music as to attempt this. I have never seen a white man that could imitate them well enough so far that the dogs would understand it, and therefore hardly think it right to essay it so that my readers could. One or two of them are simple enough, however, as our whoa-a! long drawn out, means, steady! as you are! or a sort of sign of vocal encouragements and sounds funny enough at first when you hear it, to see the dogs go right on as if nothing had been said at all. In ordinary tradings a leader is considered to be worth two common dogs, and if he or she be of unusual intelligence, three.

I have already spoken of the feed used in the Arctic for their dogs, in describing walrus hide (*kora*) and kelp fish that are caught in the natural fish traps by the rise and fall of the tide. Should the carcass of a flensed whale—or one that has had its blubber stripped from it by the whalers—be cast ashore near their village, the dogs will belucky, indeed, for if it be only of fair size there will always be enough dog food for several months at command. The natives say that when pressed with hunger in the summer months the dogs will devour large quantities of mud from the shores of the fresh water lakes, and thus manage to prevent starvation until something eatable turns up. Early in the spring—that is early for their climate, say June—when the young reindeer fawns are not strong enough for a long run, it is not an uncommon occurrence for a hunting dog to disappear from camp in a thickly supplied reindeer country and to be gone for several days, subsisting off of the young fawns. Paresmeut, a splendid, swift hunting dog of ours, disappeared at one time from us just before we moved to King William's Land, and coming back on th

fourth day, looked as if he had swallowed a keg. The natives always dislike to feed them heartily just before a day's work, for then they are the very laziest creatures on top of earth, and require double the amount of usual whipping to get any work out of them.

The whip is just the length of the longest harness trace, so as to just touch the leader, although I should add that he is whipped less than any other dog in the team. The whip is a single long, supple lash of tanned seal (*ook-jook*) skin with a very short handle, like that on the western "black-snake" whip. They are the best trained men with a whip I have ever seen, and can single out a solitary dog in a perfect moving compact mass of them, and cut him with the lash on any particular ear that they desire. From children up they are constantly using this instrument, and thereby acquire a versatility with it that no white man can ever equal. In some parts of the Arctic the whip is unknown, and the dogs are driven by a small, stout stick, held in the hand when not used, and hurled at any refractory or lazy dog in the team when needed. As the sledge goes by the active driver resumes it to repeat the operation when needed.

It would be useless, I think, to describe the many varieties of sledges to be found in the whole extent of the Arctic, for they vary with nearly every tribe, but I shall confine myself to those few kinds that came under my personal observation. The most primitive and simple sledge of all is one hewed directly out of the ice—bed and runners. One would think this vehicle extremely fragile, and liable to go to pieces at any moment; but so long as the owner keeps along the level shore ice, its extreme "corpulent" and strong construction renders it a rather serviceable conveyance; besides, it has the advantage of always having ice on the bottoms of its runners, a most necessary adjunct to the sledges of this region of the world. A sledge with ice spread evenly and smoothly over the bone shoe of a sledge can be hauled over the hard snow-drifts of an Arctic winter with ease, and the dogs it would otherwise take and nothing in the world makes the native sledgeman so angry as to strike his runner against a half-concealed stone and strip the beautiful ice-shoe from his sledge.

And now let me describe this "icing" the runners of a sledge briefly, and speak of its great benefits. When a sledge is being built, the last thing to do, if the builder has the material, is to shoe it with a batten-like strip of bone, taken from the jaw of a whale, and which, being a little wider than the runner, projects over on both sides, as shown in cross section in Fig. A. Lashings of whalebone or large

wood screws enable them to be fastened securely, and this bone shoe is generally rounded off a trifle on its bearing surface or under side. To "ice" the sledge, it is turned bottom up, and the first coat of snow is laid. This consists of pieces of snow about as big as one's double fist dipped in water to render it slushy and soft, and the native with the open palm of his hand applies it to the runner, rubbing it backward and forward until it forms a level, smooth, and solidly frozen surface of about two feet along the runner and crimps over and binds on the projecting flanges of the bone shoe, as shown in cross section in Fig. B. This, of course, is continued the

A

whole length of the runner. This frozen snow is opaque and looks like a mass of ground glass, and when solidly frozen, as it will be even while the man is rubbing it, the process is ready for the second coat or finishing touches, so to speak.

The live now takes his mouth as full of water as it will hold, and sends a gentle spray over the frozen snow on the runners, and this freezes almost as fast as it strikes, the sledgeman at the same time rapidly running the palm of his hand backward and forward over the surface to give it a perfect polish. Sometimes he uses a piece of bear skin to save his hand the severe friction, but the last few strokes are always with the open palm of the hand.

This finished sledge is ready for use as slippery as one can possibly imagine, and truly I do not think I exaggerate the comparison when I say that it is as much easier to pull a sledge nicely and properly iced over one that is not, as it would be for a horse to pull a truck with the wheels on over one that had them taken off. My largest sledge was one so heavy that it was hard work for any of us men to turn it over so that Tooolooch could ice it, and it would have taken a couple and probably three to sledge it if the runners were uniced, yet when the icing had been completed, I could take my little finger (and often have done it,) hooked on one of the cross slats, and work this ponderous vehicle backward and forward through the distance I could swing my arm. Several times, without noticing that the snow was a little bit unlevel, we have turned the iced sledge over gently to prevent fracturing the glacial shoe, and have been surprised to see it start down the grade by its own portage connecting two lakes or over the top of a ridge where the snow has nearly blown away without stripping thence from his sledgemen runners against the many stones that are peeping through the snow in every direction. I have seen by my best sledge driver, Tooolooch, take his twenty foot sledge through a place for a couple of hundred yards where it would seem impossible to spread one's coat without covering a stone, and yet come out scathed, but it is required the work of a Hercules to bring the front of the sledge from the side of a lake and watching the rear that it was not thrown against or over a rock. So important is it to keep this icing on the sledge-runner bottoms, that if it is ripped off by any accident the Esquimaux will stop at the first lake or river where they can get water to wet the snow and sprinkle the second coating, though they may have to dig through seven or eight feet of ice to get it.

When one reflects upon the value of this simple accessory

to Arctic sledging, and of the importance of sledging to an expedition that desires to accomplish anything in these regions, and also that this art is solely monopolized by these people, it at once shows the great advantage of having them as allies and the comparative folly of sledge journeys in rough Arctic countries without them. If a rough, stony place interposes itself where the projecting rocks are so numerous that it really becomes impossible to get through, all the persons in the party will take off their reindeer coats and spread their hair side up over the stones that the runner would strike in passing by. Late in the spring, when the temperature commences to approach freezing from a much lower standard, the ice will not retain its hold so well on the bone shoes, and when it reaches melting extra precautions have to be taken to protect it. Halting to rest on a warm, sunny day, the sledge is swung around so that one runner is protected by its own shadow, while the other has a number of reindeer cloaks, blankets or anything that nature spreads over it to keep the sun off. The least little bump at these temperatures is very liable to knock off a foot or two, and then the rest is easily sealed off. When it becomes so warm that the ice will no longer retain its hold, the snow on which the sledge runs becomes of a soft consistency that allows the bare bone shoes of the runners to glide over it with comparative ease, and everybody now wants to ride on the sledge, as when walking they are sinking up to the ankles or knees in the half-slushy snow.

The worst experience I ever had in sledging was on Back's River in December, 1879. This stream is full of rapids which keep open the whole winter, and the rising steam from them (for they look like huge boiling cauldrons of water in the intense cold of winter) freezes into a fine, gritty, sand-like mass of snow that covers the true snow-drifts with a mass like so much rosin, and that sticks to the sledges runners with almost as much persistency in any temperature below -50° F., and I think the thermometer averaged lower than that while we were on the river. But even this was not the worst obstacle, for all the snow that had lodged on the river ice was along the cracks in the ice, nearly all of which seemed to be perpendicular to the axis of the stream. We thus had an alternation of snow and ice every few yards, and often every few feet. The ice from the river would strip that from the sledge, and the runner would be reached the party to drag it over. Either ice or snow alone would have allowed us to proceed at a good round gait, but their alternating condition made it the most annoying and laborious work I have ever experienced, and we always felt lucky if the igloos in the morning's camp were out of sight around some bend of the river when we picked out our camp for the evening. At the very first favorable opportunity to leave the river and found the high country between it and Hudson's Bay much better adapted for sledging than even its level bed.

While on the Koojmijook, a branch of the Great Fish River, during the spring so late that the ice would not stay on the runners, we found a great deal of the snow on the river ice mixed with sand, blown from the banks during high winds, and this acted like sandpaper on the bare bone shoes, and, as the sledgemen were not used to this, they would about half their usual thickness and felt a little bit uneasy that they might break under hard knocks, which they did do several times, but never enough to seriously compromise us.

In a great many parts of the Arctic it is impossible to procure the bone from a whale for sledge shoes, and then the wet snow is applied directly to the bottom of the runner, and before its application is mixed with boggy mud full of rot, sticks and other things, so that the snow, when it is its mixture when it can be obtained is the undigested mass taken from the stomach of a reindeer. Among the Netschilinks, who confine their sledging to the coasts of the Arctic Sea, where it is of the best character, and who kill no whales to furnish them with bone, we find the runners shod with pure ice. Trenches the length of the runners are dug in the ice, and into these the runners are lowered two or three inches, yet not touching the bottom, the snow being the same distance. Water is then poured and allowed to freeze, when the sledge is lifted out shod with a runner of perfectly pure and transparent ice. So transparent is this ice at times that when the sledge is in rapid motion it may produce a peculiar optical delusion, one imagining that the sledge is some three or four inches from the ground, swinging out behind like a kite's tail in its rapid flight. When not used for water, the ice is very hard, and has already explained is adopted or the skin of a polar bear or musk-ox may be used if it be dragged with the hair pointing backward.

The ratio of width to length in their sledges varies with the different tribes. The Hudson Bay Esquimaux use about the proportions usually seen in boys' sledges used for coasting, although five or six times as large. The Kianepetoo of Chesterfield Inlet, on the contrary, often have sledges of twenty-five to thirty feet in length and only a foot or foot and a half in width, claiming that these go over rough ground much easier than the common kind.

In putting a load on a sledge a pole at the height of a person's breast is often lashed on the fore end of the load so that it will project on both sides a couple of feet, and with a person on either side pushing on this, the sledge is easily controlled.

"How fast can a sledge go?" or "How far can you travel in a day with them?" is an indefinite question, asked nearly as often as the one about the size of the Esquimaux dog, and the reply is about as satisfactory when I say they can travel nearly as fast and fully as far as a horse. If the sledge has a maximum load (say 150 to 200 pounds per dog on salt water ice or half that on inland sledging) the party can make from ten to twenty miles a day, and keep it up about the same as a light expedition of troops. With a splendid team of ten to fifteen dogs, with only a driver and a light sledge, we could make seventy-five or even a hundred miles a day, especially along the coast. While in the heavy, hummocky ice of Victoria Channel, I only made ten miles, with a fair load, in fourteen hours' hard work; yet I have been told of an incident where life and death hung on the rapidity of action, and forty-five dogs were harnessed to a light sledge, with two pleasant men sitting on the team, and on each side, when twelve or thirteen miles were made in less than double as many minutes to rescue a lost sailor from the whaling ships in Repulse Bay.

PENNSYLVANIA.—Jefferson, Pa., May 7.—I have been spending the past week in the country, and by observation I find the quail have wintered well here. I took a stroll to the woodlands on the 4th inst., and in my rambles have seen several pairs, and the welcome notes of Bob White can be heard on all sides.—RAMBLER.

## QUIET SPORT.—III.

BY MILLARD.

EARLY on the morning of our third day at Spider Lake, Roy and Glen, with one of the guides, started for another lake about three miles northeast, intending to remain there a couple of days and then join us again. They carried blankets and edibles, and merrily took the trail.

Ward went back to his first principles of angling, and produced his bag of worms with the remark that now he stood upon his native soil and could tell when he had a fish properly hooked; and would discard the fly for the day, at least. He admired Green's style and its results, but he did not care to learn it too fast. "Go slow and learn to peddle," was his motto, and he would give the little tackle another trial on the morrow; so we will leave him at the lake and follow Dick down the outlet. It is a pretty stream, and as General Sherman said of the Rio Grande, so crooked that one cannot tell which side of it he is on. Every rod of it is lovely with its distinct and special characteristics, suggesting innumerable pictures to the artistic eye.

Varied as the tints and forms of the kaledoscope, at each turn it seemed as if some fantastic water sprite was transposing its look and character. Here its whole surface is flecked with ripples and foam, each ripple wearing a crown of diamonds and making music sweet as children's laughter. Away it skurries, fretting and chafing and bumping its head against boulders and fallen trees, scraping its sides on the banks until, seemingly exhausted with its headlong race, it quietly hugs the shore and in a deep and darksome pool, black as the ten of spades, which you remember is considerably blacker than the celebrated ace, it vividly reflects the far-reaching branches which over-arch it. And its journey, with its ripple and pool, never-failing springs adding their tribute to its volume. "There is melody in the fall of the cataract, and the rush of many waters is sweet to the senses," but "with all thy faults I love thee" quiet.

A few yards below an abatis of fallen trees was one of those quiet pools lying off the eddying waters, a resting place for such trout as were tired from battling with the strong current. They could just as easily drop into it, as a worried, travel-stained man would drop into a wayside inn and brace up a wee bit, for trout sometimes grow weary and take a rest.

There's a trout there this blessed moment, and perhaps he is having a sociable chat with the fellow who keeps the place. At any rate he has refused a variety of popular flies; and it is never advisable to waste one's time by too many casts over the same place and fly. He makes his too cautious of your intentions, but mark the sportsman's eye on unaccountably, and perhaps toward sunset, if you return, you may bring him to your creek. Possibly sundry pricks that he has received in the past are not forgotten, and the remembrance of them makes him the more wary; for like a skilful boxer or swordsman he is only biding his time and opportunity to seize a favorable opening when he can deliver his blow and escape the return; and in a careless moment, when Dick's leader is slack over the water, he stretches it to the breaking point, and then suddenly breaks it.

Dick gave utterance to a rather audible "Devil take my carteriness!" as he waded ashore to repair the damage, a mingled look of disgust and disappointment overshadowing the usual serenity of his face.

Some can find solace and comfort in familiar quotations for every disappointment and trouble. Others draw a temporary consolation from their flasks, and others have recourse to their tobacco pouches. Dick had no flask, and for getting any pleasure touching his present disaster, he turned with a sigh of regret to his briarwood, endeavoring to extinguish his disappointment by lighting his pipe, and adulterating the sweet scented air with the fumes of cut plug.

Fortune not only turned toward him the cold shoulder, but Justice raised the bandage from her eyes, surveyed the scene, gave a very expressive wink as she replaced the bandage and said, "Unpl! served you right, young man. Next time Miss Goodie Luck offers you her sunniest and sweetest favors, do not dally and trifle too long, else she may again change her mind. She is the most capricious of her sex."

By the time a new leader with its cast of flies had been adjusted and his pipe finished, Richard was himself again. What did the trifling mishap amount to? No more than the aching tooth of the old village doctor, the pulley when Dick was a rambunctious boy. Many a man of less than my temperament would have succumbed to despondency long enough to have reeled up and gone home. Dick appreciated the fact that there were as good fish in the sea as ever were caught, and unanimously passing a resolution to be more careful, he waded into the stream with a thickly settled determination that if it were possible to capture any fish he would make the possibility a certainty, and as they began to rise he was sure there he would get a big one. An absorbing pleasure that amply compensated him for his previous inattention. So eagerly did they rise among the ripples and the eddies in the pools and quiet reaches, coming from under banks and boulders after the enticing and swindling morsels, that they exhibited a selfishness of which a spoiled child would be ashamed.

It requires an almost fabulous amount of self-control and denial for an angler to reel up and go back to camp when a fish is in the biting humor. The creek may be filled, but the temptation for one more cast, and then another and another, is powerful, and the angler who can resist it is one in a score. The angler should scorn to fish for count, but so many of his angling days are so barren of results, and so comparatively disastrous, that he improves the opportunity when the fish won't let go. But he does it fairly, and every fish he creels is of use to him or his friends. The fingerlings he throws back to life and to wisdom; the old and large ones he does not waste. That was the class of anglers to which Dick belonged. He had enough when he could have had more; and then

The angler campward tramped his pleasant way.

Dick had hardly reached the shanty when Glen and Roy, with their guides, returned. They had caught what was very of the latter end of the morning fishing, but it had been barren of results. The fish they reported as more sordid than four dollar bills, and as they had none in the concrete, they were unable to make a dam of them. They would hardly explain the reason of their unexpected return, as they had announced their intention of remaining away a couple of days and had provisioned themselves accordingly; but as Roy and the guide had developed such extraordinary appetites that Glen had, as a matter of self-defense and vomitory protection to consume his share, which resulted in a complete annihilation of the commissariat attached to the expedition, and a speedy retreating of their steps was a matter of course. Supplies for two days were exhausted at one

meal and that only a lunch. Tarrare could hardly have surpassed it in any of his feats of gastronomy. They were hungry, too, when they reached the home camp. The guide said his stomach felt as if his throat were cut, and Roy and Glen responded, amen.

The complaint seemed contagious, for we all felt the insidious approaches of irresistible appetites, whose claims could not be ignored, and the cook was ordered to do his best; and no refinement of palate could be dispensed at the spread he offered, barring a few unimportant items. The bread, perhaps, was a trifle too stale, the biscuits might, for some have been rather too heavy; the potatoes might have been baked instead of having been boiled, but the coffee was clear, hot, strong and abundant. The trout came on piping hot. They had changed their spotted dresses of every day wear and for this occasion only appeared in close fitting dresses of golden brown, and they were just as nice as they looked, but their beauty could not protect them.

Then we gathered around that delight of a camper, a roaring fire, and the evening programme was carried out, while the laydays were having their little twilight discussions and the owls were trying to hoot the horns off the gibbons whom the man was away, and drowning out the faint murmuring of the lake and stream. It was an exquisite evening, full of the charms that belong only to forest and stream. A light wind came across the lake, rippling into silvery furrows, and passing on, whispered among the trees and hurried up the fire. Cracked voices struggled with throaty songs, while the old hills caught up the refrains, and doubling and trebling them, hurled them toward the settlement to annoy the good people there, if they were so unfortunate as to hear.

## Natural History.

### BIRDS OF NORTHERN OHIO.

BY SEYM. R. INGERSOLL.

[The nomenclature employed is that of the Smithsonian catalogue.]

**WOOD THRUSH**—*Turdus mustelinus*.—A common summer resident; breeds. Arrives about April 22. Wilson's Thrush—*Turdus fuscescens*.—A summer resident; breeds. Arrives about the 1st of May. Olive-backed Thrush—*Turdus searsianus*.—Found during spring and fall migration.

Hermit Thrush—*Turdus pallasi*.—Not a common summer resident; breeds. Arrives about the middle of April. Robin—*Erithacus rubecula*.—An abundant summer resident; breeds. Arrives along the last of February.

Mockingbird—*Mimus polyglottus*.—Rare summer resident. Catbird—*Merula carolinensis*.—An abundant summer resident; breeds. Arrives about the last of April.

Brown Thrush—*Harporhynchus rufus*.—A very common summer resident; breeds. Arrives about the middle of April.

Bluebird—*Sialia sialis*.—An abundant summer resident; breeds. Arrives along the last of February.

Blue-gray Gnatcatcher—*Poliptila caerulea*.—A common summer resident; breeds. Arrives about the middle of April.

Ruby-crowned Kinglet—*Regulus calendula*.—Quite common during spring and fall migration.

Golden-crowned Kinglet—*Regulus satrapa*.—A common winter visitor.

Tufted Titmouse—*Lophophanes bicolor*.—In some parts a common resident; breeds.

Black-capped Chickadee—*Parus atricapillus*.—A common winter visitor; a few remain and breed.

White-bellied Nuthatch—*Sitta carolinensis*.—A common resident; breeds.

Red-bellied Nuthatch—*Sitta canadensis*.—An irregular winter visitor.

Brown Creeper—*Certhia familiaris*.—A common resident; breeds.

House Wren—*Troglodytes domesticus*.—A common summer resident; breeds. Arrives about the middle of April.

Winter Wren—*Anthus troglodytes*, var. *hyemalis*.—A not common winter visitor.

Long-billed Marsh Wren—*Triturus palustris*.—Common in some localities; a summer resident; breeds.

Short-billed Marsh Wren—*Cistothorus alularis*.—A not common summer resident; breeds. Arrives about the 1st of May.

Brown Lark, Titlark—*Anthus ludoviciana*.—Found during spring and fall migration.

Black and White Creeper—*Mniotilta varia*.—Common during spring and fall migration; a few remain and breed.

Worm-eating Warbler—*Helminthophaga cernitorius*.—Found during spring and fall migration.

Blue-winged Yellow Warbler—*Helminthophaga pinus*.—Common during migration; few remain and breed.

Blue Golden-winged Warbler—*Helminthophaga chrysoparia*.—Not common during migration.

Nashville Warbler—*Helminthophaga ruficapilla*.—Common during spring and fall migration.

Orange-crowned Warbler—*Helminthophaga celata*.—Rare.

Blue Yellow-backed Warbler—*Parula americana*.—Found during spring and fall migration.

Cape May Warbler—*Dendroica tigrina*.—Not common during migration; more abundant in the fall.

Yellow Warbler—*Dendroica aestiva*.—A common summer resident; breeds. Arrives about the last of April.

Black-throated Blue Warbler—*Dendroica cerulea*.—An abundant spring and fall migrant.

Yellow-rumped Warbler—*Dendroica coronata*.—Common during spring and fall migration.

Black and Yellow Warbler—*Dendroica maculosa*.—An abundant spring and fall migrant; few remain and breed.

Cerulean Warbler—*Dendroica cerulea*.—Found during the spring and fall migration; few breed.

Chestnut-sided Warbler—*Dendroica pensilvanica*.—Quite a common spring and fall migrant.

Gray-breasted Warbler—*Dendroica castanea*.—Found during spring and fall migration; more abundant in the fall.

Black-poll Warbler—*Dendroica striata*.—Migrant; irregular in the spring but common in the fall.

Blackburnian Warbler—*Dendroica blackburniae*.—Not common spring and fall migrant.

Black-throated Green Warbler—*Dendroica virens*.—Quite common during spring and fall migration.

Kirtland's Warbler—*Dendroica kirtlandi*.—Very rare; only four or five have been found.

Pine-creeping Warbler—*Dendroica pinus*.—Not common spring and fall migrant.

Yellow Red-poll Warbler—*Dendroica palmarum*.—Found during spring and fall migration.

Patrie Warbler—*Dendroica discolor*.—Rare migrant.

Golden-crowned Thrush—*Sturnus auricapillus*.—Not uncommon summer resident; breeds. Arrives about the 1st of May.

Large-billed Water Thrush—*Sturnus notabilis*.—A summer resident in some localities; breeds. Arrives about the 1st of June.

Green Black-capped Flycatching Warbler—*Myiodynastes pusillus*.—Occasionally found during spring and fall migration.

Kentucky Warbler—*Oporornis formosus*.—Few seen during migration; said to occasionally breed in some localities.

Mourning Warbler—*Geothlypis philadelphia*.—Rather rare spring and fall migrant.

Maryland Yellow-throat—*Geothlypis trichas*.—A common summer resident; breeds. Arrives about the 1st of May.

Golden-breasted Chat—*Icteria virens*.—Common summer resident; breeds. Arrives about the 1st of May.

Hooded Warbler—*Myiodynastes virens*.—Common spring and fall migrant; few remain and breed.

Canada Flycatching Warbler—*Myiodynastes canadensis*.—A common migrant; more abundant in the spring.

Redstart—*Setophaga ruticilla*.—A common summer resident; breeds. Arrives about the last of April.

Red-eyed Vireo—*Vireo olivaceus*.—Common summer resident; breeds. Arrives about the 1st of May.

Philadelphia Vireo—*Vireo philadelphicus*.—Not common spring and fall migrant.

Warbling Vireo—*Vireo gilvus*.—A common summer resident; breeds. Arrives about the 1st of May.

Yellow-throated Vireo—*Vireo flavifrons*.—Common during spring and fall migration; few remain and breed.

Solitary Vireo—*Vireo solitarius*.—Found during migration; few remain all summer and breed.

White-eyed Vireo—*Vireo noroncoracensis*.—Not common summer resident; breeds. Arrives about the middle of April.

Great Northern Shrike, Butcher-bird—*Lanius borealis*.—An irregular and not common winter visitor.

Loggerhead Shrike—*Lanius ludovicianus*.—Not uncommon summer resident; breeds. Arrives about the middle of May.

Bohemian Waxwing—*Ampelis garrulus*.—Rare winter visitor.

Carolina Waxwing—*Ampelis cedrorum*.—A common resident; breeds.

Purple Martin—*Progne subis*.—Summer resident; breeds. Arrives about the last of April.

Cliff Swallow, House Swallow—*Petrochelidon lunifrons*.—A very common summer resident; breeds. Arrives about the 1st of May.

Barn Swallow—*Hirundo erythrogastra*.—An abundant summer resident; breeds. Arrives about the 1st of May.

White-bellied Swallow—*Tachycineta bicolor*.—In some localities a common summer resident; breeds. Arrives about the 1st of April.

Bank Swallow, Sand Martin—*Oedipus riparia*.—A rather common summer resident; breeds. Arrives about the last of April.

Rough-winged Swallow—*Stelgidopteryx serripennis*.—In some localities a common summer resident; breeds.

Scarlet Tanager—*Pyranga rubra*.—Not abundant summer resident; breeds. Arrives about the 1st of May.

Tree Grosbeak—*Picoides lineator*.—An occasional winter visitor.

Purple Finch—*Carduelis purpureus*.—Found during spring and fall migration.

Common Crossbill—*Loxia curvirostris*, var. *americana*.—An irregular winter visitor.

White-winged Crossbill—*Loxia leucoptera*.—An occasional winter visitor.

Redpoll Linnet—*Regulus linaria*.—Not common winter visitor.

American Goldfinch, Yellowbird—*Astragalinus tristis*.—An abundant resident; less common in the winter; breeds.

Pine Linnet—*Chrysomitris pinus*.—A common winter visitor.

Snow Bunting—*Plectrophenax nivalis*.—Not common winter visitor.

Longspur—*Centropus lapponicus*.—An occasional winter visitor.

Savannah Sparrow—*Passerculus savanna*.—Common in some localities during migration; few remain and build.

Bay-winged Bunting, Grass Finch—*Pooecetes gramineus*.—An abundant summer resident; breeds. Arrives about April 1st.

Yellow-winged Sparrow—*Carpodacus passerinus*.—Not common summer resident; breeds. Arrives about May 1st.

Lark Finch—*Chondestes grammacus*.—Not uncommon summer resident; thought by some to breed here.

White-crowned Sparrow—*Zonotrichia leucophrys*.—Quite common during spring and fall migration.

White-throated Sparrow—*Zonotrichia albicollis*.—A common spring and fall migrant; few breed.

Tree sparrow—*Spizella monticola*.—An abundant winter resident.

English Sparrow—*Passer domesticus*.—An abundant resident in the cities and towns; breeds.

Chipping Sparrow—*Spizella socialis*.—An abundant summer resident; breeds. Arrives about the first of April.

Field Sparrow—*Spizella pusilla*.—A common summer resident; breeds. Arrives about the middle of April.

Song Sparrow—*Melospiza melodia*.—An abundant summer resident; breeds. Arrives about the first of March.

Swamp Sparrow—*Melospiza palustris*.—In some localities a summer resident; breeds.

Fox Sparrow—*Passercilla iliaca*.—Found during the spring and fall migration.

Cheviuk, Towhee, Bunting—*Pipilo erythrophthalmus*.—A common summer resident; breeds. Arrives about the first of April.

Cardinal Grosbeak—*Cardinalis virginiana*.—An occasional winter visitor.

Rose-breasted Grosbeak—*Goniphaga ludoviciana*.—Not common; summer resident; breeds.

Indigo Bunting—*Cynoscopia cyanea*.—A common summer resident; breeds. Arrives about the middle of May.

Bobolink—*Dolichonyx oryzivorus*.—Summer resident; breeds. Arrives about the middle of May.

Red-winged Blackbird—*Agelaius phoeniceus*.—An abundant summer resident; breeds. Arrives about the middle of April.

Red-winged Blackbird—*Agelaius phoeniceus*.—An abundant summer resident; breeds. Arrives about March 1st.

Meadow Lark—*Sturnella magna*.—An abundant summer resident; breeds. Arrives about the middle of March.

Orchard Oriole—*Icterus spurius*.—Common summer resident; breeds. Arrives about the first of May.

House Oriole—*Icterus bulgaricus*.—Quite a common summer resident; breeds. Arrives about the last of April.

Rusty Blackbird—*Scolecophagus ferrugineus*.—Common during spring and fall migrations.

Purple Grackle, Crow Blackbird—*Quiscalus purpureus*.—An abundant summer resident; breeds. Arrives about the first of March.

Common Crow—*Corvus americanus*.—Common summer resident; breeds. Arrives about the last of February.

Blue Jay—*Cyanurus cristatus*.—An abundant resident; breeds.

Shore Lark, Horned Lark—*Eremophila alpestris*.—A common winter visitor; few breed.

Kingbird—*Tyrannus carolinensis*.—A quite common summer resident; breeds. Arrives about the first of May.

Great Crested Flycatcher—*Myiarchus cinerascens*.—A common summer resident; breeds. Arrives about the middle of May.

Pewee—*Sayornis fuscus*.—A common summer resident; breeds. Arrives about the last of March.

Wood Pewee—*Contopus virens*.—A quite common summer resident; breeds. Arrives about the middle of April.

Acanthid Flycatcher—*Empidonax aedon*.—A common summer resident; breeds. Arrives about the middle of May.

Trail's Flycatcher—*Empidonax traillii*.—Found during spring and fall migration; not common.

Least Flycatcher—*Empidonax minimus*.—Common during spring and fall migration.

Ruby-throated Hummingbird—*Trochilus colubris*.—A very common summer resident; breeds. Arrives about May 9.

Chimney Swift—*Chaetura pelagica*.—Quite a common summer resident; breeds. Arrives about the middle of May.

Whip-poor-will, Night Jar—*Antrostomus vociferans*.—A summer resident; breeds. Arrives about the first of May.

Night Hawk—*Chordeiles virginiana*.—Common summer resident; breeds. Arrives about the first of May.

Hairy Woodpecker—*Picus villosus*.—Common summer resident; breeds.

Dowry Woodpecker—*Picus pubescens*.—Common resident; breeds; more abundant in the fall and winter.

Yellow-bellied Woodpecker—*Sphyrapicus varius*.—Common during spring and fall migration in some localities.

Pileated Woodpecker—*Hylocichla pileatus*.—Few still to be found in some localities; breeds.

Red-bellied Woodpecker—*Centurus carolinus*.—Not common resident; breeds; more abundant in the winter.

Red-headed Woodpecker—*Melanerpes erythrocephalus*.—A common summer resident; breeds. Arrives about April 1.

Yellow-shafted Flicker—*Colaptes auratus*.—An abundant summer resident; breeds; a few remain all winter.

Belted Kingfisher—*Ceryle alcyon*.—A common summer resident; breeds. Arrives about the first of April.

Yellow-billed Cuckoo—*Coccyus erythrophthalmus*.—Summer resident; breeds. Arrives about the middle of May.

Black-billed Cuckoo—*Coccyus erythrophthalmus*.—Quite a common summer resident; breeds. Arrives about the middle of May.

Long-eared Owl—*Otus vulgaris*.—Resident; common in winter, rare in summer; breeds.

Short-eared Owl—*Brachyotus palustris*.—A common resident; more abundant in the winter; breeds.

Barn Owl—*Syrnium nebulosum*.—Resident; more abundant in the winter; breeds.

Acanthid Owl—*Nyctale acadica*.—Not uncommon; resident; breeds.

Screech Owl, Mottled Owl—*Scops asio*.—A common resident, but much more common during the winter; breeds.

Snowy Owl—*Nyctale scandiaca*.—An irregular winter visitor.

Hawk—*Falco communis*, var. *anatum*.—Found during spring and fall migration; not common.

Pigeon Hawk—*Falco columbarius*.—A common migrant; few remain and breed.

Sparrow Hawk—*Falco sparverius*.—A common summer resident; breeds. Arrives about the 1st of April.

Sharp-shinned Hawk—*Falco harrisi*.—A summer resident in some localities; breeds.

Marsh Hawk—*Circus cyaneus*, var. *hudsonius*.—In some localities a common resident; breeds.

Cooper's Hawk—*Accipiter cooperi*.—A common resident; breeds.

Sharp-shinned Hawk—*Accipiter fuscus*.—A common resident; breeds.

Belted Hawk, Hen Hawk—*Buteo aquilinus*.—A common resident; more abundant in the winter; breeds.

Red-shouldered Hawk—*Buteo lineatus*.—A common resident; breeds.

Broad-winged Hawk—*Buteo pennsylvanicus*.—Not common resident; more abundant in the winter.

White-headed Eagle, Bald Eagle—*Haliaeetus leucocephalus*.—A few seen during migration; breed in some localities.

Tukey Buzzard—*Cathartes aura*.—A common summer resident in some localities; breeds.

Passenger Pigeon, Wild Pigeon—*Ectopistes macrura*.—A spring and fall migrant.

Carolina Dove, Mourning Dove—*Zenaidura macroura*.—A common summer resident; breeds. Arrives about the last of April.

Ruffed Grouse—*Bonasa umbellus*.—Resident in some localities; breeds.

Virginia Partridge, Quail—*Ortyx virginianus*.—A common resident in some localities; breeds.

Great Blue Heron—*Ardea herodias*.—In some localities a common summer resident; breeds.

Great White Egret, White Heron—*Ardea cygnetus*.—Summer resident in some parts; breeds.

Green Heron—*Ardea virescens*.—A common summer resident; breeds. Arrives about the middle of April.

American Bittern—*Botaurus minor*.—Summer resident in some localities; breeds.

Least Bittern—*Ardeola exilis*.—Not uncommon summer resident; breeds.

Turnstone—*Streptopelia interpres*.—A few have been taken along the lake during spring and fall migration.

Black-bellied Plover—*Spatula helvetica*.—A few found during spring and fall migration.

Golden Plover—*Charadrius fuscus*, var. *virginicus*.—Not uncommon during spring and fall migration.

Killdeer Plover—*Argemone vociferans*.—A common summer resident; breeds. Arrives about the 1st of March.

Semipalmated Plover—*Argemone semipalmata*.—Not common migrant; more abundant in the fall.

Piping Plover, Ringneck—*Argemone melodia*.—Rather common spring and fall migrant; breeds in some parts.

degrees below the truth. Perhaps by the time that he is old enough to come out of the ranks of "younger riflemen," he will have learned that no experienced still-hunter uses gloves, but heavy y.a.n mittens, knit so large that they can be removed instantly.

"O. H. I." states that he has only used the '73 model Winchester, and the Marlin, 40 cal. Where does he get his authority for this statement? If from me, then I have been guilty of a gross falsehood, for I have used the Spencer, Sharps, Evans, Wesson and Ballard, and in giving preference to the Marlin for forest shooting, I did not take single breech-loaders into account, as the rapidity with which the repeaters can be discharged, overshadows the greater force of the best single shot Rifle; but on the plains it is a strong point in their favor. In his statement that no hunter of solid experience would take either a Marlin or Winchester deer hunting, if he could get any other, he condemns "at one fell swoop" the thousands of hunters with these arms in their hands, from Maine to California, many of whom have passed the most of their lives in the pursuit of large game. Either his experience has been much greater than he claims, or he has forgotten the caution in criticism which he recommends to me.

Next he says that there are rifles which will bring a deer down, no matter where you hit him, and in the next breath declares that he has seen deer literally shot to pieces which afterwards had to be run down. What must be the condition of those which are brought down instantly? This statement that single-loaders never shoot except from the muzzle, may do for those who have never seen them burst at the breech; but not for me. His reasons for the high trajectory of the Winchester, after loftily setting aside my statement, are enumerated by him, that he has given me the light, bullet and large caliber. If he will kindly explain how he gets the former to hit the latter without having it "short in proportion to its diameter," which is exactly my statement, he will solve a profound conundrum. The shooter barrel and lighter powder charge do not exist in the 60 gr. Winchester which has also a high trajectory. His reasons for the superiority of the Marlin are, to all intents, the same as the points alluded to in my letter to the W. R. A. Co. His advice for me to read the Winchester's still list, in order to learn the effects of rifle bullets on deer, is good. I expect that some one will next recommend me to read Mr. Steele's "Paddle and Portage" for information in regard to the game resorts of Northern Maine.

PENOBSCOT.

# JOTTINGS FROM JERSEY.

I HAVE a good excuse for my long silence. I might, of course, plead the close season and no game news, but as Essex county is in this State, and there they kill woodcock on the nest in April, that would not do. To tell the truth about it, I have had the "heart taken out of me." This winter my friend McConnell, of Sea Girt, was riding in a Pullman car, in Florida, and it is a bit of his experience, as narrated by him, that has given me the setback. In the car were two "gens" with a seat full of sporting tackle. On arrival at a station where there was a news stand, one of them went out and returned with a fresh FOREST AND STREAM, which he immediately began to devour. The table of contents was first glanced at and read aloud.

"Jottings from Jersey" he roared. "Well, if here isn't another letter from that liar. You remember the one he wrote me about the black snake? He said he had almost always been spinning just such incredible yarns. Now here is a lot of stuff about sparrow pie and I don't suppose there is a word of truth in it." This is a very mild version of the tirade as McConnell repeats it, but you have no doubt heard enough to sympathize with my determination never to write another line of natural history for publication. To this resolve I should have been faithful, at least until the incident was forgotten. If your issue of May 10 had not changed my mind. When I picked it up and read about seven squirrels inside a blacksnake, a muskrat in a hawk's throat and a chicken in a heron's neck, I felt I was safe. Reading on, I came to the "Partridge Mystery," and assurance became doubly sure. My mind is easy. Write what fact I may I shall never be even remembered as among the dealers in the incredible, while he of Springfield yields his facile pen. Thanks, HORSFORD for your timely rescue.

The New Jersey Legislature did but little to show its ignorance of the game question, and nothing of real benefit. It repealed the act of 1831, which protected deer for three years, and it is now lawful to kill deer between Oct. 15 and Dec. 1. The nearest approximation to game protection is in the supplement to the cruelty to animals act. Section 24 of the original law excepted from its humane provisions pigeons snared in a trap. This section was amended this year by striking out the words "shooting pigeons from a trap," and hereafter that cruel sport must stand on its own merits before the suits of the Society for the Prevention of Cruelty to Animals. If we hear of somebody being sent to prison for this business we shall be more proud than ever of Jersey justice.

And that reminds me of the English sparrow. I notice that the Westchester society has ascertained that the little foreigner is a friend to his insectivorousness and a thief of buds and grain. We are also making "post mortem dissections" of him in this State, and we find him to be a burglar and a murderer. A day or two since a neighbor took down his martin box and found that the sparrows had killed the young martins, driven off the old ones and taken possession of the whole house.

English snipe tried to be abundant, but it was hard for them to still be abundant in the middle of May, and they are probably there yet.

It is the general opinion in Monmouth county that large numbers of quail wintered over, and that they have done well. Rabbits are also reported abundant, and half-grown ones have been seen.

A.

A FOX IN A TREE.—Rock Lodge, Fla., May 6.—While in the pine woods west of Indian River, our dog began barking, and we found that he had an animal up a tree. At first we thought it was an opossum, but upon closer examination found it to be a fox. He was about thirty feet up a pine tree; the tree was straight, with no limbs until very near the top. I shot him through the ear and again in the shoulder, but he still held on. The third shot brought him down. The fox was red, standing about the size and size of the red fox of the North. That the fox ran up the tree we think an unusual thing. Is it common for a fox to take a tree for protection?—W. H. R. [It is not common for foxes to take trees, but we have occasionally known them to do so.]

SEDLIA GUN CLUB.—Sedalia, Mo., May 8.—The Sedalia Gun and Shooting Club met at the Park Hotel May 7. The following officers of the club were chosen by acclamation: Dr. John W. Trader, President; Dr. E. C. Evans, Vice-President; J. C. Parmelee, Secretary; John Montgomery, Treasurer; Frank Houston, Attorney. An executive committee of three, D. K. Smith, John Montgomery and J. C. Parmelee, were appointed, and instructed to secure grounds, balls, clubs and traps, and have them ready by Saturday, May 12, for the inauguration of the season. After the business of the evening was disposed of, President Trader invited the club into the dining-room of the Park Hotel, where an elegant banquet was served, after which the members of the Sedalia Gun and Shooting Club departed for their respective homes, with happy anticipations of an early opportunity of trying various fine novel leaders on the subtle and vacillating balls and clubs. The following are the enrolled members for 1883: S. C. Gold, J. W. Trader, E. C. Evans, J. C. Parmelee, John Montgomery, D. H. Smith, J. Pilkington, A. P. Monev, J. D. Crawford, J. C. Barber, A. W. Eaton, E. W. Stuchlik, C. H. Williams, A. W. Nesbitt.

ROSENDALE GUN CLUB.—Rosedale, Wis., May 7.—At the annual meeting of the Rosendale, Wis., Gun Club, on Saturday, May 5, the following officers were elected for the ensuing year: Mr. S. B. Dilley, President; Mr. T. K. Gillette, Vice-President; Mr. E. C. Sherwin, Treasurer; Mr. Frank Rowe, Secretary. Executive Committee.—Mr. H. C. Graffam, Mr. S. B. Dilley and Mr. T. K. Gillette.—S. B. D.

WELLS BEACH.—Dover, N. H., May 10.—I have just returned from a three weeks' visit to Wells Beach, Me., and found all kinds of sea birds very plenty, and but few gunners there. Just before going to the beach, a friend of mine sent me a bottle of oil for my guns, which I found to be the best thing of the kind I ever used on them. It can be bought of J. P. Lowell & Sons, Boston.—G. A. W.

KYNOC SHELLS.—Editor Forest and Stream: I was surprised at "F. W. B.'s" remarks regarding the Kynoch shells: I think his gun must be at fault, or there is a great difference in the shells. I have tried one hundred of them, and have reloaded some of them several times, and have not had a misfire or any trouble getting them into the gun.—Px. (Osborne Hollow, N. Y.)

## Camp Fire Flickerings.

"That reminds me."

DR. A. and the writer were returning home after a weary row up a very muddy creek after ducks. Dr. A. espies a heron standing on a grass tree about twelve rods off, and has a wager that he can bring him down. Slipping a heavily loaded shell into his gun, he stands up, so as to get a better sight over the tall reeds, and fires. Result: the heron "wends his weary way," while your humble servant is left to extricate the Doctor from the multitudinous mud, with the use of an oar as a lever.

HERON.

Something has just reminded me of this anecdote of that good old angler, Dr. Bethune. Among your readers there must be some who remember him.

The Rev. Dr. Bethune, of the Dutch Reformed Church, was not very clerical looking, even in the pulpit, but in his forest and stream togethery he was something wonderful, even for the woods. A worthy woman, who had entertained him, heard that he was a city preacher. She could not make it out, he was so unlike a preacher in dress and address. However, she knew he would tell her the truth, so one day she asked him if he was really a preacher.

"Madam," replied the Doctor, "I am *verbi domini* minister." That was not English, nor was it Pennsylvania Dutch, but there was a "minister" in it, and something that sounded very like "domine." So in default of sufficient information that score, she said, "Well, where do you live anyhow?"

"Do you know where Manayunk is?" said the Doctor.

"No, I don't."

"Well, anyhow, I live about five miles from Manayunk," was the reply. Dr. Bethune lived and ministered in Philadelphia, and Manayunk, about five miles distant, was not then in its corporate limits.

Geo. L. NEIDE.

SCHUYLVILLE, N. Y.

## Answers to Correspondents.

☞ No Notice Taken of Anonymous Correspondents.

A. W. B.—Use nothing but soap.

"SEAL."—Please send address to this office.

W. S. H., Camden, N. J.—We have not the address you ask for.

W. A. F., Carroll, Iowa.—Is the teal a duck? Ans. Undoubtedly.

J. P., San Francisco.—We have no knowledge of your inquiry. If you will repeat it, we will give it immediate attention.

E. C. V. W.—Copal varnish No. 2 is best for spurs. Decks are usually scrubbed when the yacht is in commission. In the winter they are best coated with common bright varnish. Be careful not to use any oil, or what is known as pine varnish.

The New York.—The autobiography of Davy Crockett was originally published with execrable illustrations by Porter & Coates, Philadelphia. It has been brought out in the Seaside Library (price 25 cents). Dodd & Mead, New York, published a life of David Crockett, by John S. C. Abbott, which is the "Autobiography" clipped up and patched together again.

ROB STAY.—New list is promised shortly. It will cost \$2.50. Keels of boats should last more than seven years if kept thoroughly dry during the winter months. If the keel and bottom of a boat is kept on the earth, especially where grass grows, in one or two years it will be found to be rotten. A yacht (right or dead boat) built in the ordinary manner, and one that carries no dead weight, will float for hours after she is upse.

OWEN SOUND, Ont.—I have to report the shooting this week of what I take to be a good one of the *Clayton's heron*. The following is a description of the bird: Head and upper part of neck shining green, back black and gray, wings black and white, breast and belly of delicate reddish buff color, legs black, feet red, feet and claws black, feathers on back of head elongated. Mr. Miller, our sporting jester, sent the bird to Toronto to be set up. He got it from a Mr. Young, who shot it on or about the back of the town. Is it a rare bird in these parts? Ans. Not a rare bird.

## Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notices of good fishing localities, and our correspondents favor us with notes of desirable points for angling excursions?

### GEORGIA FISHING.

GATHERING tackle, rods, and bait, last week, Capt. Ed. Peabody, as genial and ardent a fisherman as ever wet hook in babbling brook, placid lake, or rushing river, and ourself, took buggy, and sped away to "Douglass" Lake, embowered in green wood shade, two miles east of Bainbridge. Two hours of soft melting April sunshine had sweetly sunned up old Dame Nature's face; ere we drew rein at our destination.

Unloaded, transferred our fishing gear to the boat, which was to bear out "Cesar and his fortunes," but us, and our luck, over the broad bosom of the lake that tranquilly lay before us, "a thing of beauty," reflecting from its mirrored depths the fresh green leaves of the long branched oaks, densely wooded and leaved. May-haw trees, literally packed with fruit, rising from its depths, cast without interruption a dense shade over its face from one end to the other. We unlock our craft, seize the paddle, and with quiet strokes send her noiselessly over the surface. Peabody, on the alert for a good place, sings out: "Gurley, there's the place," pointing to where those large oaks tower straight-boughed, high above the water's surface, and with interlacing boughs overhead, form a complete canopy of shade, leaving a clear space of water, whose oval shape is fringed with lovely May-haw trees, whose ripe fruit kisses the quiet waters. Quickly I lay the boat alongside an old log on the margin of the tempting spot.

Hooks are baited and cast in for fluky prey. Ed gets a bite, a very shy one, that gets away so cautiously that the movement of the float is almost imperceptible. He strikes, and such a strike! Had he hung the fish, the little fellow would have landed about the size of a "Sagehen," and after a little had got "catch on" to anything but worms, and saved himself from utter ruin. Getting the first bite made our friend awful high-minded, and instead of casting into the water, he sent his hook flying into a tree top. There it stuck, and we had to move up the boat to get it. This done, we try again, and get no bites.

Again we cast off, and creep from spot to spot, until we find a hungry crowd of willing, fierce biters, housekeeping under a dense shade of oaks, whose branches hang so low that we find it almost impossible to use our rods. Reader, don't you wish you had been with us, just at this time! I know you do. As fast as one hook went down in the depths, away went a gallant, plucky fighter with bait and hook. A gentle pull, the steel fastens into his greedy jaws, and away he flies, making the line sing through the clear water. A long pull and a strong pull brings him to the boat, and the pretty prize is ours. For one whole hour, with unintermitting, we ply rod and steel, and take in the lively beauties, at the end of which fifty noble specimen of the perch tribe reward our efforts. Proud of our success, and somewhat hungry, we draw in our lines and turn our boat toward shore, where friends await to cook and eat our catch. Turned over to the cooks, they are quickly prepared, and then followed a feast the Gods might envy. O. G. G.

### TROUTING IN THE MUSKOKA DISTRICT.

DOUBTLESS many readers of the FOREST AND STREAM have fished for the speckled beauties in the dark and turbulent waters of Muskoka and Parry Sound districts, while many more have contemplated a trip to the wild woods and foaming rivers of Northern Ontario. For the information of those who intend to come and have never before made the trip, the best, cheapest and quickest route to reach the Muskoka district is from Port Huron, via Northern Railway, to Gravenhurst, then by team a distance of twenty-four miles to Oakley, on the south branch Muskoka, where there is good trout fishing on the river and its many tributaries. Or, go on from Gravenhurst by steamer to Bracebridge, then by stage to Trading Lake, then on by steamer to "Cedar" Narrows, where trout and mosquitoes will make it entertaining for the sportsman. Another route from Bracebridge is by stage to Port St. Joseph, a distance of twenty miles, then by steamer to Huntsville, then by stage to Emsdale, a distance of sixteen miles. Here is where the angler will strike waters of the Maganetawan River at Itaged Creek, where there is good trout fishing, and further on east about seven miles by stage the Maganetawan River at Kearney is navigable for skiffs and canoes without portage to Big Sand Lake, where there is good fishing. Another route is from Gravenhurst by steamer to the head of Lake Rosseau where "Poulin Pratt" keeps tavern. Who is he? He is that has not heard of W. H. Pratt? If there are any lovers of the rod and gun that ever visited the wilds of Muskoka, and never heard or saw mine host of the Rosseau House, they saw but very little of the country. From Rosseau by stage to Maganetawan village, a distance of thirty-seven miles; from Maganetawan village by steamer to Buks Falls, a distance of twenty-four miles to the Maganetawan River. Or another route from Maganetawan village, is by stage to Lake Nipissing, a distance of thirty-seven miles, and when the sportsman reaches Nipissing he can choose his route and waters for his sport. By coming down the French River to the Georgian Bay, and taking a steamer from the mouth of French River to Collingwood, or Midland, or portaging across in Lakes Tulon and Trout, and then into the Mattawa waters, then down the Mattawa, or handling the C. P. Railway at North Bay or Sargons Falls, and riding thence to Brockville or Montreal. The steamer inter-ocean makes daily trips across Lake Nipissing.

And another route is from Lake Rosseau by stage to Parry Sound, a distance of twenty-four miles, where bass and maselange fishing cannot be excelled. From Parry Sound to McKellar, by stage, a distance of fifteen miles. Or, by stage to Glenora, a distance of twenty-four miles, or, on through to Comondia and Lake Nipissing. Or from Parry Sound to Collingwood, Penticton, or Midland, by steamer. If any sportsman fails to enjoy himself over any of the routes mentioned, I cannot tell him where to go to find fish and sport. MAC.

PARRY SOUND, Ont., May, 1883.

## KINDERHOOK LAKE.

HALF an hour of brisk travel eastward on one of the swift trains of the B. & A. R. R., through pleasant farm lands and villages, and you leave the cars at cool, shady Kinderhook. You catch a hasty glimpse of a considerable body of water, picturesquely situated, a moment or two before the train stops, and you slightly conjecture it to be the justly famous Kinderhook Lake, the richest gem in Eastern New York.

The three rival magnates of the three rival establishments for fishermen, tourists and excursion parties, will meet you as soon as you leave your train, confusing you with flowery promises of the conflicting charms of their several places. Joking aside, you may go with either of these, for "whichever" you choose will see to it that you are splendidly entertained and cared for.

For convenience sake, and for the purpose of thoroughly "doing" the lake, it will be wise on this special occasion to put yourself in charge of "Jorry" Clapper, the gentlemanly proprietor of "The Outlet." A two-minute walk from the depot and you are in sight of his comfortable cottage, cosily nestled down upon the left bank of the handsome stream that empties the lake, flowing from its southwestern extremity.

Once in sight of the dock, with its gaily painted boats and multitudinous fishing paraphernalia, you quicken your steps, listen across the bridge, and, aided by the ever genial Jorry, select your "kit" and push out into the stream. A few strong pulls and you are through the railroad culvert, gliding up the creek in eager expectancy of entering the lake with every car-stroke. The birds in the overhanging branches along the shore are unheeded and their song unheard; the lake is the one consideration of the day, to which everything else must be subjected. Alas! the provoking willow-cowp is passed and you see the lake. Now, once again—a long pull, a strong pull, a pull altogether, and you leave the stream with its narrow bounds and glide into the lovely lake, delighted, transported, enraptured.

First on your ears and glance about you. Stretching far away to the north is the extensive point of Main Lake; let the eye wander along down the eastern shore, taking in the wooded point that shelters Milham's Cove, and still further down, admiring the rough, indented shore skirting Milham's Woods, until the long, high promontory with which Lake House Point terminates cuts off the view. Between you and Lake House Point is another long, narrow peninsula, reaching away to the northward from the mainland that bounds the western limits of the lake. This is Raedler's Point, and a few ill-fated strokes send your frail craft skimming around it toward Lake House Point. Suddenly you glance to the southward, and there, coynely secreted between the two extended points, a scene of surpassing loveliness awaits you, in that beautiful portion of this irregular body of water, the Round Lake:

"The conversation, and the poet's dream."

Cast your eye to the northwest, and here Packman's Cove, another surprise, awaits you; a grove on the left and another on the right, add to its beauty. This arm of the lake lies parallel with the upper end of the Main Lake, but is much narrower, and of far less value as a fishing ground. The section of land dividing the cove from the lake proper, is somewhat strangely styled Packman's Point, though it bears little resemblance to a point. The solitary stream that feeds the lake, flows circuitously past the quiet villages of Nassau and North Clatham, through grassy pastures, and among sloping hills, entering the Main Lake a little north-west of Milham's Cove. Above this inlet the creek, just described, is joined by a smaller one, a mere rill, that flows from a small pond to the north, bearing the distinguished and somewhat misleading name of Lake Knickerbocker; adding a mere breeding place for frogs, mosquitoes, and malaria, it hardly deserves so "dignified" a designation.

Having crossed the upper end of the Round Lake, you sail to the lower side of the two small islands, sweep around Lake House Point, and drift down the Main Lake toward Trimmer's Dock. Here, also, is a new revelation. You are now about half way down the Main Lake, the two extremities each a mile distant. Above, circling around the head of the lake, a succession of sloping hills undulate, unevenly, to the north and east. To the south the low country gradually slants off, low and flat, into the Hudson Valley. An orchard and meadow border the waters on the south, merging into other farming lands, up the eastern shore, past the Lake Shore House, joining Milham's Grove just across from Lake House Point.

Your boat grates on the beach, you jump out and secure it just in time to enjoy a hearty welcome and handshakes from "Bob" Trimmer, the gentlemanly proprietor of the Lake House. It is now the magic hour of noon, and with an accommodating smile, Bob leads you to the dining-room. Here you are! Fresh fish, choice steaks, perfectly broiled and smoking hot, sweet milk, pure and unadulterated, and an endless variety of delicacies from Bob's extensive garden. It is a dinner for a king, but sufficient "regality" to enjoy it with a keen relish is easily assumed.

After dinner you of course go fishing. Bob provides you with that Prince of fishes, John Linn, who rows your craft with steady stroke to all the choice fishing grounds; mitigating the wild excitement your sport occasions with timely suggestions, he aids you to capture a reasonable "mess" of the glorious bass and pickerel so abundant in Kinderhook Lake. At length, after a most enjoyable half-day's fishing, the sun goes rudely down in the west, and, to complete the various enjoyments, John rows you over to the Lake Shore House for supper. Landlord Allen is all attention, and you bid him "good-night" brimful of that "solid satisfaction" that always follows a fine day's sport with a square meal for an epilogue. John is awaiting you in the boat, and rows you silently back to Trimmer's in the dim starlight. You leave of him here, and pull lazily for the head of the lake, to while away the two hours remaining before the train leaves for Albany. Then you float lazily back down the lake, past Milham's Grove, flickers the campfire of a party of Bostonians; directly opposite, on Packman's Point, hang the colored lanterns of a camping party from the Capital City.

Just as you stand out between the two camps off Lake House Point, the full moon rises suddenly, brilliantly illuminating the western shores, and leaving the eastern shores in dark shadow. Lovely as was the scene by daylight, it is infinitely lovelier now; something about it recalls, momentarily, that one line of Scott's on Melrose Abbey:

"Never was scene more sadly fair!"

A party of dancers are on the grounds at Trimmer's—one of the many excursion parties who haunt the lake all summer long.

There is something weird about it; the line from Scott awakens another train of thought; the camps, the dancers, the songs from the boats all around you, all mingle together to strengthen your fancy. It is wonderfully like, on a moonlight night, the Scottish Highlands. Then, too, Lake House Point, in the soft moonlight, looks, for all the world, like Ellen's Isle, in Loch Katrine. A shadowy glimpse of the Catskills, to the southwest, adds to the resemblance, and, to complete the picture and perfect the scene, a dark boat swiftly past, containing a party of musicians. As they disappear in the shade to the left of Lake House Point, they take up Rodierick's famous muster song, "Hail to the Chief." Then, in profane thought, you suddenly remember that it is nearly train time. Away romance, poetry, sentiment; pick up your oars and hurry along to Clapper's. With a sigh of commendable regret, you row silently to the mouth of the creek. Near the stream you rest a moment on your oars, and let the boat drift. One more burst of music reaches your ears, faint and almost indistinct; the musicians are playing the closing strains of "Bonnie Dundee." The music stops; new and cricket sing their discordant songs unheard. You confine dreamily down the stream to Clapper's, wishing all sorts of impossible wishes.

Once more you land, and Jorry breaks the spell with a bountiful supply of lemonade and sandwiches. He cheerfully bids you "Go for 'em!" while he packs your fish and other luggage for the journey home. Forgetting your splendid dinner and supper, you imagine yourselves half famished and greedily devour Jorry's daily refreshments. Then, alas! you go to the depot and buy your ticket for Albany; the train drives in and whisks you regretfully back again into the crowded city.

Well, you've had one day's fishing on the lake that enchanted N. P. Willis, the luxurious day-dreamer, and where Matty Van Buren and a host of other famous old "Yan's" have frequently held their revels in days gone by. You go to bed thinking of the day's events, except the daily refreshments from the lake, being a pleasure. Somehow your slumbers are troubled with visions that shift in a confusing sort of way from Kinderhook Lake to the Scottish Highlands. You are, in your dreams, once more members of a jolly fishing party; this time it is Jorry Clapper, stalwart Jamie Douglas, Bob Trimmer, Rodierick Dhu, John Linn, Henry Allen and a host of other impossibilities, old Watty Scott, the wondrous "Wizard of the North, among the rest. Black Rodierick is just proposing a toast to Kinderhook Lake, when the vision fades; you open your eyes; you are snugly laid away in bed and the morning sun is shining in upon you. You rise, deeply regretting that it was "all a dream," perform your ablutions and breakfast on the delicious fish you captured yesterday on dearly-loved, never-to-be-forgotten Kinderhook Lake. Oh! that life was an endless holiday!

ALBANY, N. Y., May 7.

H. RUTHER JATTIE.

## DOES THE MASCALONGE LEAP?

IN the issue of FOREST AND STREAM for April 19, I notice the rather surprising statement, made by Mr. Elihu Plimney, that from one-half to two-thirds of over five hundred mascalonge caught by himself and friend, "threw themselves, the instant they were struck, either entirely or partly out of the water."

I have had some experience fishing in Canadian waters for mascalonge, especially in the same region of which he speaks. During the month of July, 1878, I spent almost every day fishing for bass and mascalonge, and my efforts were handsomely rewarded.

Since reading the article above referred to, I have thought the subject over, but cannot remember of a single instance where the fish leaped from the water upon being struck. Indeed, my experience was exactly opposite, for, instead of rising they would invariably go to the bottom, and when they were taken from the water, it seemed as if they came direct from the bottom.

I remember that the difference between the actions of bass and mascalonge, when struck, was a subject of comment between the guide and myself. I could tell almost every time, without seeing the fish, whether I had a bass or mascalonge, and so the fish was taken. A four-pound bass would afford more sport than an eight-pound mascalonge.

Why is it that the flesh of bass taken from Stony Lake is not so solid as the flesh of those taken from St. Lawrence River and Great Lakes? The water being considerably warmer, may be one reason. During the coming summer I intend to spend about a month in this region, and will make close observations as to the habits of the mascalonge.

SPRINGFIELD, O., May 7.

## PENNSYLVANIA NOTES.

THE Pennsylvania Angler's Association has stocked the Perkin Creek with rainbow trout, and we are glad to learn that instead of making a promiscuous planting, the head waters, which are not so plentiful, and, as some say, do not exist at all, were chosen, and the lower portions of the stream nearer the Schuylkill were properly passed by. This society will do a good work for our portion of the State, and is a live and active organization. It is said that one great cause of the depletion of the Schuylkill River waters of its bass, especially the portion which runs through Fairmount Park, is the netting of the fish at all seasons of the year by a large number of netmen, who, in violation of the law, have been doing so for several years, and it is proposed to appoint a warden whose business it will be to patrol the river and arrest offenders. Would it not be an economical plan to interest some of the railroad "track walkers" and offer them a fee for every case of netting they discover? The railroad track runs close to the Schuylkill River, many miles above Philadelphia, and if the proper officers of the Reading Railroad were seen I have no doubt their consent could be procured to have the employees interested. Gov. Pattison of our State has signed the bill which will allow the Pennsylvania Fish Commission to sell the Marietta Hatchery property and to select waters better adapted, and we hope to soon hear of a new site chosen. Our trout fishermen are now all off on their delayed trips. Your correspondent received a despatch yesterday from Lehigh Valley, reading, "Come up, trout are ripe, and I intend to stay in Philadelphia this week, and perhaps lose the best of the sport, which is only had in the Lehigh Valley streams the first week or so of the season, and the pleasant weather coming upon us this spring all at once we may expect but a very short season."

PHILADELPHIA, May 11.

Hoxo.

## SOME SOUTH AMERICAN FISHES.

WE were recently favored with a loan of an old work, the property of Mr. Francis Endicott, the title of which is "A Voyage to South America: Describing at large the Spanish Cities, Towns and Provinces, etc., on that extensive Continent. Interspersed throughout with Reflections on the Genius, Customs, Manners, and Trade of the Inhabitants, together with the Natural History of the Country. And an Account of the Gold and Silver Mines. Undertaken by Command of His Majesty the King of Spain by Don George Juan and Don Antonio de Ulloa, both Captains in the Spanish Navy, Members of the Royal Societies of London and Berlin, and Corresponding Members of the Royal Academy at Paris. Translated from the original Spanish, Illustrated with Copper Plates. Dublin. Printed for William Williamson, at Meccenas's Head in Bride street, 1758." in two volumes; from which we quote:

Of fish there is a great variety daily brought from the neighboring ports of Chorrillos, Callao, and Ancon, the Indian inhabitants of which make fishing their whole business. The most palatable are the corbinas, and the paje reyes, or king's fish; but those in the greatest plenty, and at the same time very palatable, are the anchovies. The corbinas and the king's fish infinitely excel those of Spain; the latter is also remarkable for its size, being generally six or seven Paris inches in length; yet even these are thought to be surpassed by those caught in the Buenos Ayres River. It is a salt water fish but very little different from that caught in the rivers of Spain. The river of Lima affords a sort of prawns, two or three inches in length, but these should rather be called crayfish. The whole coats abound with such shoals of anchovies as exceed all comparison, and beside the quantity caught by fishermen, they are the chief food of innumerable flocks of birds, with which all these islands abound, and commonly called guanicos; many of them are indeed alcatrazes, a kind of owl, though all commonly bear the general name of guanico. A little after the appearance of the sun, they rise from these islands in such large and thick flights as to totally cover them, and fly toward the sea for an hour or two, without any visible decrease of their number. When at some distance from the land they divide themselves, and begin their fishing in a very entertaining manner. They fly in a circle at a considerable height above the water, and on seeing a fish, they descend and devour it. The most rapid and their wings closed, with such force that the agitation of the water is perceptible at a distance; after which they rise again into the air and devour the fish. Sometimes they remain a considerable time under water, and rise at some distance from the place where they fell, doubtless because the fish has endeavored to escape, thus disputing celerity with them in their own element. \*\*

The islands of Juan Fernandez abound greatly in fish of various kinds, among which are two species not observed in any other part of this vast sea. One is the cod, which though not absolutely in every particular like that of Newfoundland, the difference is very minute, either with regard to color, form, taste, and even the small scales observable on that fish. They are of different sizes, but the largest three or four feet in length. The other species is a fish resembling the tolo in shape, but much more palatable. From the fore part of each of these two fins on its back grows a kind of sharp spine a little longer than the body, and back, and terminating in a point. It has a fine gloss and the hardness of a bone. At the root of it is a soft, spongy substance. This spur or bone, for it resembles both, is such a present remedy for the toothache, that the point of it being applied to the part affected, it entirely removes the pain in half an hour. The first account I had of this singular virtue was from a Frenchman, who was my pilot, but as a reason would not permit me to give credit without experience, to a circumstance seemingly so void of probability, the assertions of the man increased my desire of putting it to the proof, which I did several times, and always with success. I did not fail to communicate a discovery of such great benefit; and accordingly several of my acquaintances, who labored under that excruciating pain, made a trial of it, and found from it the same happy effects; with this particular circumstance, that soon after the application of the bone to the part affected, it became insensible to pain, a drowsiness succeeded, and they awoke free from the torture. I observed that the spongy substance at the root, during the operation, became greatly inflated, and softer than in its natural state, which could not be affected solely by the moisture of the mouth, the part put into it being compact, hard, and smooth as ivory. I am therefore inclined to think that it has an anesthetic virtue, which attracts the moribund humor, and collects it in the root. The common length of these anodyne spurs is two inches and a half, of which one moiety, together with the root, is within the body of the fish. Each face of the triangle about four lines in breadth. The fish is taken in the same plenty as the others. \*\*\*

The seas on these coasts abound in excellent fish, though not in nearly so great a degree as those near the island of Juan Fernandez. Here are seen, in particular, a great number of whales, which come even into the bay; also a tunny and sea wolves. Among the amphibious creatures here is one known all along these coasts, and even at Callao. It is called *Pajaro Nino*, the bird-child. In its home parts resembles a goose, except that its neck nor its bill is not arched, and is something larger. It has a thick neck, a large head, and a strong, short bill; its legs very small, and its tail, its body is in an erect position. Its wings are small, cartilaginous, and nearly resemble the fins of the seal. Its tail is so small as hardly to be distinguished; its wings and whole body are covered with short brown hair, like that of the sea wolves, and generally full of white spots, though some are of other colors; so that upon the whole the bird makes no disagreeable appearance. It lives promiscuously, either in the water or on the land, and has the flesh, when taken, being very strong in its motions, but when attacked bites severely, though it is observed never to be the first aggressor. \*\*\*

These harbors or roads [Island of Fernando de Noronha] abound in fish of five or six different species; among these are lampreys and morones, the last of an enormous size, but neither of them palatable. At the bottom of this harbor is taken a fish called cope, from its triangular figure. It has a snout not unlike that of a hog, and its whole body is inclosed in one broad resembling horn, within which the flesh, brain and other parts are contained. The upper superficies is covered with green scales, and underneath with white. It has two small fins like other fishes, and its tail, which is horizontal, is also small. On being taken out of the water it immediately emits from its mouth a greenish froth of an insupportable smell, and which continues for a considerable

time. Some of our people who had seen this fish in other parts affirmed that its flesh was of such a poisonous nature as to cause the bodies of those who eat though but moderately of it to swell till they burst. But the people of this island were as positive to the contrary, and affirmed it from their own experience. They, however, make use of this precaution before they eat it; namely, of laying a great weight on the fish's head, part of which might have been out in the foam; and after keeping it a whole day in this manner they open the hard shell in which it is enclosed, boil it till about half ready and then shift it into other water. By these precautions they affirm that all the noxious particles are extracted. But, in my opinion, this troublesome process is thrown away, the taste of its flesh not being at all answerable, and even were it in any degree palatable, surely the remembrance of its fetid smell must disgust the stomach.

## THE FISHERIES EXHIBITION.

[Dispatches to the Associated Press.]

LONDON, May 12.—Although the sky was lowering this morning, and although there were dashes of rain during the day, accompanied by a heavy, murky atmosphere and disagreeable walking, there was a tremendous attendance at the opening of the International Fisheries Exhibition at Crystal Palace. From the morning till the evening the buildings were packed with carriages and foot passengers at an early hour of the morning, and long before noon the twenty-three acres of buildings were filled with spectators from all parts of the world. The details of the ornamentation and arrangement were not complete, owing to the unexpectedly heavy amount of work which the preparations entailed, but the decorations were so managed that they concealed in a large degree the temporary defects. The general effect of the scene was very fine.

The Prince of Wales, accompanied by his sons, reached the main hall at 12:10 o'clock, and his entrance was the signal for most enthusiastic cheers. The dais in this section, to which the Prince was later conducted by the exhibition officials, is a beautiful affair covered by a handsomely wrought canopy. Surmounting the canopy and artistically setting it off was a crown, from which were suspended festoons of flowers. From the canopy the ceremony of introducing the royal party to the mysteries and beauties of the place proceeded according to the programme outlined last night. From the conservatory the party was taken through the first hall of exhibits—that devoted to Great Britain—passing thence directly into the departments where were displayed the piscatorial treasures of the United States and Canada. These were given considerable attention and attracted much favorable comment. Depositions of fishermen were drawn up along the line of route, the most conspicuous and picturesque of these were the Indians of Canada.

James Russell Lowell, United States Minister to England, who had joined the party with other diplomats, was not the least interested observer of the display. After viewing several other exhibits the party returned to the dais, where the address of the committee was delivered by the Duke of Richmond. He explained the benefits of the exhibition; that it was intended not only to furnish an agreeable and instructive spectacle, but that it was intended that the public should receive an actual daily benefit as the result of it; that the practical cooking of fish was to be illustrated by the National School of cookery, and that the committee had kept steadily before them the fact that the exhibition was for the million. He announced that the exhibition would be open several times a week for the benefit of the working classes; that he expressed in terms of hearty thanks the gratitude felt by the committee for the cordial manner with which applications for assistance in the undertaking had been received and responded to by foreign governments and by the colonists. He then formally bade the Prince of Wales and his party welcome to the exhibition.

The Prince in replying read from manuscript. He expressed his regret in being able to assist at this ceremony, and regretted that an unfortunate accident had unavoidably prevented the Queen from being present. He hoped that the exhibition would be the means of bringing to the notice of the people the latest and most efficient methods of securing the bounty of the streams, lakes, and oceans, and would thereby be a practical benefit to them. He dwelt at some length on the importance of the life-saving section of the display and commended it to the attention of the people. In conclusion he conveyed the thanks of the Queen to all the countries and colonies which were taking part in the display, and to their representatives for their untiring exertions in bringing the matter to a successful issue. He was warmly applauded. After some further exercises the exhibition was formally declared open.

LONDON, May 14.—At a banquet in Fishmongers' Hall, given in honor of the International Fisheries Exhibition, the Prince of Wales said the contributions of the United States to the exhibition were especially deserving of credit. Mr. Lowell, the United States Minister, replying to a toast to "Foreign Representatives," thanked the Duke of Edinburgh for the kindness with which he had proposed the toast, and said that the kindness with which he had met him and in England convinced him that he represented an elder daughter of England rather than a foreign country.

## NORTH AMERICAN FISHERIES.

BULLETIN No. 16 of the United States National Museum is a large octavo of 974 pages, exclusive of index. It is the Synopsis of the Fishes of North America, by Prof. David S. Jordan and Charles L. Gilbert. This volume will give the fisherman and the sportsman a working knowledge of the fish that he claims to be a synopsis and not a complete description of every North American fish, yet it gives the more important characters of each species. We notice that there are five species of the Pacific salmon, genus *Oncorhynchus*; nine *Salmo*, including the Eastern salmon and the Western trout, and eleven char, genus *Salvelinus*. The genus *Cristiomer*, Gill and Jordan, is not retained, but the Eastern whitefish is now classed with the char. Of the latter we note the following, which are retained as valid species: *S. namaycush*, *sicocet*, *ogassua*, *variegatus*, *arcticus*, *malma*, *fontinalis*, *humboldtii*, *rossi*, *nitidus* and *stagnatus*. The "Canadian sculpin," or "salmon-trout," is merely noticed as a different form and coloration assumed by *fontinalis* when it goes to salt water for a length of time. The nomenclature of Henshall is followed for the black basses, and we think that it will stand more firmly on its legs than the confusion that has existed. We looked to see more fresh water gars on the list, but find only three. Former workers made more, but the tendency to-day, with the great collection of fishes of the

National Museum at hand, is to condense. So many connecting links are found which blend one apparently different form with another, that a series of fishes of one genus, taken from many localities, will have so many common characters, which mingle to such an extent, that the naturalist can only call those of widest divergence by the name of varieties. The most puzzling thing in natural history work is the question, "What constitutes a species?" and it is one that offers a chance for many differences. The Synopsis has a most complete index, which includes popular names, and it adds greatly to the list of valuable work already done by these authors.

Of all the writers in American ichthyology Prof. Jordan has done more than any other to popularize the science by writing in a manner suited to the popular comprehension by using only such scientific terms as were necessary to the understanding of his subject and for which there is no adequate vernacular term. His "Manual of the Vertebrates" covered ground never before attempted and gave a clear and lucid description of all vertebrates found within the district bounded by the Mississippi River on the west, North Carolina and Tennessee on the south, excluding marine species. His "Contributions to Ichthyology," in three bulletins of the National Museum, added to his work and his "Fishes of Ohio," in the Geological Report of that State, enriched our knowledge of Eastern fishes. The present work extends that knowledge to all the fishes of North America and places Jordan and his co-worker, Gilbert, among the foremost men to popularize the study of fishes. This last work covers the whole of North America and will be found of the greatest value.

## TROUTING IN PENNSYLVANIA.

TROUT fishing has formally opened in Central Pennsylvania. The snow has all disappeared from the mountains, and the trout streams are resonant again with their rippling spring laugh, as they rush hurriedly along their courses to the rivers.

Notwithstanding the backwardness of the season and occasional sharp relapses, fishing has thus far proved very successful in several localities. April and May are rather dull months for trouting generally herabouts; nevertheless, the "poacher" and the "trout hog" are at work before the season opens legally; and in order to meet with anything like success, the sportsman angler must go early in the season, or he will find the streams quite "fished out," as the old backwoodsmen term it.

From the incessant "whipping" to which the trout streams have been subjected within the past decade, they have not had time to recuperate, and the consequence is that the speckled beauties are becoming exceedingly scarce and shy. On likely days in June, by getting far back into the brush, some fish may yet be taken; but they are not of the average size, and should be left over for another season.

A recent trip to the Seven Mountains, a famous sporting place in Central Pennsylvania, convinced us of the fact that the glory of those ancient notes, April and May are rather dull months for trouting generally herabouts; nevertheless, the "poacher" and the "trout hog" are at work before the season opens legally; and in order to meet with anything like success, the sportsman angler must go early in the season, or he will find the streams quite "fished out," as the old backwoodsmen term it.

Quail and ruffed grouse have been abundant about here for the last few years, and from a stump, a post, or an old stone wall can daily be heard the piping of "Bob White." Several flocks of these little fellows have wintered on my father's farm the past winter, and in the early morn when rousing from my slumbers I can hear their vigorous notes from the orchard. From the present outlook, game, such as quail, grouse, quail, squirrels and rabbits, will be plentiful during the coming season. About one-fourth of a mile distant from our house is a favorite woodcock ground, where every summer, after harvest, my brother and I, accompanied by our cocker Joe, have a fine afternoon's sport. Wild ducks and geese are passing northward in large numbers. A few stragglers are now and then secured along the creeks and rivers, where they alight to feed.

W. K. M.  
SALEM, Pa., May 7.

## "ANGLING TALKS."

EDITOR'S PREPARATORY NOTE.

THE following chapters were written by Mr. Dawson subsequently to his retirement from the editorship of the *Albany Evening Journal* last September. The series was broken off by the author's lamented death in February.

The "Talks" attracted wide attention at the time of their publication in the angling columns of the *FOREST AND STREAM*, and were received with very cordial appreciation. It is thought that their collection into the present more permanent form will prove acceptable.

As a political writer of conceded power, Mr. Dawson wielded a potent pen when he turned from the conflict of parties to the praise of the favorite pastime of "Angling." His essays, limpid as the crystal streams, are aglow with the soft summer sun, light and melodious with the songs of birds. When angling was the theme, he wrote from a full heart and in closest sympathy with the scenes and pursuits described. These "Talks" are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he performs shares the author's enthusiasm. The effect is magical, like that of the music players in Xenophon's *Memorabilia*; he who reads it he be angler, must go a-fishing; and if he be not, straightway then must he become one.

FOREST AND STREAM OFFICE, April, 1893.

"SUN BURN."—Editor *Forest and Stream*: Now that the boat-sailing and fishing season is upon us, will *FOREST AND STREAM* kindly favor its numerous readers, as well as myself, with the benefit of its wide experience in a matter, which I am sure will be of interest to many. To begin with then, I am, like thousands of others, extremely fond of boating, during the summer months, but my life is rendered absolutely miserable, while in pursuit of this rational recreation, by my susceptibility to "sun burn." My face and neck become scarlet, the first day on the water, and my nose is in a conspicuous state of alternate "blister" and "peel." This is objectionable, not only because it gives one the appearance of a confirmed "toper," but also because it is a positive discomfort. Will you suggest, through your columns, for the benefit of those similarly afflicted, some remedy that will protect, or at least, quickly relieve one's countenance from this "burning shame."—KERR.

TENNESSEE.—There have been a number of fishing parties out within the past month, and each has met with good sport. Mr. J. E. Warner informed me the other day that he captured a genuine Virginia "horney head" while out fishing a few days ago in one of our Middle Tennessee streams, but which one has escaped my memory. This is the first instance of the kind I ever heard of in this State. There are two or three angling clubs about here at present; one has leased a portion of Tarble's Creek, but the other has a series of ponds stocked with game fish, but fish being close communions, none but the angler (with money) can even get a chance to verify the statements of their fish lore. They entertain among themselves, have fatted pigs and mutton barbecued, trip the light fantastic, and indulge in the pastimes, though as to the skill displayed in angling, or what they get in making it, no one ever hears. Mill, White's and Brown's creeks, have been effectively depopulated of fish by the seiners, cloggers, and trappers, who are permitted to infest their margins, the fish commissioner being one of the quiet, good-natured, indifferent sort of persons, who cannot waste his valuable time to carry out the purposes for which he was appointed. All the pay he received or was to receive, was granted with the commission and its proud title. The truth is, that a person who has one spark of the true sportsman's sentiments in his composition, gets disgusted at chronicling the unsatisfactory condition of fish sports on the men who follow them about here, as they are often exaggerated, and hard to get at, even then. Perhaps when the country fills up with a new sort of folks the panorama will change, or rather the figures in it, as the picture is now perfect so far as nature has had to do with it.—J. D. H. (Nashville, Tenn.).

BLACK BASS IN WISCONSIN.—Columbus, Wis., May 10.—Fishing is excellent here. Black rock "silver" bass is picked like candy. I believe it would be impossible to find a stream where the above named fish exist more bountifully than they do here. On the 6th, with a friend and a good supply of live minnows, they being preferred to all other bait here, we reached our favorite stamping ground bright and early. It had been raining, but the sun was shining bright and warm an hour later. My minnow had no more than touched the water than out came my line as swift as an arrow; my rod bent nearly double, and not daring to give him any slack, Nowdie had to assist in landing a five-pound black bass. When my friend returned to his rod he found that one of the finny tribe had borrowed it and was hauling it away. He succeeded in recovering it with a three-pound black bass attached. Thus the sport went on for some time. About noon they ceased to bite, and my companion was half asleep on account of the stillness when he felt a slight tug at his line. Had a gun exploded in his ear he could not have jumped higher. Out came a large black bass, and he was landed about sixty feet beyond. A few years ago the silver bass was an entire stranger to these parts, and when first seen they were in large schools. They are larger than the rock bass, covered with bright silvery scales; hence the name. They are very greedy, and are caught near brush piles. It is a mystery how they come here. Are they the right name, and how did they come here? The *FOREST AND STREAM* is a welcome visitor every week, and we shall never be without it.—WANDERER.

TIM POND AND THE SEVEN PONDS.—Letters from this noted resort inform me that the note of preparation is being heard throughout this region so much frequented in the past. Mr. Kennedy Smith has put in a good store of ice, and a good supply of other useful supplies to be in readiness when his guests arrive, a large number already having engaged accommodations. Roads and cabins are being improved and put in order. Edgar and his wife, who did so much for the comfort and pleasure of the sportsmen and their wives last year, are to have charge of the Tim Pond village of cabins the coming season. Mr. and Mrs. Lambert, who made the wilderness blossom as the rose at the Seven Ponds last year, direct the lovers of forest and stream again as they visit those matchless waters, and feast not alone upon the viands of the table, but the rich mountain scenery. The ice and snow is fast disappearing, and by the first of June all things are likely to be in readiness for as good trouting as may be found in Northern Maine. The Boston and Maine, the Eastern and the Somerset railroads have given the matter especial attention, and made first-class provisions for the wants of sportsmen, and I am told the stage accommodations will be adequate to the wants and comfort of the public from North New Portland to Smith's Farm. The Dirigo House at North New Portland has a new proprietor, who has repaired and refurbished the house. So all things are ready.—J. W. T. (New Britain, May 12, 1893).

WASHINGTON TERRITORY FISHING.—The writer had proposed making a trip over the Northern Pacific Railroad in September, when it is proposed to have it opened, and with a view of "going a-fishing" had written his son in Washington Territory as to best place to stop. He writes: "Leave the road at Rathdrum station, twenty-six miles east of Spokane Falls; go over a splendid road fourteen miles to Lake Cou d'Alene; fish up and down the St. Mary's River that empties into the lake, in the best of luck, where the celebrated 'bull' trout are caught, and you can be assured of excellent sport. There is a hotel and military post at the lake."—E. A. S.

STRIPED BASS AND BLUEFISH.—Striped bass are now being taken freely at Roblin's Reef. On Monday last one weighing thirteen pounds was taken in the Hudson opposite New York City at Pavenia Ferry. This week small bluefish of two pounds weight have appeared in the market, having been taken on the New Jersey coast. The larger bluefish in market are southern fish.

THE TARPUM AS FOOD.—The *New York Times* says: "Somebody asks, in the *FOREST AND STREAM*, as to the edible qualities of the tarpum. It has been tested two or three times in New York from large fish brought from Florida, and found not to be worth eating, but perfectly tasteless, like an insipid herring. It is, in fact, the levitation of the herring family."

SALMON ANGLING.—Editor *Forest and Stream*: There will be an opening for salmon angling during the month of August at the "Indian House Pool" section on the Restigouche for three rods. Extent of river some nine miles. I will be happy to furnish information.—ANGLING RESORT.

## Rifle and Trap Shooting.

### BRITISH MUSKETRY INSTRUCTION.

ORD WOLSELEY, on behalf of the Duke of Cambridge, Comd-in-Chief of the British Army, has issued some amended musketry instructions for the use of the soldiers of the regular army. They represent his views as gathered from his field experience, and ought to bring about a very sweeping reform in this department of a soldier's duties. The following summary of the orders from the columns of the *Military Record and Volunteer News*, of Glasgow:

The annual allowance of ball ammunition to be allowed for each trained soldier will be 161 rounds, and for each recruit, officer and man, in addition to the annual allowance, 100 rounds, so that in the year of his service every soldier will require to fire 261 rounds in all. The recruits' course will be conducted by the officers commanding companies, and each recruit will fire 10 rounds individually at each of the following distances: 100, 150, 200, 250, 300, 400, 500 and 600 yards, and 70 rounds in independent firing at 300 yds.; 10 rounds in volley firing, in extended order, one-half at 200 and the other half at 300 yards; 5 rounds in volley firing, in close order, at 300 yds.; and 10 rounds in skirmishing, between 400 and 500 yards, or in all 100 rounds per recruit. Over and above this preliminary training, the recruit will be treated as a trained soldier, and as such fire another 160 rounds, making up 261 rounds in all. Even our very best shots will think this a rather hard curriculum to get through in the time allowed. The marks of the recruits are determined that the soldier shall shoot as accurately as he can march, while it is quite as certain no relaxation will be made in his marching and drill parades.

After the recruit service, every trained soldier will have to undergo an annual course of shooting, divided into two parts. In the first of these parts he will be required to fire 100 rounds in independent firing at 100 yards standing at 150 yds., 10 rounds kneeling at 250 and 300 yards each, and 10 rounds each, any military position, at 400, 500, 600, 700 and 800 yards. In volley firing, 30 rounds will be expended, 5 at each of the following distances: 100, 150, 200, 250, 300, 400, 500 and 600 yards, and 10 rounds in independent firing, at 300 yds. and 10 rounds in independent firing, at 300 yds. In close order.

In the second part of the course, the soldier will be fired in field firing and skirmishing and private practice, and will be carried on throughout the year, under the orders of the district general, according to conditions and circumstances. These 20 rounds, it is suggested, may be used for repeating any portion of the first part of the course in the case of men who have failed to become fair shots; they may be used in individual practice at a "head and tail" target, that is to say, a single target plate laid on its side, four of the 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000.

After the recruit service, every trained soldier will have to undergo an annual course of shooting, divided into two parts. In the first of these parts he will be required to fire 100 rounds in independent firing at 100 yards standing at 150 yds., 10 rounds kneeling at 250 and 300 yards each, and 10 rounds each, any military position, at 400, 500, 600, 700 and 800 yards. In volley firing, 30 rounds will be expended, 5 at each of the following distances: 100, 150, 200, 250, 300, 400, 500 and 600 yards, and 10 rounds in independent firing, at 300 yds. and 10 rounds in independent firing, at 300 yds. In close order.

In the second part of the course, the soldier will be fired in field firing and skirmishing and private practice, and will be carried on throughout the year, under the orders of the district general, according to conditions and circumstances. These 20 rounds, it is suggested, may be used for repeating any portion of the first part of the course in the case of men who have failed to become fair shots; they may be used in individual practice at a "head and tail" target, that is to say, a single target plate laid on its side, four of the 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000.

### RANGE AND GALLERY.

CREDMOOR, May 9.—To-day was considered one of the finest in point of wind and weather for rifle shooting that has prevailed at Credmoor in the past. The conditions were so favorable that a series of competitors' matches were excellent. The ranges shot over were the 200, 500 and 600 yds., 7 shots each. The following is a summary of the day's work:

	200 yds.	500 yds.	600 yds.	Total
T. J. Dolan, Twelfth N. Y.	31	31	31	93
W. M. Farrow, New York Artillery	31	31	31	93
S. B. Bunnard, Second Mass.	29	32	33	94
George Joiner, Twenty-third N. Y.	29	32	33	94
H. J. Blandish, Sixty-fifth N. Y.	33	32	28	93
T. W. Wilson	31	31	31	93
John Smith, Twelfth N. Y.	31	31	31	93
W. M. Farrow, Twelfth N. Y.	31	31	31	93
"E. Thomas"	31	31	31	93
J. H. Blandish, Twelfth N. Y.	31	31	31	93
J. H. Blandish, Twelfth N. Y.	31	31	31	93
J. S. Shepherd, Twenty-third N. Y.	32	32	30	94
F. Stewart, Sixty-fifth N. Y.	31	31	31	93
S. B. Bunnard, Twelfth N. Y.	31	31	31	93
H. A. C. Long, Thirtieth N. Y.	31	31	31	93

May 12.—The last of the competitors' matches was shot this day at Credmoor under the direction of General Charles F. Robinson, executive officer. A greater number of competitors were present than at the previous competitions. The day was clear and warm. The wind at the 500 yds. range was light, though changeable. At the 200 and 600 yds. ranges it was very tricky. Considering the day excellent scores were made. The continued improvement in the scores that are being put up gives great encouragement to our rifleman, and certainly the victory in the coming match along a certainty. Below will be found some of the

spineaker and elaborate arrangements for reefing, lowering the mast, sink deck haps, ballast wot, stowage lockers, etc. Many other models, the Jersey Line, Sandy Hook, Princess, etc., etc., etc., combine the features of the above, but the latter is the only one that has the advantage of showing that a mere name, such as Nautilus or Shadow, now gives notice of the dimensions, model or rig of a boat without it is necessary to give a long and tedious description of the vessel, as the present types are by no means clearly marked, but merge into each other by small gradations. As the chances of each successive model being a success are small, it is better to give a name that will drop these names so long in use, substituting instead such divisions into classes as the Association have laid down, which will give a better idea of the type of boat than a comparison with model that is not clearly marked.

THE A. C. A. MEET.

STONY LAKE, the locality selected for the fourth annual meeting of the A. C. A., is situated in the Province of Ontario, about twenty-four miles northeast of the town of Peterboro, and is about five by ten miles in extent, the southwest part being filled with a cluster of islands. Near this end of the lake is the entrance to Clear Lake, a fine sheet of water with no islands.

A: At the northeast corner of the archipelago above mentioned, is Gun Island (the name will not be retained), the camping ground of the A. C. A. An ice-house has been erected on its northeast point and filled from the lake, ready for the campers. Com. Edwards and Mr. Tyson of the regatta committee, in company with a surveyor, visited the lake early in April, and laid out on the ice the courses for the coming regatta.

A half-mile paddling course was laid out along the east side of Gin Island, where the prevailing westerly winds will not interfere with a smooth course. An excellent sailing course has been laid out, one corner being at the northeast point of Gin Island, each of the other angles of the triangular course being marked by a small island, easily seen, so that no trouble from mistaking buoys need be apprehended. While the start and finish of the sailing and paddling races will be at the same place, the scenery about the camp is very pretty, and no less attractive could well be found.

Another large island southwest of Gin Island has been selected as the "ladies' camp," and a large gathering of them is expected. The Peterboro Boating Club are already preparing to give canoeists a hearty welcome.

Canada is doing all possible to make the meet a grand success, and our canoeists cannot begin too soon to prepare for August. Perfection in rig and fittings, training and practice in paddling and sailing, thorough discipline and drill on the part of club officers, will be needed to make a good showing before our neighbors in August.

MAPS AND CHARTS.

SO many inquirers reach us in regard to maps and charts that a few words concerning them will be in season just now. For the Atlantic and Pacific coasts, including the harbors and larger rivers, the U. S. Coast Survey charts are the cheapest and best. They are to be had of agents in all the larger seaport cities: Eggert's, 71 Wall street, New York; L. Thaxter & Son, No. 125 State street, Boston; Wm. Senter, No. 51 Exchange place, Portland, Me.; Riggs Bros., 101 Walnut street, Philadelphia, Pa., and of dealers in nautical goods generally.

rich goods generally. There are two classes—preliminary and finished—the former being issued as soon as an accurate survey has been made as an immediate aid to navigation, and the latter only after every feature of the locality has been noted. They differ only in amount, and not in degree of accuracy of the information given. Four different values are given for the preliminary charts, and five for the finished charts, five of which cover the Atlantic and six the Pacific oceans, with sub-charts on larger scales of the principal harbors; general charts of the coast, scales of 1:400,000 and 1:200,000, giving the shore line and the principal features of the coast; general charts of the coast and the Pacific oceans; coast charts, scale of 1:50,000 (3-10 nautical mile), giving every natural and artificial feature for several miles in-

land; and finally charts of harbors, bays, rivers and sketches of local dangers, on various scales. Among those most valuable to canoeists are Boston Bay, price fifty cents, Long Island Sound, three shillings, New York Bay, price fifty cents, and Long Island Sound, seventy-five cents, Delaware Bay and River, three sheets, \$1.50 each, and harbor charts of nearly all the harbors on the coast, prices about twenty cents each. The charts of the Hudson River, Albany, Troy, and the Albany plain, forty cents each, three of the Hudson from New York to Troy, forty cents, and of the Passaic, Raritan, Delaware and Schuylkill, twenty cents each, are all valuable to the canoeist. The charts show times and heights of high water at all points on the coast, is also purchased by the same department, price twenty-five cents. Maps of more than twenty of the larger cities and towns, and of all the counties of the country, for some of which, embracing the whole of the country to Eastern sportsmen and canoeists, the reader is referred to our advertising columns. Of course this season the topography of Canada and the United States, and the names of the cities and towns, are of some information concerning it later on.

## TANDEM CANOES:

IN answer to a correspondent we explain that this name has been applied to canoes carrying two persons seated one forward of the other, also known as double canoes.

Speaking of the two boats, Mr. Baden-Powell says: "The double-hulled canoe is a craft that is becoming exceedingly popular, not only for the purpose of carrying a large amount of cargo, but also for a good deal to be said in favor of a craft that will carry a man up a cruise and yet be not too large for one to manage in the absence of the rest of the crew. In the first place, the original cost is for one canoe, whereas the other is for two or three. It longer has more fittings, yet her crew should not grow larger. It is not so heavy as her 'keep, or 'housie,' by the year is for one canoe, so also her cartage, railway, steamboat and portage charges are for one canoe, whereas many similar points must be invoked to show that her working expenses are for those of a single, and very considerably less, than under those of two canoes.

"Two good hands could in traveling work the double-handed canoe nearly twice the distance in a day that two single-handed canoes could be worked in the same circumstances. At sailing in a reaching wind she would be faster than the short single; in lumpy water she would be able to carry her way on, and in calm or head wind both can pound and wear out the crew. The double-handed continued 'watch and watch' if need be, so that literally the double-handed canoe can be kept going on her course day and night with scarcely more hardship to the crew than is entailed in working a five-

"The heaviest weight should be in the forward seat, and then the 'light weight' and the baggage in the locker will bring about the correct balance. When it becomes necessary to jump out and shove off from the ground when running a rapid, it is the 'heavy weight' who should do so, and should do so from the fore end so as to prevent her swinging broadside to the stream."

The races both of the Association and the N. Y. C. C. in which two men were allowed in each single canoe have been among the most popular features, so much so that a number of canoes especially designed to carry two will appear this season.

**TORONTO CANOE CLUB.**—The Toronto Canoe Club invites entries for its opening REGATTA under the following conditions for a sailing race for canoes and skiffs on May 24: 1. Open to all canoes and skiffs, the owners thereof being members of any regularly organized canoe club. 2. The boats must be under 16 feet in length, and 16 feet for racing in "Class 4 of the A. C. A. Skiffs not to exceed sixteen feet in length, and three feet six inches beam, with a depth at gunwale amidships of not more than sixteen inches. 3. The "crew" of each boat must be a minimum of two persons, and only may be a member of a club as above. 4. Centerboard boats must be fixed and not more than four inches deep, and shifting ballast allowed. No limit as to area or number of sails. 5. Course to be from off the foot of Lorne Ave. to the island to place of starting. The committee will decide the route. 6. The race will start at 11 sharp. 7. The race to be sailed on

ording to the sang regulations of the American Canoe Association, copies of which may be obtained from the Commodore. S. The Executive Committee of the T. C. C. C. have the management of race, and in each case will give prizes proportionate to the value of the canoes.

The following dimensions of hull or canoe and nature of club, owner, and crew—to the Commodore, H. Nelson, Mail Building, No entrance fee. 10. Four prizes will be given. The first, a pocket watch; the second, a silver cup; the third, a pair of binoculars; the fourth, by S. Frank Wilson, of *Truth*; Bird, a camp bed, by P. G. Allen; and a fourth of proportionate value. The first T. C. C. canoe in will take the sailing challenge cup, now held by Mr. H. Tyson. A. A. will receive the rowing challenge cup, now held by Mr. J. W. Jones, and they will also compete for the second class challenge cup.

**THE STELLA MARIS.**—*Editor Forest and Storm*.—Among the editorial comments in the May number of the *American Criticist*, occurs the following item: "Even W.—that enthusiastic writer on the subject of the Stella Maris—has been misled by the heavy double canoe to launch her shadow." As this little *pandemonium* is evidently intended to give its readers the notion that the Stella Maris has been "weighed down" to ground waiting "as a crying call for aid," it is somewhat surprising to find that the same writer painted her; and that she has therefore been discarded as unsatisfactory and inadequate to her special purpose, a space in your columns is respectfully asked, in which to publish a full-length portrait of the vessel, under the name of "Mr. Atwood centerboard, balance her shadow." Was built as a double canoe expressly and solely for sailing in the deep and rough waters of the Atlantic Ocean, and was never intended to sail in shallow water, in which the little *Lily*, Stella Maris is not adapted, and never was intended to lie. (Any more than the heavy double canoe is adapted for frequent portages.) The "enthusiastic writer," in spite of the sixteen-foot draft, still thinks the Stella Maris the best cruising canoe built, and a magnificent performer in both power and speed. He writes, of course, in a somewhat unbalanced manner, but he is entitled to express his opinion. He cordially agrees with "J. M. G." in his remarks about small boats, and as to whether he intends to abandon the Stella Maris, he leaves that question entirely to you. But I think it is well, the best commentary on that text is the fact that Rushton is now building him—the "*E. W.*" aforesaid—a brand new Stella Maris, his entire summer cruise.—STELLA MARIS (New York, May 11, 1882).

**THE UPPER CONNECTICUT—Editor Forest and Stream:** You kindly permit the inquiry whether the water powers of the Connecticut River afford desirable facilities for a canoe voyage. I should like to know the season of the year, the best route, the current stream, and what distance can be traveled agreeably in regard to both scenery and stopping places, something of the number and extent of rapids, and the character of the country. I have a survey map of the river of recent date. Any information you experienced readers can communicate will be gratefully received, and I will be glad to send you a copy of the map. I am, Sir, Very Respectfully, Yours, C. F. Johnson, White River Junction, Vt. From that point there is no carry above Falls Falls, and there it is only a quarter of a mile. The Connecticut River is a fine canoeing river, and the scenery is very beautiful. The best hotel accommodations are to be found all along the way. The current is strong, making the trip down an easy one. We hope that you will communicate their information for our correspondent's benefit.

ENGLISH CANOEING.—The following is the programme of races of the Royal Canoe Club for the spring and summer: April 21, sailing race at Hendon; April 28, sailing race at Hendon; May 5, sailing race at Hendon; June 2, sailing race at Toddington; June 10, paddling race, Toddington to Putney; June 23, regatta at Toddington Reach; July 6, sailing race, Greenwich to Eritic; July 7, sailing race at Eritic; July 9, sailing race at Eritic; July 19, sailing race, Eritic to Greenwich. In addition to the above races the honours of the R. C. C. Club are at stake in the races of the Thomas Vane Sailing Club against cutboats and small sailing craft of various rigs, as will be seen in another column.

**PSYCHE.** Mr. Monroe arrived in New York on Monday last after a winter's cruise in Florida waters. The Psyche was launched from the steamer, and sailed to Staten Island for repairs.

# HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

OR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, DOGS, HOGS, AND POULTRY.

FOR TWENTY YEARS Humphreys' Homeopathic Veterinary Specifics have been used by Farriers, Stock Breeders, Hivory Stable and Turfmen, Horse and Cattle Manufacturers, Gun and Mine Companies, Trays, Hippodromes and all Veterinaries, and have been found, with perfect success.

Humphreys' Veterinary Manual, (30¢) sent free by mail on receipt of one percent.

## KYNOC'S

Patent "Perfect" Brass Shells,

MANUFACTURED BY

**KYNOCH & CO., Birmingham, Eng.**

These shells are made of extra fine thin plate metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be re-loaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two size larger than gauge of shells. Or can be effectively crimped with tool as represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

# AMERICAN Kennel Register.

A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the Register contained the pedigrees of 138 dogs.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the Register contain prize lists of Washington, Ottawa and Pittsburgh shows.

The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry blanks for each department will be furnished free on receipt of stamped addressed envelope.

TERMS:—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, AMERICAN KENNEL REGISTER, P. O. Box 2,883, New York City.

## Rare Opportunity?

## Great Sale of Colt Breech-Loading Guns for Summer Holidays.

In order to reduce stock, we will now offer our entire stock of Colt guns, not extension ribs, at retail for sixty days at regular wholesale prices. These guns are all sizes and qualities, from the twist pistol grip, \$35.00 list, to the Laminated steel or Damascus, \$9.00, 28 to 3 in. long, 7½ to 10 lbs. weight. Among the stock are a few of the celebrated Trap and Killing Guns. These guns are all made of extra quality of barrels, and are made with great care, especially for close and hard shooting, and we have never seen anything yet to equal them at long distances. Price lists sent on application.

## FISHCULTURE.

EVER since fishculture was undertaken in this country there have been doubters as to its utility. Notwithstanding the successes recorded and the great benefits that have been derived from it, these skeptics refuse to be convinced. A few days ago we heard a man say that shad in the Hudson would now be more plenty if none had ever been hatched there. His argument was, that if the fish were left alone they would spawn more freely and the unripe ones captured would ripen and cast their spawn. He was unaware that the eggs taken were from fish which would have gone to market and was really so much saved, and that of eggs cast in the natural manner not one in a thousand hatched.

The same thing has been said about the salmon and the trout. The latest thing that we have noticed is a statement from a professed fishculturest, which has been widely copied, and as it pretends to come from a "United States Fish Commissioner," it seems to have the stamp of authority. The item in question we have seen in the *Cape Ann Advertiser* and the *Belfast, Me., Republican Journal*, both papers devoting much space to fish matters. It says:

"United States Fish Commissioner M. P. Pierce is not a believer in fishculture. He says the Delaware and all the large streams north of it emptying into the Atlantic were natural salmon streams at the time the country was settled, but the clearing off of the forests and tilling of the land has rendered the waters warm and muddy, whereas when frequented by the salmon they were clear and cold. The same is true of the trout streams. To attempt to restock the streams with these fish at a great outlay of money is a mistake. The labor and expenditure are almost a total loss."

In the first place, Mr. Pierce is not a commissioner of fisheries, either of the United States or of any State. He has made some carp ponds and has taken an interest in fishculture to the extent of making speeches before the legislatures of Pennsylvania and New Jersey, in which he has opposed any appropriation being made for the use of the Commissioners. Why he has done this is best known to himself,

although the Commissioners of those States impute selfish motives to him.

His statement that the Delaware, and streams north of it, were salmon streams is also wrong. No stream south of the rivers of Connecticut contained salmon at the discovery of the country; but the Delaware was stocked with a few salmon some years ago, and a few fish have since been taken in it, enough to show that with liberal stocking it can be made to produce salmon.

There is one thing that is certain. Fishculture has too many grand successes to point to in America to fear being discontinued because a few skeptics or disappointed men throw stones at it. The moon is a grand success, and continues to shine, no matter how much barking is done at it.

## THE SELECTION OF THE TEAM.

THE theme of all talk in rifle circles and among the outside public as well is the action of the directors of the National Rifle Association in shutting W. M. Farrow from the roll of members of the team of 1883. There is much to be said, pro and con, in regard to the act, but after all the bald fact remains that one of the best marksmen in America, if not the very best all-round shooter we have, has been shut out from a chance of adding his strength to the team, and only because some of those in power have personal spites which they wish to work out in this petty fashion.

The facts of the case are simple, and all the muddle of explanation which may be thrown about them will not change the general impression that a gross act of injustice has been done, and the American motto of fair play and the best man to the front set at naught. Mr. Farrow has been for years a member of the Newport Artillery, an organization of the Rhode Island militia. He competed a year ago at Creedmoor for a place on the team of last year, and at other matches under the control of these same directors has appeared in the uniform of his corps and won prizes. It is nonsense then to claim that he was not well known to the Creedmoor officials as a National Guardsman. Yet he was shut out from leading his valuable aid to retrieve the defeat of 1882 on the flimsy pretext that the directors had not been made officially aware of the fact that he was a member of the citizen soldiery.

The clause under a twisting of which the directors shut off Mr. Farrow is No. 10 of the "Regulations for the Selection and Government of the American Team," which says:

10. Each person entering for the competition at Creedmoor shall be required to produce a certificate from the Adjutant-General of his State, stating that he is and has been since January 1, 1883, a member in good standing of its uniformed National Guard or militia, and is a proper person to represent his State on a team.

Was Mr. Farrow required to produce any such document? No. Instead, this very matter was brought up at the first conference of the embryo team and the committee, held at the club house on the range on the morning of May 14. The fact was then noted that not only Mr. Farrow but several others of the shooters had neglected to provide themselves with such papers, and then and there, with the full knowledge and consent of the committee, this requirement was waived. Had the committee felt inclined to insist upon the display of a certificate, then was the time and that the place, before a shot had been fired. But no. Here was instead a capital chance of playing a sharp trick and profiting by their own questionable device. Mr. Farrow was lulled to the belief that such a palpable, useless precaution was not to be enforced, and when a week's good work had been put in, giving Mr. Farrow the best average of any man in the two dozen picked shots competing, when it became more than ever evident that he was really needed on the team, then it was that the little technicality dodge popped out from behind the fence, and Mr. Farrow became aware of the fact that he was the victim of something very much akin to a conspiracy.

There is talk of securing harmony on the team by the rejection of Mr. Farrow, and it is undoubtedly true that that gentleman in the past has figured in many disputed cases over the interpretation of match rules. He has also a very inconvenient way of looking a gift horse in the mouth, and this is an unpardonable offense to a company of managers, whose five-dollar trinkets appear as twenty-five-dollar trophies on the shooting prize list. In many similar ways, Mr. Farrow has incurred the lively displeasure of many of the rifle magnates, and for this he has been punished when the opportunity offered, though it does appear a great deal like splitting the face by cutting the nose off. It has never yet been shown that Mr. Farrow has ever done anything which was contrary to gentlemanly conduct, and an exercise of an

American independent course of action. He has pushed his way to the very front rank as a marksman by hard and intelligent work. He is to-day thoroughly conversant with the theory and practice of rifle shooting, and his omission from the team is a real loss. There was nothing to show that he was not actuated by the best and most patriotic motives in giving his time and effort to win a place. There is no reason either to fear that he would not have made a good working member of the team, but with some old scores to settle and a chance to strike down a man who might have carried a particular ride to the front, he has been sacrificed, and the squad of riflemen go abroad, not as a representative team chosen by a fair and open selection according to merit, but instead a few riflemen who find favor in the eyes of men placed in positions of trust.

There is a very bad air about the whole matter, and its tendency will be to check newcomers from taking an interest in range practice. Merit, it would seem, is not to be recognized, and it is as much a fault, it would seem, to shoot too well, as it is to shoot too poorly. The rejection of the best shot in America from a place on the team may be looked upon with favor by some of the English shots. It certainly is a step toward giving the British team another victory. A year ago it was pretty well understood that the visitors were to win, and some of the private letters sent over by the English managers before the match, would be very interesting reading in this connection. But it certainly cannot be the plan of our so-called American managers to throw another match into the hands of the Wimbledon experts.

It remains to be seen whether the other members of the team will retain their places on a body from which one of their companions has been so rudely pushed. There surely ought to be sufficient regard for fair and honest endeavor to see to it that a snub, and a very emphatic one, is given to such a contemptible little potflogging trick as that which cut Mr. Farrow from his hard-won place in the first eight of the American team. No rifleman can in the future tell what trap may be sprung upon him after he has done all the work before the butts which may be required, and a more flimsy curtain to hide behind than the one chosen by the majority of the committee on this international match, it would be difficult to imagine.

There is fault on both sides of the controversy, but no petty failings on the part of an individual can be for a single instant regarded as offsetting the worse than blunder committed by the directors in their star-chamber proceedings.

FISHING ON SUNDAY.—Mr. Benjamin Vaughn Abbott, who was secretary of the Commissioners on the Code, and who drafted the Sunday sections, is quoted by the *Observer* as saying: "Section 265, on sports, is substantially a transcript of a law which is fifty years old. The effect of section 259 of the code does not seem to me to have been sufficiently considered. It really restricts all punishments for violation of either of the following sections, to cases sufficiently aggravated to be pronounced by a judge and jury 'serious interruptions of the public repose and of religious liberty.'" If Mr. Abbott is correctly reported these may be accepted as the principles upon which the framers of the law intended it to be construed. It will be seen that considerable latitude is allowed to those who choose to "be quiet, and go a-angling." They may fish, but must not make a noise about it and so disturb "the public repose." This reading of the statute, we take it, would not forbid fly-fishing, for the lure which falls upon the water lightly as a feather would not disturb this repose; but concerning bait and line fishing there might be a very nice splitting of hairs, and we are prone to think that the man who *chugs* his bait into the stream would be ruled out. Again it is clearly not permissible to pursue the fugitive herring over the hills, with horse and hound and hunting horn, as at Newport, nor to follow with hue and cry the ancient whitefish, as in certain sections of Canada. Perhaps there was just such a law when the "Compleat Angler" was written, and it was to those who thought themselves oppressed by it that Walton left his parting injunction, "Study to be quiet."

THE IDEAL VIEW of the New York and Brooklyn bridge, which is opened to day, would show a tangled skein of fishing lines dangling down into the turbid waters of the East River, with multitudinous nonsters ascending. We have seen no statement from the bridge trustees respecting the future angling privileges on the structure. It will now be in order to petition the authorities for permission to fish from the bridge. The only drawback to this scheme is the fact that there are no fish to be caught.

## The Sportsman Tourist.

### QUIET SPORT.—IV.

BY MILLARD.

ABOUT four miles north, "bearing a little west," lies another and a larger lake, where "solitary and alone" live a quiet couple, Uncle Philo and his wife, whom every visitor is licensed to address as "Aunt." The lake affords no sport for the fly-fisherman, but the trolling is good, and many large catches are made in that way. The outlet of the lake, however, offers trout and black flies in generous quantities, and the biggest bungler with rod and reel can catch as many of the latter as the most finished expert.

Dick and Glen sighted the log house of Uncle Philo a few minutes before dinner time. Philo was hard at work following a plow which was pulled most steadily by jacks in fashion by an old black horse which the crows were waiting for. He was breaking, or trying to break up a patch of ground which he had cleared and was going to "put it into 'taters'" if he and the horse ever finished plowing it. It was getting to be a serious question which got broke up first—the land, the horse, or Philo's voice, for the old Rosinante's ears were continually filled with "Git up, cousin ye, ye lazy creeter, git up," which was the extent of Philo's horse profanity, but repeated so often that the horse rather liked it, and apparently was always waiting for it and dying to hear it.

Aunt's call to dinner was a welcome one to all of us. "We was looking for ye boys. Expected ye on yesterday. Sit down; sit down."

"Well, aunt," says Glen after dinner was over, "you have not forgotten how to prepare a first-class dinner at short notice, and speaking of dinners, Uncle Philo, can you lend me the cone of your razor, for I don't know when I shall have such another chance to slick up."

"Sartin, yes; if you can make it go. Here it is, but I calculate you'll have ter touch her up a little for you can use it."

"Thank you, Uncle Philo. I'll touch her up a bit this afternoon before I go down the outlet."

After Glen had finished his shave, or scrape, and lounged about the house for an hour or two, he and Dick went down to the falls. The falls were a fine sight, and the plunge below fairly entering the outlet, and plunge is what the water does, making summer music as it rushes over on the off side and having sport when it strikes below, makes a beautiful pool on the high side and surrounded with immense rocks covered with cushions of moss, while on either side is a perfect jungle of undergrowth, making it necessary, to fish the pool, to climb one of the afore-said rocks, a feat which Glen presently accomplishes, though choosing one of the outer ones where the trout could not see him and from which he opened hostilities, the rod in his hand working with the accuracy of a mathematical instrument.

He was one of Charles Reade's either-hand men, and his care in preparation extended to the minutest detail, so when the battle opened he was ready at every point. He was never headstrong, never letting his zeal outrun his discretion, but patient and undisturbed as a sphinx. He will always manage well enough, and even if the trout escape, he will give no sign of it, but if he catches one, he matter how keenly he may feel it, for he is an iceberg in coolness.

At the second cast the selective fish has done its work, and now, old rod, to business. Hump! two ounces at least, and not an ounce less. Little fellow, you may go home, and please tell the old gentleman there about the nice visit you have had, how sorry you were you couldn't stay longer, and how splendidly you were treated by the pleasant friend you met. Give my compliments to your big sister, and tell her how pleased I should be to see her. Good bye, Splash!

What a retentive memory the two ounces had for such a youngster, and how he must have embellished the story of his travels as he told it with his fluent tongue, for in a few seconds came another, many times larger and older—one with a great deal of rapid transit about his style; but he was struck at sight, which is the flash of the trout. You may miss him, but you will not miss him long, his chances of escaping, Glen believes, are greater than if he met him the better part of half way. He can let go very quickly.

Every angler has his pet theory regarding the twist of the wrist or turn of the hand, and the proper time to put it in practice, but as Glen says he was taught to strike at sight, it has become second nature with him, and as he can capture rather more than a fair proportion by that method, he is not going to sacrifice it. He is going to break that trout up in business, that's what he will do.

That poor trout is a victim of misplaced confidence. Oh, how could Glen do it? He did it with rod and reel, with silence and celerity. Did it because he loved it, and the trout, bowing to the inevitable, in ten minutes by the watch and chain, was creeling, and slept with us in sections that night. He was a good one. "Solid-mated, game; no livered slogger, no hot-house product, tame and insipid, that awaited like a prize pig for his food to be brought to him, but he was an active sportsman, a warrior bold that had conditioned himself by buffeting the riffs and currents and battling among the eddies for his morning and evening meal."

Into the basket went he, while Glen glew with a quiet glow of satisfaction. One's whole after life might be void of such pleasurable emotions. Even a yes that ends a wooing might be tame in comparison. To one you can always look back with a longing, self-repenting, "If the other—well, we have heard old married people say if they were to do it over again they wouldn't do it."

Glen was contented when he had landed a dozen that a Christian sportsman need not be ashamed of displaying. In capturing the dozen he had taken some smaller ones, but scrupulously returned them. There was not the slightest particle of the "T. H." in his composition, and he could unblushingly exhibit the contents of his creel if he cared to show the results of his angling skill.

How the black flies had taken hold while Glen was too busy to accord them the reception they merited, and they had improved their opportunity of displaying their infernal tactics on his cleanly shaven face.

The black fly season at that particular locality was unprecedentedly active. They all were spurs, carried red-hot needles, and stuck closer than the scriptural brother. The millions of black flies that swarmed and sucked a hundred years ago are represented to day by descendants worthy to inherit their devilish propensities and proclivities. There has been no degeneration in the stock, for, utterly and hein-

ously depraved, without an apparent redeeming quality, they maintain the old reputation and carry on the business as originally established.

Uncle Philo and Aunt were waiting supper when Glen returned.

"Massy, sakes alive! Mr. Glen, but how the pesky flies have lit out you."

"They did rather manage to get in their work to their good advantage while I was on the rocks below the falls; but that's all right, as it was my fault."

"Your fault?"

"Yes, for I had a bottle of tar and oil but I forgot to apply it, so the insects in a measure my own. Oh, how I have bleated and unconsciously suffered, if such a thing be possible, the torments of the damned while handling the rod. Suffered when I had in my pocket the remedy to alleviate the pain, but all forgetful of it in the delights of casting the fly and making the ripples and quiet pools contribute of their treasures to my creel. Put me on a runaway watching for deer, and if there is one fly about he will demand and secure my attention spite of all the deer within five miles."

"Don't you think, Mister Glen, that giving yourself a nice, clean shave was what drew them to you? Dick ain't scarcely touched."

"That, I think, made no difference."

"Did you find the razor in good order?"

"Not first-class, but I touched it up on the grind-stone, and finished off on the stove-pipe. I was very careful not to nick the stone. It shaved me, but it pulled terribly hard. I say, Uncle Philo, would it be a good idea to hitch it up with your old black horse and do your ploughing with the two?"

"If your horse can pull as well as your razor, you will have a team that can walk through every stump in your clearing. But Uncle Philo, I am much obliged for the use of it, and Aunt, that is what I call a way up supper, one of the kind I firmly believe in putting down."

"So said we all of us."

Before the purple tints in the west had faded away, the rest of the Scout, his Club house and our last night's temporarily broken camp at headquarters, and Uncle Philo's cabin was filled with a sociable party.

### DAVE'S MEDICAL EXPERIENCE.

IN a former communication\* we wrote that poor old Davey W. had paid his last debt—we might almost have written his first and last. He was a rare genius, and his name still "blossoms in the dust" of the Yazoo Valley, at least when there is no overflow upon its fertile fields; for even as we write, through broken barriers the great Father of Rivers, as he sweeps ever southward to the blue Mexican sea, rolls in surging waves over our lonely grazing small in stature, neither strong nor muscular, and with a somewhat "determined" stoop of the shoulders, he appeared at rather a disadvantage among the stalwart raftsmen of the Swamp. It was only when around the camp-fire, while from briar-wood and black "dudder" the fragrant breath of the Indian weed curled upward to the blinking stars, that Dave towered above his fellows, a veritable Anak in the fields of common-sense. Although he was generally the hero of his own story, so to assuming was his manner, so self-deprecating his voice, that one never thought of him as a braggart.

His face had perhaps "once been fair," but was when I knew him tanned and weather-beaten. His eyes were yellowish gray in color, with that far-off, dreamy, Indian-southern look that is always associated with peace and contentment, and so slight was the division which his nose made between them, that they seemed almost to run into one another. His hair had once been red, and, with the exception of a whitish patch on the top of his head, was still of a muddy, fox-tail hue, while his beard was tawny and bristling, and each individual hair stood out fierce and defiant like the spines upon a cactus. It knew no north, no south, no east, no west—a kind of "political" beard, as Dave once said of old Sol's rife's pocket compass, "pointing to every tree in the woods." Here I am reminded that Dave would never carry one of these "useless contraptions," as he called them, depending, as many old hunters do, upon the moss and bark upon the trees for guidance, when skies were "ashen and gray."

After Dave had finished the story of his encounter with the "Dutch Yawger," as before related, Ben H. proposed that we should go upon a camp hunt up on "Six-Mile Bayou." To that Dave and myself assented, and having agreed upon starting the next day, we separated.

Bright and early the next morning saw us assembled at the appointed rendezvous, with our "camp tricks" and a darkey commissary on the roof of an extra mule.

Taking our course along the eastern bank of the Sunflower, we crossed that stream at Callao, the plantation of Col. Harvey L. And here, if it will be permitted me, I would like to make slight digression. Presuming that some of your Northern readers may be ignorant of what were the qualifications requisite for the acquiring of military titles among the planters of the cotton States in ante bellum days—titles so innumerable, that had a modern Napoleon, as No. 1 did when he got Moreau at Eylau, ordered a few shells dropped among he, would have bagged a "little general" at every pop—I will for the benefit of the future historian state, that they were bestowed in accordance with the number of cotton bales upon which the individual planter stenciled his brand. Be it understood, however, that there were no captains "in those days." The shipper of his five score bales never ranked lower than Major. When the packages of the fleecy staple reached to double that number he was promoted to Colonel, and when he rolled the comfortable figure of 500 out of his gin house, it was "Glad to meet you, General." If there were "brevets" for the intermediate numbers, the writer knew not of them, unless, perhaps, it was "Judge."

Having crossed the river, we continued our course up its western bank, and in a short time struck the Deer Creek trail, following which a few miles brought us to the confluence of "Four-Mile Bayou" and the swift-running Bogue Plalala. Forging the latter stream we soon found ourselves traveling along the bank of a dry bayou, the land upon both sides of which lay in long swelling waves covered with tall grass and a scattering growth of trees, with here and there small islands of cane upon a more elevated point. As these lands are subject to annual overflows from the local streams, they remain in all their wild, uncultivated beauty, and are favorite feeding grounds for deer, which could always be found in abundance; until driven to the higher cultivated lands by the past year's disastrous overflow they have been almost exterminated by the "gentleman from

Africa." Pitching our camp near a clear pond that slept in depression of the bayou bed, our camp-fire soon shone brightly through the gathering twilight, while around it flitted our sable commissary preparing the evening meal. This disparted and enjoyed, as such meals always are, we sat awhile in silence while the white wreaths from our lighted pipes as they rose slowly upon the damp night air, each, perhaps—as our sweethearts used to write they were always doing—"following the lead of his wayward fancies."

At length, having doubtless looted his game, Ben H. broke the spell with, "I say, Dave, don't it sometimes make your mouth sore for those long-winded yawns you tell to come out when you're asleep?"

"O, no," Dave replied; and then very solemnly, as if the question has conjured up some sad memory of the past, he continued, "but if you want hear it I'll tell you all 'bout one sore mouf I did have wunst."

"Out with it, then," said Ben, "if it won't make your mouth sore again to tell it."

"O, no danger o' that; it twan't talkin' as done it that time, no how," said Dave, and, relighting his pipe, he went on, "You see, 'twas while I wase a livin' down at the mouth o' Murphy; one day Shot Dupe he come along an' he hisself down on a log whar I wase a fishin' an' begin a-tellin' me as he'd a-went down ter Ditchal's last Sunday an' a-cached a thousan' peaches outen one hole, an' narrer one on 'em wus er bit bigger nor er bit littler than tother one."

Here Ben interrupted him with, "And I suppose you believed all such stuff as that?"

"O, no," said Dave, "I didn't edactly believe as to they bein' no our same size. But as I wase a sayin', there wos a fishin' an' Shot a-talkin', when I looks up the river an' I seen er fellow comin' down in er skiff. 'It's one o' them pill-pedders,' says Shot, 'an' now's yer chance, Dave,' says he, 'for to lay in yer doctor's grub, an' bein' as yow's lookin' mighty puny o' late,' says he, 'I think you oughter take in er year's rations an' somethin' extra for Christmas.' Well, sure enough, when the feller landed he had his skiff full o' all sorts o' powders an' pills an' stickin' plaster an' such like, high outen about twenty bushels, Shot said. Well, what does I do, with Shot a-sayin' all the time, 'Buy this yer, Dave,' an' 'Here's the stuff ter set you up, old feller,' but I lays in a general assortment, ten dollars' worth o' therabouts, an' with what the feller throwed in for good measure makin', as high as I can come at it, about er bushel an' er half."

"Well, twant mon'ten days or two week maybe. I was taken with a cramp in my left stomik, an' thinks I, Dave, old feller, you're lucky this time, you've got plenty o' sick grub in the house. Well, I jest shiet my eyes an' I run my han' down in the chis' sorter cache like an' up I fetched er little box which were pills all a-ced jest like a weddin' cake. But they didn't seem to understand the business, so the next day I fetched up some kind o' yaller powders, an' I tooken about a three-finger load on it, but it didn't cure nothin' like I thinks I wase gettin' serious, so I pitched in kinder indiscriminate like, an' in about a week, as sure as yow're alive, the whole o' that physic jest sailed down my wessan."

"That is what makes your eyes look so much like the windows of a drug store," said Ben.

Unheeding the interruption, Dave continued:

"Well, by that time my mouf had got so sore that I don't think I could a swallowed another pill if the supply hadn't a gived."

"Just about that time George Booker, he come along a blovin' up the river, so I runs out on the landin' and I sorter motioned for him to fetch her in, for I coulnd a spoken outen a whisper if I had a wanted to say my prayers. So when George he sed me a workin' my arms he landed her an' I went aboard. An' says I, 'George,' says I, in a whisper, 'I 'en' a' moutful for cmostest or mouf.' Says he, 'What in the world is the matter, Dave?' Says I, 'God only knows what is the matter,' an' then I ups an' tells him 'bout that pill-peddler, an' how much doctor's grub I'd tooked. 'Oh,' says he, 'you're salivated.' Says I, 'that might a bin his name as far as I knows, but anyways he's about fixed me.' Then George he says how I must go down to Vicksburg an' see er doctor. Well, I puts on er clean shirt an' down I goes, an' when I gets there the first thing I does I goes straight up to old Ben Barkaway's medicin' shop, an' I begin a whis-perin' at him as wher's er doctor. 'Oh,' says he, 'you're salivated, come here an' take er drink o' selleraapperin.'"

"A drink of what?" said Ben. "I never heard of that brand before."

"O, 'twant spirits," said Dave, "twas some kind o' salt an' water stuff."

"O, yes; seltzer aperient," said Ben. "Go on."

"O, right," says I, "it 'will make me appearin' any better, for I knows I'm 'buckin' right bad,' says I."

"Jest then Doctor Bulver he walks in the sto', and old Ben says he: 'Doctor Bulver, here's one o' the biggest cotton planters on Red River badly salivated, an' I want you to do your level best on him.' Then the Doctor he jest 'adds me to come in the back room, an' when we got in there says he: 'Please open your mouf, my friend.' Then he shuck his head, an' says he, 'Yes, I 'en' a' moutful, but I wase a taken about forty pouns o' hydrargum in broken doses, didn't you?' Says I, 'God only knows what I didn't took.' Well, then he tells me ter shut my eyes an' lay down flat my back on the table, an' then he hollers ter old Ben ter fetch him er pint o' aggyforty, an' the first thing I knowed he'd a gapped my mouf wide open an' a poured every drop o' that aggyforty down my goozle. Jerusalem, my happy home! er cup o' red hot bilin' lead poured down a patient to die it, outen my eyes the blue flames wus jest a-blowin' outen my mouf about ten feet high, clean up to the ceilin' o' the sto'. It jest burnt me out cleaner's a holler log, an' I never heers tell about sore mouves since I drunk that aggyforty, but I thinks about that pill pedder."

"I wish," said Ben H., "we had a pint of that aggyforty to start our fire in the morning."

Dave lifted his eyes inquiringly to the speaker, but if he saw anything the writer stretched upon his blanket with his feet to the fire and his head pillowed upon his saddle, was too far off in the land of dreams to hear him.

THE YAZOO RIVER, Mississippi.

CLEVELAND, O., May 13.—Killed thirteen snipe May 10. Did not weigh them, but were the fattest birds I ever saw. Oil would drip from the hands while dressing them, and though the water was very high, the washed in, the thick layer of white fat nearly all over them. Noticed embryo (?) eggs in some, about as large as mustard seeds. These birds were in an out of the way place and had, probably, been undisturbed for some time.—SCATPE, SCATPE.

## Natural History.

### NOTES ON THE BIRDS OF ALABAMA.

BY A. M. R.

**DURING** the summers of 1880 and 1881 I was afforded excellent opportunities for observing the birds of Alabama, the first season being spent mostly in the north and the second in Montgomery county. I thus had a chance to see something of the avi-fauna of the two extremes, and the following rough notes are the result of my observations. Through the information of friends I have been able to add some remarks on the winter species.

Wood Thrush—*Hylocichla ustulata*.—Common in the mountains of the north; not common south of Birmingham.

Robin—*Turdus migratorius*.—Very abundant in winter; rather uncommon during the summer. A nest and four eggs were found in Montgomery in 1879.

Brown Thrush—*Harporhynchus rufus*.—Common throughout the State. Found breeding in the north during the month of June. Local name sandy mocking-bird.

Mocking-bird—*Mimus polyglottus*.—Everywhere very abundant. Found breeding in the north in June. A favorite position for the nest is in the thick mock-orange bushes. Three to six eggs form the complement.

Calbird—*Geothlypis carolinensis*.—Abundant. Found breeding near Birmingham as late as July 1.

Bluebird—*Sialia sialis*.—Common. Young very abundant in June.

Blue-gray Gnat-Catcher—*Polyptila cyanea*.—Common everywhere, but most abundant in the lowlands of the south. Several nests found on Lookout Mountain. The gum tree is a favorite building site.

Tufted Titmouse—*Lophophanes bicolor*.—Occasionally met with throughout the State.

Southern Titmouse—*Parus atricapillus*, var. *carolinensis*.—First met with on the southern slopes of Lookout Mountain; it was quite abundant, and at that time (June) gregarious; rare in the south. It very much resembles the black capped titmouse.

Brown-headed Nuthatch—*Sitta pusilla*.—Only one specimen observed during two summers, and think that it is quite rare. The specimen I have referred to was seen near Birmingham.

Carolina Wren—*Thryothorus ludovicianus*.—Occasionally seen throughout the State; young birds obtained near Montgomery in July.

House Wren—*Troglodytes aedon*.—Most common in the north, but met with throughout the State; breeds.

Black and White Creeping Warbler—*Mniotilta varia*.—Everywhere abundant; breeds.

Blue Yellow-backed Warbler—*Chloris americana*.—Several specimens obtained near Montgomery; none seen elsewhere.

Prothonotary Warbler—*Protonotaria citrea*.—Sparsely met with in the swamps south of Montgomery.

Pencee Warbler—*Helminthophila peregrina*.—Several males obtained in the extreme north; not seen elsewhere.

Summer Warbler—*Dendroica aestiva*.—Everywhere common; breeds.

Prairie Warbler—*D. auduboni discolor*.—Extremely abundant throughout the State, frequenting pine woods. A nest and three eggs found in the extreme north in June. It was placed on an older branch overhanging a small stream, and greatly resembled that of the summer warbler.

Golden-crowned Thrush—*Sorus auricapillus*.—Occasionally seen in the north.

Water Thrush—*Sorus naevius*.—Everywhere common, especially in Montgomery county, where it breeds in great numbers in the swamps.

Maryland Yellow-throat—*Geothlypis trichas*.—One specimen seen a few miles north of Montgomery; nowhere else observed.

Yellow-breasted Chat—*Icteria virens*.—Everywhere abundant. Near Montgomery nests and eggs were found as late as July 1. Local name, French mocking-bird.

Redstart—*Setophaga ruticilla*.—Rarely met with; one specimen seen in the north.

Scarlet Tanager—*Pyrranga rubra*.—Occasionally seen in Montgomery county.

Southern Red Bird—*Pyrranga aspera*.—Everywhere very abundant; in the extreme south they are even more numerous than the cardinal grosbeak. Strange to say, I found no nests, nor could I hear of any, though the young birds, in their varied plumage, were very plentiful in June and July. I frequently noticed these birds darting after flying insects in the manner of the flycatchers.

Barn Swallow—*Hirundo erythrogastra*.—Everywhere common, nowhere very abundant.

White-bellied Swallow—*Ptychopterus bicolor*.—Occasionally seen on the Alabama River.

Bank Swallow—*Cotyle riparia*.—Common; breeds.

Purple Martin—*Progne subis*.—Most abundant of the family; bred in colonies in bird houses erected for the purpose. Nesting season, May.

Red-eyed Vireo—*Vireosylva olivacea*.—Occasionally met with throughout the State; only species of the family observed; breeds.

Loggerhead Shrike—*Lanius ludovicianus*.—Common north and south; a nest and three young birds found near Montgomery in June.

Field Sparrow—*Spizella pusilla*.—Abundant; eggs collected in the north in June, and near Montgomery as late as July 4.

Chipping Sparrow—*Spizella socialis*.—Common; breeds.

Star Sparrow—*Melospiza melodia*.—Abundant; breeds.

Swamp Sparrow—*Melospiza pulchra*.—Common in swamps; breeds.

Yellow Bird—*Chrysomitris tristis*.—Common.

Snow Bird—*Junco hyemalis*.—Common in winter; observed throughout the winter of 1875-76.

Blue Grosbeak—*Guiraca caerulea*.—Common in the swamps of the south. Nest and young found near Montgomery in June. This is one of the most beautiful of our Southern birds.

Indigo Bird—*Cyanospiza cyanea*.—Abundant; breeds. This is the most persistent singer, remaining perched on some high branch and enduring with indifference the heat, which has long since driven all other bird life into the shade.

Painted Bunting—*Cyanospiza ciris*.—Rarely seen.

Cardinal Grosbeak—*Cardinalis virginiana*.—Everywhere very abundant; many nests found. The eggs of this species

differ greatly, some being of a dark chocolate color and others of a light brown.

Bobolink—*Dolichonyx oryzivorus*.—Most abundant in the north, but occasionally seen throughout the State. During the winter they are found in vast numbers in the south. Local name, reed bird; breeds.

Cow Bird—*Molothrus ater*.—Occasionally seen throughout the State; no record of its breeding.

Red-winged Blackbird—*Agelaius phoeniceus*.—Common in the north; not found in any numbers south of Birmingham; breeds.

Meadow Lark—*Sturnella magna*.—Uncommon in summer; very plentiful in winter.

Baltimore Oriole—*Icterus baltimore*.—Occasionally seen; by no means common.

Orchard Oriole—*Icterus spurius*.—Everywhere abundant; many nests and young found near Montgomery in June. A curious instance of this species nesting in a martin box came under my notice. The young are ground-feeders in summer.

Crow Blackbird—*Quiscalus purpuraceus*.—Common in the north; rather uncommon in the south; breeds in the north. Found everywhere in the winter.

Crow—*Corvus americanus*.—Not often seen south of Birmingham; common in the north. Abundant in winter.

Blue Jay—*Cyanus cristatus*.—Very abundant. Breeds in the pine woods.

Kingbird—*Tyrannus carolinensis*.—Everywhere common; breeds.

Great Crested Fly-Catcher—*Myiarchus cinerascens*.—Everywhere very abundant. I found it in great numbers in the cypress swamps of the south.

Pewee—*Sayornis fuscus*.—Common; breeds.

Wood Pewee—*Contopus cyaneus*.—Occasionally seen in the north; not observed in Montgomery county, though I was shown numerous eggs collected in the vicinity.

Whippoorwill—*Antrozous vociferans*.—Occasionally seen in the thick woods. Breeds near Montgomery.

Night Hawk—*Chordeiles virginiana*.—Everywhere very abundant; about the last of August they are in fine condition and afford much sport to the hunting community; known throughout the south as the "bull bat"; breeds.

Chimney Swift—*Chaetura pelagica*.—Abundant; breeds.

Scaly-throated Humming Bird—*Trochilus colubris*.—Plentiful; breeds. The terror of hawks and crows.

Belted Kingfisher—*Ceryle alcyon*.—Common; breeds.

Yellow-billed Cuckoo—*Coccyus americanus*.—Sparsely met with all through the State. Locally known as the "rain crow"; breeds.

Black-billed Cuckoo—*Coccyus erythrophthalmus*.—One specimen, a young male, obtained about fifteen miles south of Montgomery; the only one of the species seen.

Great Ivory-billed Woodpecker—*Campylorhynchus priapeus*.—Common in the mountainous region of the north. Local name, woodcock.

Hairy Woodpecker—*Picus villosus*.—Several specimens obtained in the north, and it is probably found throughout the State, though I did not notice it in the south. Local name, "sapsucker."

Downy Woodpecker—*Picus pubescens*.—Everywhere abundant, especially in the pine woods of the south. Locally known as the "little sapsucker."

Red-bellied Woodpecker—*Centurus carolinus*.—One specimen obtained near Birmingham.

Red-headed Woodpecker—*Melanerpes erythrocephalus*.—Very abundant. A favorite breeding place is in the dead trees in the midst of the cotton fields. I have counted as many as four nests in one of these trees.

Golden-crowned Woodpecker—*Colaptes auratus*.—Sparsely met with throughout the State; abundant in winter. Local name, "yellow hammer."

Barred Owl—*Syrnium cinereum*.—Common near Montgomery; breeds in the pine woods about the city. I obtained many specimens of this fine bird, one of which I kept alive for some time. It was perfectly blind during the day.

Red Owl—*Scops asio*.—Common.

Pileon Hawk—*Falco columbarius*.—Seen in considerable numbers throughout the State.

Sparrow Hawk—*Falco sparverius*.—Common; breeds.

Sharp-shinned Hawk—*Accipiter fuscus*.—Occasionally seen in the north.

Cooper's Hawk—*Accipiter cooperi*.—Common; breeds.

Bald Eagle—*Haliaeetus leucocephalus*.—Occasionally found among the mountains of the north; said to breed on Lookout Mountain.

Turkey Buzzard—*Rhynchophanes aura*.—Everywhere abundant, acting as scavengers. Instances are reported of their having attacked young lambs and sickly sheep; breeds in great numbers on Lookout Mountain.

Black Vulture—*Cathartus atratus*.—Often seen, generally in the south; by no means so abundant as the preceding species; breeds.

Carolina Dove—*Zenaidura macroura*.—Abundant. About the last of July the young are in prime condition for the table and are much hunted.

Wild Turkey—*Meleagris gallopavo*.—Common; breeds.

Ruffed Grouse—*Bonasa umbellus*.—Found in considerable numbers in the northern mountains. Local name, "pheasant."

Virginia Quail—*Ortyx virginianus*.—Everywhere very abundant; breeds.

Killdeer—*Epiglotis reifertus*.—Common; breeds.

Spotted Sandpiper—*Tringoides macularia*.—Common along the banks of streams. Local name, "tip up."

Great Blue Heron—*Ardea herodias*.—This splendid species is very abundant, especially in the south; breeds in the cypress swamps of Montgomery county. Locally known as the "crane."

Little White Egret—*Garecta candidissima*.—Common in the south; not observed north of Birmingham. Associates with *F. carolinensis*.

Little Blue Heron—*Florida cervinus*.—Abundant north and south; breeds.

Green Heron—*Butorides circesiensis*.—Common; breeds.

Night Heron—*Nyctardus grisea*.—Common; breeds.

Bittern—*Botaurus minor*.—Not common. One specimen obtained in the south; breeds.

Mallard—*Anas boschas*.—Occasionally seen; abundant in winter.

Summer Duck—*Aix sponsa*.—Common; breeds in the swamps of Montgomery county.

Brown Pelican—*Pelecanus fuscus*.—Rather rare. A fine specimen was shot in the north by a gentleman of my acquaintance.

Least Tern—*Sterna superciliosa*.—Two specimens seen in Montgomery county, one of which I obtained and carefully

identified. It was a young male and had probably strayed up from the coast.

Pied-billed Grebe—*Podilymbus podiceps*.—Common; frequents the ponds throughout the State.

### OHIO GEOLOGICAL SURVEY.

**THE** fourth volume of the Ohio Geological Survey purports to be devoted to the Zoology and Botany of the State, but as a matter of fact includes only the Vertebrates. The report on the mammalia is by A. W. Brayton; that on the birds by Dr. J. M. Wheaton; the reptiles and amphibians are treated by Dr. W. H. Smith, and the fishes by Prof. Jordan. The report on the mammals contains nothing especially new. We are, it is true, occasionally surprised by a statement like the one on page 12: "It is scarcely likely that any [wild cats (*Lynx rufus*)] remain [in Ohio] to the present time;" but such errors are usually corrected further on in the report. The curious statement that the badger "is very abundant," presumably in Ohio, since the paragraph is not in quotation marks, is to be explained, perhaps, on the ground that the report is far largely a compilation from the works of previous writers, and contains little or nothing that cannot be found elsewhere.

The report on the birds is a much more satisfactory production. The introduction treats of the topography of the State and its climatic peculiarities, and touches also upon the laws of latitudinal variation, a subject which receives fuller attention further on (Appendix [E]); the nomenclature employed is that of Dr. Coues's "Key to North American Birds," only modified by more recent discoveries. The arrangement of the ordinal groups is also taken from the same work.

A description is given of each species of bird mentioned, its habitat, date of arrival and departure if a migrant, and very full notes on the habits of the species. These notes, too, are written in an extremely pleasant style, and are really delightful reading. It is impossible to allude to any considerable number of the points of interest which come up in the report. We may, however, notice that the skyhawk is given as breeding sparingly in the vicinity of Cincinnati. They are said to have been exterminated on Long Island in this State, but Mr. Edmund Orgill, of Brooklyn, believes that a few may still be found there. Dr. Wheaton notes nine specimens of *Dendroica ludoviciani* known up to date of writing, and Dr. E. C. Sterling informs us that up to the present year (1883) eleven specimens have come within his observation. The Carolina Wren is given as an occasional visitor, and the black vulture (*C. atratus*) has been taken. The extended account of the habits of *Ortyx virginianus* is extremely interesting. The ruff (*Phalaropus pinnatus*) has once been taken in Ohio. The white pelican (*P. trachyrhynchus*) occurs occasionally.

In his appendix to his report Dr. Wheaton gives a check list of Ohio birds, adopting the nomenclature of Ridgway's check list (Government Printing Office, 1881). This contains 292 species with four additional varieties and two introduced species, giving a total of 298 species and varieties; of these six are considered as accidental. This list gives also the dates of the arrivals of migrants, a very useful addition. There is also an excellent bibliography of Ohio ornithology, a paper on the Relation between Latitude and the Pattern of Coloration in Birds, and a Glossary of Technical Terms used in the report.

The list of reptiles and amphibians includes thirty-six species of the former and twenty-five of the latter. The introduction is interesting and the notes on the species full. Only three venomous reptiles, two rattlesnakes and the copperhead, are found within the State. There are three lizards and thirteen tortoises in the list. The following species are given as rare: *Phyllorhynchus melanoleucus*, *Urolophus collisator*, *O. dolabatus*, *Crotalus horridus*, *Crotalus scottii*, *Dipsosaurus dorsalis*, and *Lophocryptes*.

The report on the fishes by Prof. Jordan is, as might have been expected, in all respects admirable and needs no criticism or comment. One hundred and sixty-three species are enumerated, and of these forty are characteristic of the lake fauna, and sixty-seven of that of the Ohio, the remainder being common to both.

The report abounds in typographical errors, for which there is really no excuse, but very much of the material contained in it is extremely interesting.

**DUCK HAWK.**—This very beautiful hawk is rather a rare bird. Although it breeds on Talcott Mountain, Conn., and Mount Tom, Holyoke, and Toby, Mass., I have heard of but one pair breeding in any of the above places, except Mount Tom, and that very rarely. I have known it to be plenty fifteen years ago, but being robbed of their eggs, young, and shot, there are now but a few pairs in this section of New England. William Street, on Mount Tom, Mass., had one caged for two years, and, certainly, with his jet black eyes and winsome ways, he was one of the most interesting pets I ever saw. I have watched him for hours, and his every movement was graceful. I throw him a piece of meat and he would catch it before it could strike the bottom of the cage. Dr. S. G. Moses, of this city, kept three for quite a long time, but they made a feast of one of their number. The pair were presented to Prof. Spencer F. Baird, who prized them highly. These hawks do not build any nests, but lay their eggs on the bare rocks. And they are quite sure to lay their eggs in the places which are most difficult places for man to get at. Before the eggs were sought for, anybody could find their nest. They would fly to it, and keep up a screaming and you would see of sight. The young, when hatched, would make as much noise as a small drum corps. But since their eggs commanded \$4 to \$6 each, they have learned a few points. By visiting their breeding grounds you may see one hawk, but there is a scarcity of this particular species of hawk at once. When the young hatch now they are as still as a Quaker meeting when the spirit does not move. I have known thirty persons to visit Mount Tom in one day, and see this hawk's eggs. And they got a good view of the beautiful Connecticut Valley for their interest in natural history.

—FLICK FLICK (Hartford, Conn., May 15, 1883).

**A FAWN AT LARGE.**—In the Central Park there is a fawn which the keepers are unable to capture, and which wanders freely about the park, keeping up a screaming and you would see a flock of peafowl and guinea hens, roaming during the day with them about the Park, and at night sleeping under the tree in which they roost. When the fowls are fed he picks up some of the kernels of corn which are thrown to them. He is very tame and will take food from the hands of visitors, but is very suspicious of the keepers or the workmen who have several times tried to catch him in order to return him to the deer paddock.

## DUCK BOAT.

No. 1. DECK PLAN. Scale of Feet.

No. 2. Section Through Middle Line. Scale of Feet.

No. 3. Midship Section. Scale of Feet.

## A DUCK BOAT.

Editor Forest and Stream:

Enclosed please find three plans of a ducking boat that I have been building. She shoots but little above the water, draws but little, and so can be used in shoal water, can easily be transferred into a capital blind by using a little grass, weed, or brush on the deck. She is not easily turned over, and a person can shoot from any position in her, which he cannot do in a canoe. I know this from experience, as I have spent many a day in one both here and in Louisiana.

In the first place, to get frames or ribs I lay out on the floor a cross section both ways of the boat, full size; lay off the ribs or frames a foot apart the whole length, and taking the measure of each one on the horizontal plan gives you the length, and in the perpendicular section the breadth. Then on the ends leave the width of the sides, which in my boat is only 13½ in. Then take a strip of thin stuff, and from a dot that you make for the width on each side of the center spring the strip to the width of sides at each end, top and bottom, and you have the curves for the ribs. Saw out the center as far as the cockpit comes, and you have the forms. Stay them to the floor, and put on the bottom first.

Material for frames and ribs ¾ in. oak, also for the sides, which, as I said before, are only 13½ in. wide. Screw the sides to the ribs, stem and sternpost with ¾ in. No. 6 wire brass screws. It is now ready for the bottom. Use 3-16 in. oak stripped to 6 in. in width, and where each joint comes use a batten 3-16 by 1½ in., clenched through about 1½ in. apart with brass escutcheon pins, driving them through on the face of a hammer or piece of iron.

Use plenty of white lead on the battens and on the edge of the sides. I fasten the covering to the ribs and sides with ¾ in. No. 1 wire screws and escutcheon pins.

For floor to the cockpit I use ¾ in. pine, and the washboards to cockpit ¾ in. black walnut worked up and down and screwed to a strip let into the top of the frames, and at the bottom by strips put between the ribs. The midship section (No. 3) shows it in detail.

Amount of material: about 100 ft. of 3-16 in. oak, 20 ft. of ¾ in. oak, enough ¾ in. oak for stem, sternpost and keel, 20 ft. of ¾ in. pine for floor, and enough material for the washboards, which can be black walnut, pine, oak or whatever a person chooses, 1½ gross of ¾ in. No. 6 wire brass screws, 3 gross of ¾ in. No. 1 wire brass screws, and 800 of stout brass escutcheon pins ¾ in. long. This is all that is required but paint.

I shall rig my boat to sail, using two legs of mutton tails, sharpie rig, and also to row. The oarlocks will want to be placed on the outside and raised up high enough to clear the washboards, which can be done by a block or an iron, the boat being so wide it can be used with quite a long oar, and by a good oarsman it can be sent along very fast.

I have not weighed my boat yet, but think she will weigh about 40 to 50 lbs. She could be built of cedar to weigh much less, but I wanted mine strong, so I could cart her to the different lakes over the rough roads of this country, and so used oak.

P. T. H. S. P.

Since writing you I have used my duck boat. She works to a charm. With a few weeds on her deck she is a complete blind. I use the same oarlocks that are fitted to my canoe. The boat draws very little over 3 in. of water. I can change from rowing to the paddle in less than a minute.

P. T. H. S. P.

WOODCHUCKS IN TREES.—Portland, Me., May 19.—While reading "W. H. R.'s" account of a "Fox in a Tree," in the FOREST AND STREAM, I was reminded of a circumstance that occurred a few years ago while following a brook through a piece of woods in search of trout. I heard a "scratching" sound near by, and upon looking in the direction from whence it came, saw some kind of an animal ascending a small-sized tree that stood on the side of quite a steep hill, only a few rods from where I stood. Going quickly to the tree I discovered a woodchuck perched upon

We had very fair luck, for in less than twenty minutes old Trueboy and Rattler were giving tongue. Trueboy would tackle nothing less than a deer, and foxes might cross his path a dozen times when he was after deer without danger of pursuit.

Kilbourn and his companions could now hear the music and were on the alert. In ten minutes more we heard bang! bang! bang! in quick succession. Making sure that our friends had had at least some sort of success, we pressed on, only stopping a moment to breathe, and bang! bang! once more. Heigh! but we are making it interesting for them, sure enough.

My companion sits down on a log. I follow, when my eye is caught by the vision of as noble a pair of antlers as ever graced a stag's head. Great Scott! my gun; where is it? Curse the fates! it's ten feet distant! The case is hopeless, but I seize it and fire; too late! That confounded stag has, for all I know to the contrary, been standing off among those bushes gazing upon me for a full minute; perhaps longer.

We press on, cursing our ill-luck. Kilbourn and the "Doc" are known to be dead shots, and surely after all that banging and blazing must have hit something. We found, upon joining them, that they had stationed themselves where the runway crossed a beaver meadow. Kilbourn had fired somewhat high, owing to the stag having stumbled as it passed him. The Doctor, however, finished the job by sending his ounce of lead through the heart. Old Doc caught him at the moment he cleared a very large fallen tree, just in front of which—perhaps ten or twelve feet—was a log somewhat raised off the ground. Both head and antlers went clear under that log.

The rest of our party had had bad luck, two of them having seen a fine large doe, but before they could get within range they lost her, owing to the proximity of some lads who were squirrel shooting, and who blazed away at anything and everything.

After doing justice to a plentiful supply of sandwiches, and drinking success to FOREST AND STREAM in its noble fight for efficient game protection laws, and death to professional poachers and pot-hunters, we returned to Owen Sound.

A word about "the Sound," as we call it. Deer and bears are plentiful within a radius of ten miles; hares and partridge, duck and quail within five miles; speckled trout, salmon trout, pike and doré at our very doors. We will welcome and assist any brother hunters or anglers who may visit us, but only under the condition that they come among us as true sportsmen—i. e., men who will, under all circumstances, give the game a chance for their lives. W. W.

OWEN SOUND, Canada.

## HUNTING RIFLE SIGHTS.

Editor Forest and Stream:

As you have seen fit to publish my opinions on the rifle, I do not think it out of place to add thereto, as a kind of *addendum*, some thoughts about the proper sights for the hunting rifle. In the first place, I do not think that the best rifle for wing-shooting or shooting at game in motion, needs any sights at all. In fact, I believe they are better without any. This may, and I know does, sound to a great many as preposterous; but I can assure all such (and I think I will not have much trouble in proving the assertion) that there are a great many theories accepted as facts that have no scientific value whatever. If we have no eyes, we certainly have no need of gun sights, and if we produce an aberration of vision that interferes with the organic function of the eye, by peeping and squinting, we virtually have no eyes to see straight. I shall not attempt a discussion of this subject at present, but

will simply say that I have made, at a hundred yards, as good a target, with a shotgun, shooting as solid ball gun, as I did with rifle, and I understand that a great many, if not nearly all, of the best guides of Newfoundland use smooth bores, and I have very positive evidence that the Indians of our own mountains and plains use double or single-barrel shotguns with solid ball for buffalo and deer hunting, and will hit and kill about as many as the finest rifles in the field. This, of course, at short range. I make this assertion, then, that for wing-shooting or for shooting at game in rapid motion, the best hunting rifle does not need any sights at all.

But, as no one would have a rifle without sights on it, I will advise, by all means, to select the sight that will come as near as possible to giving you the use of both eyes. The open clover leaf with brass head, will meet the indication probably as well or better than anything else in use. Our forefathers used a small bead of silver set into the gun barrel near the muzzle, in many instances not to exceed the sixteenth of an inch in height, and never more than an eighth, while for a rear sight a small piece of steel was dovetailed into the barrel about ten inches from the breech, and filed down square to about an eighth of an inch, in the center of which a small notch was made. This brought the eyes on line with the gun barrel, and enabled you to see your gun as well as your game. And I tell you, Mr. Editor, these guns did kill, and kill at long-range distances, too. I put one of these old sighted rifles to my face, yesterday, and I find that the eyes strike the line of sight easily and naturally. You don't have to hunt around for your front sight, then find the notch in the hind sight, and then, probably, take your eye off the gun before you see the game; but everything necessary to good, quick shooting is naturally presented, and the eye at once takes in the whole field. OCCIDENT.

SEBASTIA, MO.

A MAINE SHOOTING COUNTRY.—Smyrna, Aroostook County, Maine, May 16, 1888.—Ruffed grouse wintered finely. Have never found them more plentiful at this time of year, and the season thus far has been extremely favorable for rearing young broods. In view of the mooted question of red squirrels destroying the eggs and young birds, it is worthy of note that I have met with but few of that species hereabouts this spring during extended tramps. This section has never been worked by outside sportsmen, and offers great inducements, especially for grouse shooting. Most of the region for many miles is traversed by logging roads where in the fall the birds are mostly found, thus making it easy for shooting. Later in the season deer and caribou will afford good sport, as they are fairly plenty in a range of from five to ten miles of this settlement, with some moose at the latter distance. There are no regular guides or hunting camps, so this is no place for "tenderfeet." In this settlement there are six families, some of whom have staid lads who know the country, and whose services could be obtained at a nominal cost, and at one or more of the farmhouses a fairly good home could be found. It is no place here for the market hunters, being too far and difficult for shipping, and besides, the community would not tolerate them.—WARFIELD.

SUNBURN.—Answer your correspondent, "Kew," that "I. Trask's Magnetic Ointment" is a wonderful remedy for sunburn, insect bites, bruises, and all sorts of inflammatory wounds. I have carried it for ten years and it never failed.—PISCO.

VNIGHTSVILLE, Pa., May 14.—Farmers in this vicinity find rabbits more numerous this spring than what they have for a number of years.—RAZOR.

a limb some fifteen feet from the ground. I tried to dislodge him by jarring the tree, but it was too large for me to effect anything in that way, so I picked up a club to throw at him, when I was surprised to see him spring out from his resting place and land some thirty or forty feet down the side of the hill among the leaves and rocks that were thickly scattered over the ground. That he was not dashed in pieces against some one of these was a great wonder; but after rolling over a few times, he regained his feet and scampered away to his hole, which, being too tired to give chase, I left him free to do.—G. L. B. [It is very common for woodchucks to climb trees.]

**AUSTRALIAN GOOSE SHOOTING.**—Adelaide, South Australia.—*Editor Forest and Stream:* In Spencer's Gulf and about 190 miles from Adelaide there are one or two groups of small islands, which are the southern extension of the "cecropian geese," commonly called "Cape Barren geese," from the fact of their being first found at that place, congregate to breed. This breed is somewhat smaller than the common goose, and is of a bluish-slate or gray plumage, with black bars on the wings. The legs are strong, dark in color and tinged with red, the feet are webbed, neck slender, bill green with black tip. It is easily domesticated, and proves a decided acquisition to the poultry yard. The flesh is of a dark color and very delicate. Its food principally consists of young grass. The old birds come to the island about the month of June to lay their eggs. When the young are about half grown they can easily be caught, and the old birds at that time afford good sport for the gun. When the young birds are full grown and able to fly sufficiently well, they all leave the island and find their way to the inland streams of the mainland, and do not appear on the islands again until the following season.—F. V. S.

## Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

**ANGLING RESORTS.**—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

A fine speckled trout that long safely had lain  
In the crefts of the rock, out of reach of the seine,  
Being hungry, looked up, and was pleased to spy,  
Floating over the water, a green bottle-ly.  
"Just my luck," said the trout, "I shall soon be the winner  
Of fat, juicy fry for the left of my dinner."  
With a wink, and a nod, and a tremendous bound,  
He sprang for the fly but he lit on the ground.  
Just then a man looking for something to eat  
Put that same speckled trout in his basket for meat.

## AN EVENING'S REFLECTIONS.

THE springing grass, and the bursting buds, and the chirp of the robin speak to the heart of the sportsman, telling him the season has come in which to overhaul his fishing gear and see if he is ready for his annual sport, and, what is generally more doubtful, whether he is going to find time to take an outing before long.

I have just laid down a volume of sketches which many of your readers have read (and those who have not have missed a real pleasure), which at the same time pleased and saddened me. It is "Pleasures of Angling," by that veteran sportsman and your late correspondent, George Dawson, who has so lately gone over the river with the great "majority," and will no more delight us with the productions of his facile and graceful pen, nor ever again by wooden lake or streamlet engage in the sport which was so dear to him, and which he so thoughtfully and in such a true spirit of a sportsman interpreted.

While I never had the pleasure of meeting him in the flesh, yet I breathed through all his writings such a gentle spirit—so like that of dear old Isaac himself—that I think every true lover of the craft could but hail him as a brother and feel almost a sense of bereavement at his death.

Now, when Nature with her kindly hand is mantling with the verdure of spring, his newly-made grave, with what pathos do these words of his come back to us:

"I sometimes wonder whether, on some pleasant day in May, not long hence, I shall stand on this sunny spot where I have stood during some portion of every season these twenty years, and find in attempting to make my usual cast, that my right hand has forgot its cunning. As old age cools the blood and dims the vision, and checks the elasticity of brain and limb, such thoughts sometimes come to the most buoyant and often cast a shadow across the sunniest landscape. But it is only a shadow. With the thought comes up the vision of another river, brighter, and clearer, and purer than that which flows with such gentle gratefulness at my feet—a pure river of water of life, clear as crystal, proceeding out of the throne of God and of the Lamb." It is a vision which reconciles all thoughtful anglers to the quick-coming and quick-passing of these pleasant years, which now know them no more forever.—[Pleasures of Angling, p. 231.]

Surely here is the very spirit of a gentle sportsman; one who did not think that to catch fish was all for which a sportsman sought the forest streams.

He sought and found what so many of us have found there, an inspiration from Nature's pleasures, the pathless woods—a something which will remain with us when age creeps over us with his plying touch, golden memories, untainted with any of the alloy which mingles with so many of the pleasures which are found elsewhere.

I am familiar with many of the places of which he so graphically writes, and after many years' experience with rod and reel, hope for many more, but the falling by the way of one after another of the old school is a frequent reminder to us all.

With perceptibly failing eyesight, and a touch of rheumatism, I was the other day looking ruefully at my gun and rods, and remarked to Mrs. Bamboo that it was pretty hard to get so blind that I could not see to shoot, and so rheumatic that I could not cast a fly.

That excellent woman murmured something about a lame knee not preventing a man from fishing, and in sooth, I think myself that I could, without my eye-glasses, see a ruffed grouse fifty yards away, distinctly, and that is about

as far as anybody has a chance to see one, generally before he lives over and behind a tree—whether as one of your correspondents says ("Mark West") you follow him with your second barrel and he falls dead in the next county! But lest I might seem to be dipping into that "ruffed grouse" discussion, which so warmed up your pages last fall, I hasten to drop the subject.

With the above "Piscene's" views upon the subject of guides as given in his late letter, and to extend my regrets that the "exigencies of the service" will prevent his making his anticipated trip to the woods, as your readers may possibly thereby lose a good letter from him with an account of his experience there.

Speaking of Adirondack guides, I wonder if Jack Sheppard has yet found the key to the camp, of which he had charge in June, 1879, and which, as Jim Higbee (model guide) was pulling Mrs. Bamboo and myself up through Third Lake, he, meeting us on his way down, tossed to us, at the same time offering us the hospitality of his camp. The key fell about two inches short of Higbee's outstretched palm and disappeared in the placid waters of the lake. We did not stop to look for it just then, but we got into the camp through a thanks to an unfastened window, and by the same token, James soon had us a delicious dinner, composed of venison steaks and a three pound and a half trout which Mrs. B. had caught, and milk and other things from our basket, the memory of which meal, and the voracious appetites with which we devoured it, and the enjoyment with which we subsequently watched Master Bamboo, aged four years, catch his first trout, and prove himself thereby a chip of the old Adirondack. All these are part of the memories of other days.

As is also the trout which I struck in Panther Lake, weighing less than a pound, which towed our boat a hundred yards before I killed him, and which the guide was sure was a three-pounder. And in the afternoon I took from one spot, without moving twenty feet, fifty-three trout, and stopped then only because I had enough. And floating down the Moose River, in company with a gentleman now well known as a trout breeder and an officer of your State association, what royal sport we had that afternoon! These are now only memories of the past, but

"Let Fate do her worst—there are moments of joy—  
Bright dreams of the past which she cannot destroy.  
Which come in the night time of sorrow and care,  
And bring back the features which joy used to wear."

BOSTON, May 13, 1888.

SPLIT BAMBOO.

## THREE GREENHORNS.

"HAVE you got a pack of cards, O'Neil?"  
"No."

"Oh! hang it! let's go back and get them."  
"Not much. I wouldn't go back for a dozen packs."

Thus the twain wrangled, while the third of the party placidly listened to the dispute as he urged the horse onward with emphasis.

We were bound for Success Meadows. Owing to business affairs we were unable to start before 5 P. M., on a warm July day, and the long night drive of twenty miles from Betts to Grafton Notch, was one of the most pleasant that ever fell to the lot of mortal man. It is a glorious place, the Bear River Valley. On either side, the meadows sloping up to the base of long, undulating hills and mountains, were dotted with hay-cocks, covered with snowy caps, while the road wound in and out among them, and twisted around the base of Mount Saddleback like the track of a weaver's shuttle; and at times we could hear the low rumbling mutter of the restless stream, echoing down the impassable gorges of the hills. We had none of us had much experience in roughing it, but we knew enough to travel as light as possible, and had made up our packs before the start.

It was full 9 P. M. ere we reached Grafton. O'Neil was acquainted there, and rousing up a farmer, put up the horse in an empty stall, while the two others proposed to try the hayrack and secure rest to the lot of mortal man. It is a glorious place, the Bear River Valley. On either side, the meadows sloping up to the base of long, undulating hills and mountains, were dotted with hay-cocks, covered with snowy caps, while the road wound in and out among them, and twisted around the base of Mount Saddleback like the track of a weaver's shuttle; and at times we could hear the low rumbling mutter of the restless stream, echoing down the impassable gorges of the hills. We had none of us had much experience in roughing it, but we knew enough to travel as light as possible, and had made up our packs before the start.

The whole night was one continual squirm. Toward morning, however, I dropped off into a nap, the last sound that met me being the words of the farmer, "You're a good one on an old wheelbarrow that we had turned into a crib, and for which he had developed a decided taste, and the uneasy wriggle of Harry as he scratched a "hopper down his back and kicked frantically in the hay.

The morning dawned cold and rainy. With frowzy heads we crawled out from our too attentive hosts, and with a hurried breakfast shouldered our packs and started for a five-mile tramp under a blazed path through the woods. Well, it wasn't pleasant, and the general vagueness of our directions did not add to its enjoyment, either. But all things must have an end, and about noon, after twice losing the path, we suddenly emerged on the bank of Silver Stream, and then—

We forgot our weariness. Never till then had such a beauty of a stream been darkened by the shadow of our rods. Thenceforward, from its home in the mountains, it leaped straightaway down through a long ravine, with pool after pool of calm, foam-decked water fairly alive with trout.

Every fall seven or eight lying there awaiting their chances, and so clear was the water that their magnificent size be distinctly seen, and we could almost count the pink spots upon their sides.

They were not at all shy, either. We counted seven great fellows before we had a single huge fallen tree, and of these Harry and I secured six within ten minutes, the two largest weighing a pound and three-quarters each. Pretty good, that, for brook trout in Oxford county, though the time was—not in my time—when every stream here teemed with just such fellows.

At last we stopped. Our creels were heavy. Our arms ached, our legs were stiff and sore, and it was raining. Putting down our rods, we started for the meadows, which we had been assured were but a little way on.

Like the Dutch Governor's foot, that "little way" meant a good deal, but the prospect of having a good barn to sleep in, and the general dampness of things, urged us on to a final effort. Just at dark our efforts were rewarded, and leaving the stream we came out into a broad, arched plain among the hills, where was the barn? Chances were, it was stuck on another.

"Say, Harry, don't you want a pack of cards?" That was

the only remark offered by the candidates for a modern Babes in the Wood.

We got a fire somehow and extemporized a shelter by its light, and after we had secured a scanty protection from the rain we felt better. Not much, though. Erie's thoughts are apt to arise; and who has ever forgotten his first night in the woods? Add to this that our only arms was an axe, and that wild cats, and even panthers, had been seen in that region. It can be imagined how our thoughts would turn as we sometimes gazed at our slender stock of fuel. It was a real test of courage for us to go to the stream for water, twenty rods away, and although I did it twice, and was much looked up to for my daring, yet I must confess that it was in fear and trembling. Once during the night we had a terrible fright. "Then shook the earth with the sound of a great rumbling," and it wasn't a light one either. I jumped for the axe. Harry held on to one of my boots, and O'Neil stood frantically brandishing the coffee-pot in one hand and a middle-sized jack-knife in the other. The alarming sounds died away in the distance, but they took all desire for sleep away with them. Bitter were the curses heaped upon ourselves, mentally, as we squatted around our sputtering fire, and vowed audibly we "wouldn't go there again." If the fish that we had killed had any ghosts wandering in that rain they must have been delighted at our misery.

Well, drabbed, rheumatic, we hailed the early light with heartfelt thanks.

Making a small pyramid of our extra "grub" at the foot of a tree, we headed for home with all possible dispatch. We stopped not for fishing. We had all we could carry already, and with a eleven-mile tramp up the bed of the stream and through the dripping woods before us. We turned.

We followed a well-marked path down the meadow, and as it grew brighter were startled by several large animals rushing out from behind an alder clump, and coming toward us at a tremendous rate, looming up in the thick mist to antediluvian proportions. They turned out to be a dozen or so horses, who welcomed us as the first human beings they had seen for years.

This explained our midnight fright, and with a hearty laugh we felt cheered already, and were ready to make fun of every mishap. Once I heard a splash, and turning saw the dinner-pail calmly floating down the rapids, and as I looked O'Neil deliberately wheeled around and softly sat down in the white water of a fall, and it was only his quick look and involuntary grimace which I saw he was caught, that proved that he had not meant it. Of course we roared till we nearly dropped as he rose like a spirit of the waters, in solemn and dripping majesty, and stalked shoreward for a private wring.

Again I saw Harry totter and fall with a loud spunk on a stone. There was a sharp crack. For a moment my heart stood still, but it was only the lancewood hull of his rod split from heel to ferrule. I was not hurt, and the squabbling should have come next, but before it came we had left the stream, and the rest of the way seemed wonderfully short.

A cup of hot tea at a farmhouse and a warm fire, and we were soon rolling homeward, explaining mutually that there must always be a first time, and vowing that the very next season we would try it again. The last words that I heard before falling asleep in the straw on the bottom of the squabbling bed, "Say, O'Neil, are you fed yet?" To which he sagely responded, "Harry, my boy, don't you want a pack of cards?"

And, verily, "it is something pleasant to remember hereafter."

VERUS.

## ANGLERS' ASSOCIATION OF EASTERN PENNSYLVANIA.

*Editor Forest and Stream:*

As your paper has manifested a kindly interest in the welfare and prosperity of our anglers' association, a word or two in regard to its present status may probably prove acceptable to some of your readers.

Although comparatively in its infancy, the Anglers' Association of Eastern Pennsylvania has already had the benefit of vigorous vitality which promise to result in an organization that will prove both permanent and beneficial. The new headquarters at No. 1,020 Arch street, although not palatial, are snug and comfortable, the only fault to be found with them being their inadequacy for the accommodation of the members who sometimes are in attendance. At each meeting this becomes more apparent, for the space which is rapidly enlarging, and consequently more spacious quarters are demanded. That these will be secured there can no longer be a doubt entertained, and I look hopefully forward to the time when we shall have a building all to ourselves, with library, museum, reading and smoking rooms, etc.

It is a noteworthy fact that our membership is composed of real good material, so that whatever has been or is likely to be attempted, will be carried to satisfactory conclusions. Among the measures already adopted has been the publication in placard form of extracts from the fishery laws of the State, which relate to illegal fishing—or the killing of fish, rather—by any other than the legitimately prescribed methods. These placards have been framed, and by permission of the railroad companies, have already been placed at all principal stations along our principal rivers, as well as at other points where fish abound and where the laws are disregarded.

We have stringent fishing statutes, but the lack of enforcement renders them practical nullities. They are not of the slightest avail, and hence might as well never be enacted. It is hardly necessary to state that under such circumstances illegal fishing in all its forms is largely practiced, and whatever has been done in this way of re-stocking streams, has amounted to little or nothing. With the hope of remedying this to some extent, the placards referred to have been printed and will be widely distributed.

The State has spent some money which, however conscientiously disbursed by the commissioners, has thus far been unproductive of the desired results. The money has been expended in hatching establishments had been applied to the payment of fish wardens, whose duty it should be to guard the restocked streams, the people would by this time be enjoying something in the shape of a return for their outlays.

Our association has adopted a plan for gaining information in regard to sporting matters which promises to work well. A reliable correspondent is secured in every principal fishing point, who during season sends us weekly reports of the condition of the fishing, what kind of fish are biting, whether they are plentiful or scarce, whether large or small catches are made, etc. These correspondents

are furnished with postal cards with printed questions as above, the answers to which they write out. These cards are placed in a box provided for the purpose, so that members can, at a glance, gain authentic information in regard to any waters they may contemplate visiting.

It is also proposed to establish a museum—literary and general reading room in connection with the association—all of which will be kept open for members' use day and evening. As this will require more money than we have at present command, a vigorous and what promises to be a very successful campaign is being made to increase the membership, which now numbers 150, to at least four times that number.

Arrangements have also been made for monthly lectures or addresses on subjects relevant to the object of the organization. The first was delivered by our president on Saturday evening last, who took advantage of the occasion to defend the angling fraternity generally against the frequent imputations cast upon their veracity when narrating fish stories, and also to impress upon the members the importance of increased efforts in behalf of fish propagation and protection; the prosecution of offenders against the fishing laws, and the formation of a white and black list of boatmen and landlors, the first to contain the names of those landlors who set good tables, provide good beds, and are moderate in their charges, and of boatmen who are competent and obliging; the second to contain the names of landlors and boatmen of opposite characteristics. The speech also took strong ground against the too prevalent practice of anglers, as well as commercial fishermen, of failing to return to the water when alive, fish too small for sale. The next address will be delivered by Rev. W. Mayland Hoyt, D.D., a thorough and very enthusiastic fisherman, who proposes treating us on that occasion to an account of his visit to Yellowstone Park, and the kind of sport he found there. From that you will perceive that we are doing where we can for legitimate angling, as well as for the promotion of fish culture.

W. L. R.

PHILADELPHIA, May 11, 1883.

## MILTON THREE PONDS.

FOR the first time, in your issue of May 3, under heading of "Black Bass in New Hampshire," I see mention made of Milton Three Ponds. It is five years ago last September that I got the hint of good black bass fishing to be had at Milton, I then lived at Dover, N. H., and at the invitation of a friend who lived at Milton, and who knew the spots in the ponds where the bass were likely to congregate, I accepted. On the cars going there I had the pleasure of becoming acquainted with Fish Commissioner Luther Hayes, who gave me some valuable hints on bass and bass fishing. I stayed four days, and had a never-to-be-forgotten time, catching from ten to twenty-two bass each day, besides many pickerel as well as some large yellow perch, and quite often a horn or bullpout, and large chubs, and never getting time to weary for the want of a bite.

The largest bass I ever got there was 4½ pounds, average weight about 14 pounds, and as game as bulldogs. It seemed uncertain at times whether it was a bird or a fish that had been hooked, as they fly in the air so often, and with a light rod you get all the fun you want. Regarding the best bait for bass I am uncertain, as they are the most changeable, for after two or three are taken they seem to find out the deception.

My experience runs thus: I will have good luck with the live minnow, sunk deeply; then, all at once, they stop, as they said, "Enough of minnows, bring along the next change," and, putting on a small frog, either striped or green, catch two or three more. Then they stop, and then they stop short again, when I throw a large grasshopper or locust; another rush, and, when all the more fancy baits would fail to lure, I have put on the primitive and most despised, yet most deadly of all baits, the worm, and thus got a new lease of bass fishing.

In rowing from one pond to another, I have had good luck with the pupa and the caddisfly; and when a ripple is on the water they can be taken readily with the fly.

Good boats can be hired at the railroad station for fifty cents per day, and good board at the Phoenix Hotel, kept by Horatio G. Wentworth, at one dollar per day. I would recommend parties going there to take frogs with them, as in all of my five annual visits there I found frog bait scarce. Minnows are plenty in the ponds, and a small seine will get them in half an hour. People say at Milton that land-locked salmon have been put into the ponds, but I never heard of any being caught. About October is the best time to go for a general good time, if you are fond of a shot, as there are many ducks, and many shooters come along about then. There are shore birds called snipe at Milton, but they are, as I think, sandpipers or sandpeeps. Gray squirrels are plenty in the immediate vicinity of the ponds, and rabbits are quite plenty later in the season. Take it all in all, it is a good general place, easy to get to, with cheap boats and board. You can hire a man to row for one dollar and a half per day, and ice and boxes to send your fish away to your friends. Ice costs nothing, boxes can be bought at the grocery store. Any one who cannot have a good time at Milton Three Ponds will be hard to please.

RIVER POINT, N. H., May 14.

## MUSKOKA LAKES.

I N reply to inquiries by "J. D.," New York, and others, and, as Mr. E. S. Kingsley said, "to add to the general stock" of knowledge on the subject of sport, I would mention the Muskoka Lakes as the acknowledged best place in Canada.

The earliest fishing is to be had through the ice in March and April. Barre on Lake Simcoe, is the most convenient place. Here lake herrings are caught in great quantities, with the minnow as bait, and here, too, the question as to the great whitefish of the lakes taking the bait was settled. Those caught in Barre Bay average about three pounds, but the herrings are full-sized. They run together and are fished for through the ice in from eight to twelve feet of water. The line is usually held in the hand, the rod, for obvious reasons, being in the way. So soon as the ice goes, which is usually about the seventh of May, begins trolling for bass, pickerel and muskies. The rod-fishing (it may use the term) for bass is simply magnificent in all parts of lakes Muskoka, Rosseau or Joseph, and in the smaller adjacent lakes. The bass fishing in the rapids of the Seneca River and at Sparrow Lake is excellent, the more so because they are at a sparrow with hackle can be used. Here I tipped the beam at five pounds and a quarter. It was

twenty and a quarter inches long and seven inches wide. Maskinonge are caught weighing from three to forty pounds. Trolling for salmon-trout begins in the end of May and lasts about three weeks. The Indians begin when the blossom comes on the plum tree. There is late in the fall another interval of three weeks when they will take the spoon. The Indians use for bass, pickerel or maskinonge a spoon red inside and bright brass or silver outside, bare hook sometimes, and at other times a hackle of red worsted. For salmon-trout they choose a spoon silver inside and dull copper outside, and for huckle use the white hair from the end of a deer's tail. They always fly a good quarter of an inch from each side of the common spoon-shaped "spoon" to give the swiftly-moving fish a chance of catching the hook. It is strange that in lakes Muskoka and Joseph the lake trout lie in deep water close to the bottom. They must therefore be trolled for with a line of over two hundred feet with about two pounds of sinker; but your eight to fifteen pound salmon-trout is a royal and worth all the trouble. Keep your gaff sharp, and don't swim near the boat.

Splendid brook-trout fishing is to be had on the Maguete-wan and Muskoka rivers.

The lakes are reached from Toronto or Hamilton by the Northern & Northwestern Railway, of which Mr. Robert Keer is the general passenger agent. Muskoka Wharf is about one hundred and fifteen miles north of Toronto, and is the point at which the steamers are taken for the various fishing points on the lakes. The return ticket from Toronto to any point on the lakes is only six dollars. Hotel accommodation is to be had at all landings and towns, and costs from one dollar to one dollar fifty per day.

I am sure there is no better place for sport, and no one will be disappointed. I will gladly give any information in my power.

M. MACLEOD.

BROCKTON, Ont.

## PICKEREL IN NEW BRUNSWICK.

I HAVE been much interested in the pickerel discussion that has been lately going on in your paper. I do not remember when or where I first beheld the lipper-like lines of this fish, but my memory recalls distinctly the first time I ever heard of it. When a boy, I made the acquaintance of a young Southerner who was traveling with a variety troupe. He, finding me very willing to listen to hunting or fishing yarns, delighted me with accounts of pickerel fishing and told me how he had often shot them with a rifle when they were scarce. He said the six-dollar hotel accommodation is to be had at all landings and towns, and costs from one dollar to one dollar fifty per day.

Since then some enterprising person has stocked a tributary of the Upper St. John with them (on the Maine side), and now we have pickerel and pickerel. In 1876 a few were caught at Eel River, a hundred miles from here, and in 1878 they arrived in our waters in numbers, taking the fishermen by surprise. Tons of them are exported annually. Winter does not interrupt the fishing, which is done with nets exclusively. A series of holes, ten feet apart, are cut in the ice, and the net is anchored at one end, and then pulled along beneath the ice by means of a hook till extended its full length.

When the net is overhauled, a long cord is attached to one end, the fastening is slipped, and the net taken out on the ice. By the aid of this, the net is reset with only two holes in the ice. Last winter three tons were caught in this way in Foshy's Lake, a body of water about twenty acres in extent. The "pickerel holes" have become such a nuisance that the Government has enacted a law against leaving them unmarked.

No doubt, the person who planted pickerel in the Aroostook (I think it was) did a good turn for those who make a livelihood by catching them, but the Government fishermen and trout anglers must against him "curses not loud but deep." The sharp-nosed brutes make havoc among the nets of the former, easily cutting through the slender twine, and the latter say that they have invaded the spawning grounds of the trout, devouring the spawn and small fry. I bear no malice against their disseminator, for I believe I know of plenty of good trout waters that they will never reach; but should this be the case, I will guarantee to furnish him free of charge the addresses of the anglers who would not like to see him. After he made their acquaintance, I don't believe he would feel like experimenting any more at Ly-sander Hall. "The evil which men do lives after them; the good is oft interred with their bones." The work of this person, whether good or evil, will "endure forever." As to the value of pickerel as a food fish, there appears to be great diversity of opinion. I take lake stock in a fish diet, but as a panish I consider it a success—anything else would be like to see him. Many people in this section will not eat them at all. One thing is certain—when tons are exported at five cents a pound, someone must eat them, and by this fact I consider its value clearly established. I know but little of its game qualities, but think it would be a great improvement on the eel, catfish and chub—the fishes to which I was often compelled to flee for amusement when a boy. I feel that the small boy of to-day, with piscatorial inclinations, would find great advantage over his predecessor of fifteen years ago.

No person likes to fish any better than I, and few have less chance to indulge their tastes for this pastime. But I read in FOREST AND STREAM what others are doing, and am content. My entire experience in fly-fishing is covered by a few days on Pallet River—just enough to make me wish for more. My casts would hardly have taken a prize for accuracy, distance, or delicacy, yet I managed, in some way, to land five half-pounders, and a few more about half as large. With an angle-worm I am "no slouch," though I have seen people who could beat me even there. I have received an invitation to be one of a party of four which will spend a month on Green River lakes, in Quebec, commencing about the last week in August.

If the multifarious duties of this life, that so encompass me round about my neck grip for that length of time, I will go. Under the tuition of a professional angler and a quondam Rocky Mountain fur trader, I have no doubt that I would acquire some knowledge of the "gentle art." One of your correspondents advises bachelors who contemplate a visit to the woods, to get a wife and take her along to cook the fish. He also prescribes a courting ritual, unsurpassed for beauty, but which I fear would not always give satisfaction. For the author might find that "you get," as well as "you bet," will be "with my pen."

I advise the boys, should they follow the advice, to be very careful in the matter of selection. I have often known "the bonds of matchlock" to end a young man's career as a sportsman, and frequently when another victim migrated from our thinned ranks, have been led to exclaim with the poet, "And now farewell, 'tis hard to give thee up," etc.

Once or twice I have attempted to decoy my friends away on an excursion after "changing their condition." Perhaps I made a grievous mistake in not including the lady in the invitation; but when I saw the fairest of forewoods take upon itself the appearance of the map of a track yard at a shunting station, I felt little like repeating the experiment. "And the mother-in-law, what does she say?" "She-h, don't mention it; many of you have been there yourselves, and know all about it."

L. I. FLOWER.

## THE FISHERIES EXHIBITION.

BEFORE leaving New York "Uncle Reub" was properly labeled and consigned to friends in London. Among other credentials he bore the following to the general editor of the *Fishing Gazette*:

"OFFICE FOREST AND STREAM,  
"NEW YORK, April 4, 1883."

"R. B. Marston, Esq.,"

"Dear Sir—Permit me to introduce to you Mr. Reuben Wood, who goes to England in charge of the light fishing tackle of America. Mr. Wood is an accomplished fly-caster and has carried off many prizes. He wants to try the trout, and perhaps the salmon, of England and Scotland, and any favors you may show him will be duly appreciated by both himself and Yours very truly,

"FRED MATHER."

The editor of the *Fishing Gazette* publishes the above letter, and says: "We have had a long, pleasant meeting chat with Mr. Wood, and hope before long to pilot him to one of our best trout streams." He has kindly promised to be present at the Third *Fishing Gazette* Tournament and show the American split-cane rod as used by American anglers."

The tournament will be held at Mr. Warner's Welsh Harp, Herndon, on the Midland Railway, June 11.

Regulations.—N. B.—Competitors can use their own rods, reels and lines, but will have to use flies, weights, etc., provided by the management, in order that all may use a similar weight. Limit in length for salmon rods, 20 feet; limit in length for double-handed trout rods, 14 feet 6 inches; limit in length for single-handed trout rod, 12 feet 6 inches; limit in length for Thames and Nottingham competitions, 14 feet. No allowance in points will be made for rods under and above limits. All the competitions, except the fly-casting, fly-casting and cheese-bait casting, will take place over the grass.

First Competition.—Amateur fly-casting competition with single-handed fly-rod.

Second Competition.—Amateur competition, with single-handed fly-rod, in throwing fly with greatest accuracy and lightness under bushes.

Third Competition.—Amateur fly-casting competition with double-handed trout fly-rod.

Fourth Competition.—Amateur fly-casting with salmon rod.

Fifth Competition.—Amateur competition in casting in the Thames style.

Sixth Competition.—Amateur competition in casting from reel in Nottingham style.

Seventh Competition.—Amateur Competition (open to Thames and Nottingham style) in casting toward a fixed mark. The angler casting the bait nearest to the mark to take first prize; the next best cast made by another angler the second, and the third best cast by another angler to get the third prize.

Eighth Competition.—Professional competition in casting in the Thames style.

Ninth Competition.—Professional competition in casting from reel in Nottingham style.

Tenth Competition.—Competition in throwing the bait with forked stick in the Welsh harp style. Other competitions may be arranged.

TWO BEST CAST ON RECORD.—A stout, portly looking gentleman stood in the midst of an attentive group of friends in a Cortland street hotel yesterday afternoon. He was evidently enjoying the trout streams of his imagination, for his face above his head with the rhythmic motion of a leader of an orchestra. After making several epigrams he evidently hooked a speckle trout and landed him with great applause. Encouraged by his success he began to tell of an unusual capture once made by him, the novelty of which caused the most profound impression. "You know, gentlemen," he said, "that the usual method of catching a trout is from the bank of a stream or out of a boat. Once, however, I captured a very big trout while on a train of cars, he was going up to Pike county, in Pennsylvania. Fishing, as was my custom for many years. The conductor of the train was a brother angler and I rode with him in the baggage car, chatting over the fish we had taken. The conversation turned to those we had not secured. My friend said: 'General, we will soon come to a narrow stream which the road crosses, where resides an ancient and remarkably wary trout. For thirty-six years I have endeavored to hook him without avail. Men have grown thin digging worms to catch him. He dwells under an old log, just beneath the bridge, waiting for the fragments of lunch which fall from the cars. An idea at once occurred to me. I took my rod from its case and put it together, adjusted the reel and tied on a favorite cast, which, by the way, was given to me by Sir Morton Peto when he visited me in this country. I said: 'I'll try the old duffer. Don't stop the train, but let us when we come to the stream.' In a few minutes the train was rumbling on the bridge. The baggage master exclaimed, 'Here we are,' and rolled back the door at the side of the car. I made my cast, gentlemen, and had him, by jove! He weighed over four and a half pounds. It was a big one."—N. Y. Herald.

LEATHER-STOCKING CLUB.—OSWEGO, N. Y., May 18.—At a special meeting held at the secretary's office this P. M. the club decided the following members delegates to the State convention to take place at Niagara Falls, J. B. Merrick, H. C. Tonner, N. A. Wright, Dr. J. D. McManus and G. P. Matteson. The club also passed resolutions of respect for Morgan L. Marshall, deceased, who was one of the founders of the club, in March, 1860. The club voted to have the resolutions nicely engrossed and framed, and send a copy to the family of our departed brother. The prospects for bass fishing in this vicinity are not better, if we could only find a game protector here to guard against pirates who use nets, seines, and any other device they can think of by day or night to destroy our game fish. We could then satisfy the most fastidious fly-caster in America. I hope the Governor will think best to give us a State game protector.—DANIEL BOONE.

IOWA.—Spice Lake.—Last fall I made a report to you of the amount of eggs received at this hatching house, and now according to promise, will state the result: I have had extraordinary success, having hatched out the entire lot, with the exception of the few injured eggs. I have now in the house about 500,000 salmon trout and a few whitefish; have distributed the rest in the various lakes around here. These lakes are teeming with native fish, such as bass, pickerel and pike (wall-eye). The season is opening first-rate for sporting.

—A. A. MOSHER.

**TROUT IN MICHIGAN.**—The following letter has been received by one of the Michigan Commissioners: Kalamazoo, May 11, 1893.—A. J. Kellogg, Esq.: My Dear Sir—It will, I am sure, be gratifying to you to learn that this vicinity is now having some excellent trout fishing. A number of streams in which they were planted three years ago are furnishing a fair supply. Since the 1st of May hundreds have been caught from one brook, and to my certain knowledge they exist in several other streams that have not been fished. And what surprises every one is the fact that they have grown to such size. Quite a number have been taken which weighed over one pound each. I have seen a single one that weighed one pound six ounces, another one pointed four and a half ounces, and another one pound and three ounces. Probably most that have been taken weighed from three-quarters of a pound to one pound. The Commissioners have reason to congratulate themselves on the assured success of their efforts, and I trust the Legislature will be disposed to make a liberal appropriation to enable you to carry on the work so auspiciously commenced. Very truly yours, T. S. Cobb.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

### FIXTURES.

#### WENCH SHOWS.

June 12, 13, 14 and 15, 1893.—Chicago Bench Show, Chicago, Ill. Entries close June 1. Chas. Lucien, Superintendent.

#### FIELD TRIALS.

November 19, 1893.—Kent Field Trial Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1; for the Members' Stake, Nov. 17; for the All-Aged Stake, Nov. 1. W. A. Custer, Secretary. Flatfish, Long Island City, N. Y. November 29, 1893.—Robin's Island Club's second Annual Field Trials at Robin's Island, L. I., for members only. Entries close Sept. 1. A. T. Plummer, Secretary.

November 1893.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Bryson, Secretary, Memphis, Tenn.

### TRACHEOTOMY IN A DOG.

#### Editor Forest and Stream:

The following case of tracheotomy in a dog for supposed laryngeal obstruction may be of interest to your readers. I am not familiar enough with canine surgery and therapeutics to know whether the case was a tracheotomy or a tracheostomy, the first, a valuable red Irish setter, something over a year old, while playing on the grass, was suddenly seized with violent coughing and dyspnea, and in a few moments lay almost moribund of asphyxia. He gave no evident symptoms of laryngeal obstruction, and his life was saved at the time only by the prompt action of his master, who, being called, thrust his finger into the larynx as far as possible, without, however, to his knowledge, having it come into contact with any foreign body. The dog immediately recommenced breathing, and was soon able to stand, though still suffering from severe dyspnea or difficulty in breathing, and still continuing his violent attempts to eject something from the air passages. I was called to see the case at this juncture. By laryngeal inspection I could detect nothing, except intense congestion of the epiglottoid folds at the entrance to the larynx, nor could I feel any obstruction in the trachea from without. The dog was standing, and, but for his violent coughing, was in good condition, wagging his tail, and with characteristic intelligence submitting to be examined without making the slightest resistance. Physical exploration of the chest walls revealed on auscultation the presence of loud rattles in a mucous form, and in the trachea, and in the bronchi. After resorting to the usual methods in such cases, holding the patient by the hind legs in an inverted position, giving an anæsthetic, etc., I gave the animal an hour's rest, as he seemed to be improving again, and in immediate danger. During this interval he ejected three times a considerable quantity of frothy mucus-sanguinolent matter of bright red color, and evidently proceeding from the lungs. The matter contained quite a little grass in blades, and one or two shreds of straw. I made a diagnosis of tracheitis, and of bronchitis, irritation by points of grass or other foreign bodies. Expiration was comparatively easy, but upon inspiration something seemed to close down and prevent the ingress of air.

The breathing soon became labored, and as he was found necessary, two or three times, to open the glottis by means of long forceps with sponge attached. The dog began to show evident signs of exhaustion, and I now saw that operative procedure would shortly be called for, and at once dispatched the surgeon to make a tracheotomy. The dog was lying flat, for a tracheotomy tube. About fifteen minutes later the dog ceased to breathe and became moribund. He was at once thrown upon his back, and an incision  $1\frac{1}{2}$  inches in length was made through the skin and cartilage about the middle of the incision commencing just below the cricoid cartilage. This was accomplished by grasping the larynx with the left hand, holding it firmly, thus making the integument over the parts tense. Four rings of the trachea were cut, and as the instrument entered the windpipe the characteristic sucking sound was heard.

Unfortunately, no tube had arrived, nor were toothpicks or goose quills at hand, and it was impossible to keep the opening into the air passages patent; besides this, the animal was now in *artificial morbus*, his heart alone showing by its fluttering pulse that life was not yet gone. At this critical moment the messenger with the tube arrived, and although I pronounced the dog beyond hope, yet I inserted the tube at once, secured it and started artificial respiration, and gave him demulcents of whiskey. After ten minutes the animal was breathing naturally through the new opening. All this seemed strongly to confirm the previous diagnosis of oedema glottidis, the question of access to the best of the lungs being left to the animal quiet for the next thirty-six to forty-eight hours, and this was attempted by sewing him securely on his back in bagging and suspending him in this position. This being accomplished, two men were appointed to watch him, and after every six hours. The adventitious opening was covered with a large sponge wrung out in a weak carbolic solution, and this was ordered to be changed every hour. About one ounce whiskey was administered hypodermically, and ten drops of Mergal was given.

The animal remained quiet until three o'clock A. M., or about nine hours after the morphine had been given, when I was suddenly called to see the patient, the watcher reporting that the dog had ceased breathing. I went, and found him restless and breathing hard. Examination showed that the tube had slipped from the trachea during his exertions to free himself from his fastenings. The tube was immediately replaced and a minute or two of Magendie administered. The respirations again pupped indicated that the tube was in place, and at this time there was no breathing whatever from the natural air passages. At eight o'clock in the morning, or about sixteen hours after operating, some breathing through the nostrils could be detected. A respiratory catheter, three ounces of milk, one ounce of whiskey, with twenty drops of laudanum were now administered per rectum.

At noon the dog was breathing quite freely through the nostrils, the heart pulsations strong and regular, eight to nine per minute. Progress good. At 6 P. M. everything had

improved. The breathing through the larynx was strong, and upon closing the tube for a few moments by means of a small sponge, the dog gave no evidence of dyspnea, but breathed contentedly through his nose and mouth. The emesis of milk, whiskey and laudanum was repeated, and five minims of Magendie given hypodermically. Everything looked favorably. At 10:30 P. M. I was summoned suddenly by the announcement that the dog had ceased to breathe. I found the brute in a comatose condition, markedly cyanotic and evidently dying of apnoea. He was at once cut loose from his hammock and artificial respiration kept up for over half an hour, while whiskey and ammonia were administered hypodermically. At the end of this time the heart had ceased to beat, it being impossible to force more than the smallest quantity of air into the lungs. The animal died just thirty hours after the operation.

An autopsy was held at once, and the following conditions presented themselves. The laryngeal mucous membrane and vocal cords showed evidence of recent intense congestion and inflammation, considerable ecchymosis about the incision into the trachea. Upon splitting up the trachea, a hard foreign body was encountered just at its bifurcation. It proved to

be a large acorn, with a transverse diameter slightly exceeding that of the trachea. It was rather firmly impacted, with its point downward over the entrance to the left bronchus, and completely occluding its caliber. The base of the acorn lay diagonally over the entrance to the right bronchus. The left lung was completely collapsed and carinated, and of dark reddish color. The right lung showed signs of recent collapse, but was of normal color. Neither lung contained any air.

The division of the trachea into the two bronchi was something over eight inches from the lower border of the larynx, lying deeply below and behind the episternal notch, and beneath the thick muscles of the neck. The condition at the time of operation seem to have been as follows: The lining membrane of the larynx was the seat of an acute inflammation or oedema glottidis, brought on by the passage through it of this large body, increased doubtless by the various manipulations by forceps and fingers to which it had been subjected. Undoubtedly the acorn had, by the violent inspiratory efforts, been forced down to its final resting place, the bifurcation of the trachea, the moment it had passed through or possibly been pushed through the unyielding walls of the larynx. It must have completely occluded the left bronchus from the beginning, but resting diagonally (as per diagram), had allowed the air to enter and make its exit from the right lung. The deep breath which the watcher stated the dog had taken just previous to his collapse, must have sucked the base of the acorn over the entrance to the right bronchus, thus occluding them both. Local inflammation around the acorn aided in narrowing the caliber of the trachea at this point.

The fact of the operation giving relief at once from the asphyxia, was almost proof positive that the obstruction was laryngeal and not below, and hence exploration of the chest by physical signs, except in a suppurative case, at first, was overlooked. Had this been done, the absence of all sounds on the left side might have raised suspicions. In all probability no operative procedure could have saved the dog's life, even had a complete diagnosis been made. How so large a body passed the chorda vocales is a mystery. After death I could, with difficulty, force the tip of my index finger through the larynx. The animal was in the habit of playing with a small rubber ball, throwing it into the air and catching it, and while thus engaged with an acorn the accident must have happened. The operation in itself is a simple one, and in all cases where the obstruction is laryngeal, would be called for, and I am satisfied, with proper care, be highly successful.

MORFON GRINNELL, M.D.

NEW YORK, May 10, 1893.

### THE GORDON STANDARD.

**M. R. DIXON's** letter in your last issue on Gordon standard is very pleasing to me, and I thank him for its character, and I trust that our united efforts may be crowned with success. Mr. Dixon says I ignored stern in my standard. I cannot say that I did, but I should have been more general in appearance. A setter with a teapot tail ought to be very heavily penalized; in fact, I should disqualify him on spot. When I saw him in New York last year, I considered the best of the Gordon setters by long odds, yet I did not consider him my style. I would suggest that a committee be formed of the prominent breeders of the Gordon setters in America, and that they should take into consideration the standards now before the public—i. e., Stonehenge's, Vero Shaw's, Malcolm's, Dixon's, and my feeble effort—and by doing so I think a correct and useful standard would be framed, that all breeders should make it their duty to have used, and at the same time breeders and the public would reap the benefit of it.

This is the only true mode. As it stands at present, exhibitors of the old Stonehenge standard will not exhibit under the later productions; and vice versa, those holders with the later views will not exhibit under the

older ones, so that bench show managers are placed in a difficulty.

This is the only true mode of proceeding, a paper war only can make any pretensions, it can never carry them out, and I am quite sure it will commend itself to all sportsmen as the proper way out of the difficulty which at present surrounds the Gordon setter. J. S. NIVEN.

### CANINE TENACITY OF LIFE.

BY G. D. ALEXANDER.

**T**he first year of the surrender in the late civil war found the old planters of the Arkansas in the most destitute circumstances. They had no provisions and no money, and I chase them—credit was dead as a hammer. Shortly after I had returned from Marshall, Texas, to begin life anew, and prepare for a crop in the fall of 1865, a heavy snow fell. It was a good omen to many a poor planter who was thus enabled to track his wild hogs to their beds, and lay in a supply of meat for the impoverished family. It commenced snowing about bedtime, and I lay awake a greater part of the night, planning with my nephew, Samuel Morgan Alexander, who had recently arrived from Lynchburg, Va., to have a grand wild hog hunt the next day. My pack of hounds would run any animal I wanted them to pursue, from the cotton-tail hare to the biped man. The difficulty in the way was to get them on a hog track before striking that of a deer, bear or wildcat.

By morning the snow was fully three inches deep. The ground was dry and frozen before it commenced falling, and as there was no wind during the night, every tree, shrub and cornstalk was covered. It was just such a snow as I desired, and before sunrise I was in the saddle on a gentle mule, and accompanied by my nephew and two freedmen. I started to a big canebrake where the wild hogs were certain to have bedded in this deep snow.

It was not over a quarter of a mile from the house to the rear of the field, where there was a gate through which I could pass out into the forest, a large body of heavily timbered land densely covered with canebrakes extending for many miles back of the plantation. Along the fence there was a wagon road used for hauling cord wood, that extended about a mile along the fence, and then diverged at right angles until it struck a pretty bayou, down which it lead into the bayou and bayou disappeared into the distance.

Fortunately, just as I passed through the gate, I discovered tracks of two hogs, indicating from their great size that they were several years old. My nephew dismounted, showed the tracks to my favorite hounds, and the woods were open on the way of any thing I wanted her to run, and by all the coaxing I got the entire pack in full pursuit. The hogs had fed along the road as far as it extended by the field, and then continued in the wood to the bayou. After following the bayou for several hundred yards they crossed a creek, and I was confident they had made for the canebrake. Being minus my left arm, which I had left on the banks of the Potomac during the late unpleasantness, it was not so easy for me to ride through the dense woods to keep up with such a pack of dogs, and my nephew, who was armed with a superb shot with both pistol and rifle, having served the entire four years of the war as a member of Munford's First Cavalry Regiment of Virginia, to follow the pack and keep up with them, and to take command of the hounds with me. I should have known as I obeyed to the place where I knew the hogs would be found, Sam obeyed orders, and half an hour's ride brought me in hearing of the dogs, that were then baying the hogs in this dense thicket. He had followed them for some time, as he did not understand me in directing him to shoot the hogs before I should arrive. I instructed him to give me time to ride to the opposite side of the place where the dogs and hogs were fighting. The two freedmen were posted on the flanks, and I was confident that I should have no trouble in going into where the hogs had bedded, and shoot them if possible.

One of my wild hounds on this occasion refused to run the hogs, and instead of following behind my nephew, he ran in front of the pack, and followed them in a perfectly different to the fierce struggle that was going on. The place which they had selected for their lair was one most admirable for their defense. Two large cottonwood trees had been blown down in some storm during the year, and had fallen one across the other. In this cross the hogs had made their bed. The trees were not less than five feet in diameter, and under the upper tree was the bed. All around was as dense a canebrake as I ever got into. The hogs proved to be very old, and I was confident that the animal which I had followed from country I consider the old wild boar is the most dangerous. It was simply impossible for the dogs to do anything with these hogs. They were as impenetrably fortified against the dogs as they held a position against the human hunter. The dogs were entirely conscious of the danger, and kept at a respectful distance, some on the logs, some in front, and some behind the hogs. One of the disagreeable points of a hog hunt in the deep snow is the constant falling of masses of snow from the trees, and the sound of the falling snow was so loud that the dogs were forced to leave the place, and I was almost impossible to keep a muzzle-loader from getting wet and failing to fire.

The actions of my bitch, Venus, had puzzled me not a little in her refusal to move forward to the largest wild boar, and I was the pack. I have often thought she must have had a spiritual warning that some great mishap was going to take place, and it had thrown a damper over her buoyant spirit. At my rate she stuck to the heels of my mule, and it proved the worst of her, and I was confident that I should have no trouble in going into where the hogs had bedded, and shoot them if possible.

I had reached the point I desired and the signal was given. It was some little time before the sharp report of Sam's rifle was heard, and then followed his loud shout, "Look out! He is coming!"

In a moment I heard the cane popping as if a huge bear was bursting through it and coming direct to where I was seated on my mule. The dogs were in full cry; the boar was "booming" as if in great terror, and the gnashing of his great tusks was distinctly audible. My mule got a good start in galloping, and I could neither turn myself in the saddle nor move the mule. I heard Venus give one whine, and at that instant I felt the shudder of the mule. Turning as well as I could to look over my shoulder, I perceived the boar was coming, and I was confident that I should have no trouble in going into where the hogs had bedded, and shoot them if possible. He was a Chester white, and his exit was like some gigantic snowball whirled through the cane with the force of an avalanche. He was so excited that he never saw me, and I paid no attention to Venus, only noticing her coming on behind me as I got my mule in position to follow. I had gone but a few rods when I heard her give a sudden whine. I was convinced she was wounded, and on looking back to see her what I saw was a most painful sight. The boar had run over her, and my mule's tracks. Looking down I discovered the blood spurting from his hind leg, and poor Venus was fastened to a long bamboo briar. Dismounting, I found the wound of the hind leg was a fatal one. I was too late to save her. Her entrails were dragging and the bamboo had caught them, thus preventing her going any further. Here was a dilemma—my mule badly cut, my bitch, one of the best I had, mortally wounded, as I supposed, and the boar, dogs, freedmen and bamboos all in the way. I was too late to save her. I did not do? To leave the poor bitch in that condition would never do. I was fully three miles from home, and in this dense canebrake. An old hunter has many resources under such circumstances, and I was not accustomed to the woods would not think of anything.

I whittled the entrails from the bamboo, put them back into her belly, and then wrapped my handkerchief around the boar, covering the wound with the handkerchief. I then cut the bamboo with my knife, and with my hand, and mouth, tied it, and then tightened the knot with a stick. I determined to

of Governors, or of meetings of the Club, and exercise the usual functions of a presiding officer.

III.—VICE-PRESIDENTS.

The Vice-President shall fill the office of President in the event of his absence.

IV.—SECRETARY.

The Secretary shall keep a record of the proceedings of the Club. He shall keep an account of all members elected, and furnish the Treasurer with the names and residences of members elected and the date of their election, together with any special which may be imposed on members, notify all officers and members of their election, and every Committee of its appointment. He shall attend all Committee meetings and take charge of the correspondence, give notice of all meetings, and transact such other duties as may be required of him or pertaining to his office. His books shall be open during business hours to the inspection of any member. For the performance of such duties he shall receive a salary of one hundred dollars yearly, payable quarterly.

V.—TREASURER.

It shall be the duty of the Treasurer to collect all dues, fines and moneys of the Club, and under the direction of the Board of Governors disburse all funds belonging to the Club. He shall keep all accounts of the Club in books belonging to it, which shall be open during business hours to the inspection of the Board of Governors, or any member thereof. He shall give notice to members who are in arrears for fines or dues, and he shall promptly report to the Board of Governors (the condition of any member's account when the same shall remain unpaid beyond the time specified in the Constitution. At the annual meeting of the Club he shall present a written report of all financial transactions during the fiscal year, with whatever suggestions he may think proper to make.

VI.

All resignations shall be in writing, and addressed to the Secretary, but shall not take effect until accepted by the Board of Governors. No resignation shall be accepted while the member is in debt to the Club.

Amendments to these By-Laws may be made in the same manner as is provided for amendments to the Constitution.

VII.

The meetings of the Board of Governors shall be held the 2d Tuesday of the following months: January, February, March, April, May, September, October, November, and December.

At a regular meeting of the Board of Governors the following resolution was passed:

Resolved, That any man barred by any recognized Field Trial Club in America, or who has been ruled out at the English Field Trial Club's field trials, provided this club shall be officially notified of such disbarment; and such disbarred handler shall not be allowed to run a dog, unless officially reinstated by the club by which he was disbarred.

[TO BE CONCLUDED.]

WITH THE BEAGLES.

"GONE TO THE DOGS."

SUCH might have been said of the writer lately—not in its literal sense, but very literally, because I did not visit my friend and his kennel of beagles—every one of them, also, my friend. Who can look into the honest eyes of a well-bred dog and not recognize him as a friend? Who dares to vilify a dog as unworthy a dog's love, and the man or woman who does not love and respect a well-bred dog—excuses me from defining, for I would be "void of offense."

A bright mid-afternoon in the prime of May found me approaching my desired haven. One by one familiar objects came into view. I saw the old house, the garden, the house, where I was soon welcomed. Not long, however, could I tarry within doors, and leaving rod and traveling implements where they chanced to land, I hurried out to receive other welcome from the "old place." A young man, who I have old Lee (a Maryland foxhound) gave me a true Southern greeting and then took his place at "heel" as I went the "general rounds" of the kennels. "Twa a sight for sair een," surely. The beagle bitch Lucy looked up from her litter of beautiful babies with her soft, pleading eyes, and I could not keep a thought from her last noble litter of ten puppies, now scattered over the country. How pleasant to see them together now, in their grown estate—to be imagined not never to be met again, for the old place is a yard in which seven of Ringwood's get are co-tenants with the five puppies of the foxhound Sue. In truth a noble lot. Blood and breeding are writ upon them, and their little forms and beautiful markings form a picture of the noblest of the breed. I am a great admirer of the long legs, and the result of that pause is now apparent in the shape of a fine puppy sleeping at my feet as I write. Grace, the pointer bitch tethered near, now gives tongue and Sue follows suit, the old beagles make the welkin ring with their "Tis no use to me, and nothing I have done, far, far away from them all. How distinctly pleasant sounds, as far as scenes may be remembered. Now a call on the bitches to be bred, among which I find dear little Musie, the beagle hound, and the pointer bitch, who has been a great help to me in my dog days. I have under my apple-tree, his grave soon to be covered with the fallen bloom. "Lord, keep his memory green."

Then to Ringwood, the beagle dog par excellence, to King, the fox, Colley, the collie, and with what grace and dignity they respond to call and thrust cool noses through the palisades to sniff us. To such dogs as these who would not go—with such who would not stay? A glance, *ex passant*, at Gay, the pointer, and others of his genus, and we come to the quarters of the noble foxhound bitch Lady Bute, as pretty as a picture and suggestive of hard runs over falls and of a handsome progeny. Our way to the house is disputed by Birdie (one of Musie's puppies) and Miss Grumbler, the truly surly puppy of Colley's last litter. They are pretty, but the run of the house and elsewhere are worthy of all the favors and fondling they receive. This kennel, like many others, suffered from the loss of dogs and puppies from the diseased state of some of the exhibits at the last Meriton bench show, and 'tis to be regretted that more care is not taken by the owners of dogs on such and on all occasions. In many cases the health of one is the health of all, and *vice versa*.

Have referred only to the first of my going to the dogs. I can not say no more. My puppy is awake and I cannot resist his pleading for a frolic. To "go to the dogs" is good. "The best part of man is the dog that is in him." O. W. R.

**LONDON DOG SHOW.**—London, Ont.—A meeting of the principal dog fanciers of the city and vicinity was held at the London House on the 13th ult., when it was decided to hold a bench show under the auspices of the Ontario Field Trial Association, which will be about the first week in October next. The following officers were appointed: President, Col. John Walker; Vice-President, G. F. Hiscox; Secretaries, J. Pudicombe and C. A. Stone; Treasurer, David Sweeney; Committee, J. Macdonald, R. H. Gibson, G. C. Chisholm, T. G. Davey, T. H. Smallman, H. B. Harrison, T. Scaulberg; W. B. Wells, Chatham; I. Cousins, G. Burns, Jr., with power to add by their number. A deputation was chosen to wait on the Western Field Trial Association, for the purpose of settling the requirements of the bench show managers, for them, and ask their assistance in furthering the show. As a bench show always does well in London, and has hitherto been most satisfactory both as to exhibition and the proceeds, it is to be hoped that the show will be a success (to use the words of Charles Lincoln) a crowning success.—I.

CHICAGO DOG SHOW.

*Editor Forest and Stream:*

Enclosed I send you the premium list of the above show. Several special prizes have already been donated, and as it is expected many more will be given they will not be published in separate form until all are in. The entries for all specials will be free.

The awards in the regular classes will govern all the specials as far as practicable, and when it is not so the dog will be called into the ring at the direction of the judge. The dog will be judged on the basis of the English kind, being situated near the depot and within easy access of all the principal hotels. The building itself is well ventilated, and a spacious lot or field adjoins it for the proper exercising of the dogs.

As the time is so short between now and the show, the entries will close on the 1st of June, and entries sent by mail must be sent in time to reach Chicago by that date. The P. O. Box is No. 342.

The railroad and express companies have all been written to, and it is expected they will grant the usual facilities.

The great Railroad Exposition will be held during the week of the show, thus affording visitors an admirable opportunity to see Chicago at its best.

The rules and regulations of the show will be the same as used at all other shows.

The Malcolm standard will be used for judging the black and tan or Gordon setter classes.

CHAS. LINCOLN, Supl.

CHICAGO, May 31.

PREMIUM LIST.

Prizes of \$10 and \$5 for mastiffs, rough-coated St. Bernards, smooth-coated St. Bernards, Newfoundland, greyhounds, deerhounds, pointer, and English, Irish and Gordon setter classes; \$15 and \$5 for open classes; \$7 and \$3 for puppies under 12 months; medals for champion Irish water spaniels; open classes, \$10 and \$5; \$10 for champion field and cocker spaniels, \$10 and \$5 for open classes; \$10 and \$5 for pointer, English, fox-terriers (medals for champions), dachshund, bull-terriers; \$10 and medal for black and tans, Dandie Dimmons, Beddingtons, Irish, Skye, hard-haired Scotch, silk or rough-haired, Yorkshire, toy, King Charles, Glen-inn, champion pug, silver medal; open classes, \$10 and medal; poodles, \$10 and medal; miscellaneous, \$7.

**MANGE CURE.**—*Editor Forest and Stream:* In view of the extensive prevalence of mange in the vicinity of Boston and through some other portions of New England also, perhaps a word or two on the subject might be of benefit to some dog owner who is struggling with a desperate case. A valuable pointer being owned by my neighbor, who has been afflicted with dry mange spots about his head during the hot weather of last summer. He called my attention to them, and I applied an ointment made of vasoline, tar and sulphur, and they soon disappeared. During the winter season, later on, the dog was attacked, more violently. The dog has always had the best of care and feed, and the owner can recall no time of his being exposed to contact with any other animal. He was always kept in a large, dry shed, and given plenty of exercise. But in the same way, the dog was kept in a large, dry shed, and given plenty of exercise. The dog has always had the best of care and feed, and the owner can recall no time of his being exposed to contact with any other animal. He was always kept in a large, dry shed, and given plenty of exercise. But in the same way, the dog was kept in a large, dry shed, and given plenty of exercise. **AMERICAN COCKER SPANIEL CLUB.**—Toronto, May 18, 1883.—The Produce Stakes for 1883, decided at the Westminster Kennel Club Show in New York this month, resulted as follows: First prize, Hornell Spaniel Cocker, Italy; by Bob H. out of Lady Roda; second prize, F. P. Fisher's Black Silk, by Obo out of Chloe II.; third prize, by W. Leavitt, by the Black Glen, by Obo out of Chloe II.—J. F. Kirk, Secretary American Cocker Spaniel Club.

**"AMERICAN KENNEL REGISTER."**—Entries for the June number should be sent in now; none can be received later than June 1. The two numbers of the Register already published contain pedigrees of 135 dogs, with prize lists of the Washington, Ottawa and Pittsburgh shows, N. A. K. Derby entries, etc., etc.

**PRESENTATION.**—Mr. Dummell, the gentlemanly and efficient clerk of the New York hench show, has been presented by the managers with a beautiful gold badge which bears the inscription: "From the managers of the New York Hench Show to Walter T. Dummell, in token of their appreciation of his faithful and valuable services."

#### KENNEL NOTES.

##### NOTICE TO CORRESPONDENTS.

Kindly notes are desired in this column of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of each animal:

1. Color.
2. Name and residence of owner.
3. Age.
4. Sex.
5. Date of birth, of breeding or, 5. Date, with sire and dam.
6. Owner of dam.

All names must be plainly written in communication on one side of paper only, and signed with writer's name.

##### NAVES CLAIMED.

### MUZZLE vs. BREECH-LOADERS.

Editor Forest and Stream:

Will you allow a stranger to your columns to say a word or two on the subject of Muzzle-loaders vs. Breech-loaders?

Having by chance received the letter of Major Merrill in your issue of April 30, 1883, I read the same with a great deal of interest, and although what he says has a great deal of truth in it, still, in my opinion, he draws too broad a distinction between the two arms, and all in favor of the muzzle-loader.

Not having seen the previous communications referred to, I do not know what may or may not have been claimed by him previously for the muzzle-loader, or by others for the breech-loaders; so I must confine myself to this letter.

As I understand it, this is muzzle-loader pure and simple, with its proper ammunition and without artificial reefs, fancy loading-tools, fancy sights, and the like. The gun, plain sights, ammunition and the man behind it to hold and shoot, against the breech-loader under similar conditions, and excluding everything but what could be carried and used in the field as a hunting weapon against either large or small game in all kinds of weather.

Major Merrill sums up his claims in eight counts, so let us see what can be said concerning them.

I have a Baker three-barrel gun, weight 9lbs. 12oz., 30in. barrel, cal. .45, chambered to take a .25in. shell, and I find by reference to the catalogue that I can get the same gun for the same price, ranging from 30lbs. powder and 25lbs. lead, to 30lbs. powder and 25lbs. lead, all of which will fit and shoot from my gun, so I have a pretty wide range of choice for ammunition suited for my gun, and still use manufactured ammunition, that comes within the rules of naked bullets, and, by buying shells and bullets, such as the market affords, I can get the same results as the breech-loader, and I can get it as little lead, or vice versa, as I may desire. I have used fixed ammunition as follows: 30-220; 35-405; 70-100; 70-500; 80-500; and there can be no doubt but that the muzzle-loader can be made to do as well as the breech-loader, and I can get it as little lead, or vice versa, as I may desire.

Concerning the second count, I find that the muzzle-loader is reloading with bullets that can be purchased I can carry any of the above to suit myself, up as high as 100grs. powder and 40grs. lead. I find that the muzzle-loader is reloading with bullets that can be purchased I can carry any of the above to suit myself, up as high as 100grs. powder and 40grs. lead. I find that the muzzle-loader is reloading with bullets that can be purchased I can carry any of the above to suit myself, up as high as 100grs. powder and 40grs. lead.

Concerning the third

500yds.....	4 5 3 4 5 4 5-30	900yds.....	2 4 3 0 5 8 0-17
600yds.....	4 0 5 4 4 2 2-20	1,000yds....	3 2 5 4 3 3 0-20-148

After a day's rest the competitions were renewed on May 17, and the record ran:

Aug. 21, '22, 23—American Canoe Association Regatta at Stoney Lake.  
Aug. 24—American Canoe Association Meeting at Stoney Lake.

### A WORD TO CANOEISTS.

IN response to the numerous demands from our canoeing friends, we open a department to which it is intended to devote such space as the growing importance of the subject shall demand. We propose to give all the news, and to that end invite the owners of canoes, secretaries of clubs, and others, to favor us with intelligence relating to new boats, proposed trips, club transactions, races, meetings, etc., etc.

From week to week we shall publish lines of new boats, descriptions of novel rigs, hints and help for owners and builders, and such other matter as will insure the practical usefulness of the FOREST AND STREAM to "the fraternity."

Correspondents are invited to send us for publication, reports of cruises, with all available information respecting desirable canoeing routes and cruising waters.

THE DOT.

WE publish this week the lines of the Dot, owned and sailed by Mr. C. B. Vaux, commodore of the New York C. C. This canoe was built by James Everson, of Williamsburgh, in 1878, and was the third boat of the well-known Shadow model designed by Mr. W. L. Alden, New York C. C.

The first cruise was from New York to Rondout, in 1878, and in 1880 she made a cruise on the Susquehanna, from Binghamton to New York City. The following year she sailed to the Chesapeake, and made short cruises, besides several of some length. Her first race was the regatta of 1879, in which she was beaten by boats with larger crews. In 1880 the keel was increased to 26 ft., and at present, which is the last she has had, it is 30 ft. long. She has been in the regatta nearly every sailing race in which she has entered, including four for the Challenge Cup, besides winning all of the sailing prizes not only in the regatta but in the annual regatta of the New York Yacht Club, was fifty miles in ten hours under sail and paddle, from New York down the Sound. Mr. Vanx was one of the first in this country to use the "dory" for a boat, and he has been successful in many races for balance lug, the present rig, which we will illustrate next week, consisting of two balance lug sails of 70 and 25 sq. ft. She was also the first to use the "dory" for a boat, and she was the first to use the following are her principal dimensions:

	Length over all	Ft.	In.
Born at waterline	14	4	0
Beam at deck	20	4	0
Depth at bow	28	0	0
Depth at stern	104	0	0
Depth amidships	96	0	0
Depth of keel	23	0	0
Distance from fore side of stem—			
To forward hatch	1	6	0
To center of mainmast	2	6	0
To forward bulkhead	3	6	0
To fore end of coaming	4	6	0
To sliding bulkhead	8	10	0
To after end of well	10	3	0
To bulkhead	10	10	0
To center of mainmast	11	6	0
To after hatch	11	6	0
To after hatch	12	9	0
Weight of hull when in use, 93 lbs.			

TABLE OF OFFSETS FOR CANOE DOT

Half Breadths.					Diagonals.		
Depth at (cunvale).	Deck.	L.	W. L.	No. 2.	No. 3.	Diagonals.	
						A. B.	C. D.
19		54	43		36	73	62
18	64	103	98		8	108	108
17	114	14	13		11	154	124
16	139	15	133		115	159	124
15	14	142	138		105	134	114
14	127	123	104		72	131	104
13	136	98	44			86	76
12	158						
11	19						

The above measurements include the thickness of plank,  $\frac{1}{4}$  in., which must be deducted in making the moulds. The depths are measured from bottom of keel. In building from the drawing it should first be laid down, full size, on a large piece of paper, the above table being used for the heights and breadths; the bulkheads, hatches, etc., drawn in their proper positions, and all the lines properly faired before commencing operations.

The keel, stem and rudder are made of oak, plank 1/2 inch wide, 1/4 inch thick, planking lapstrake, planks on each side, 1/4 inch; decks and hatches, 1/4 inch, ribs of oak, 1/2 inch, spaced 6 in. apart. Many changes have been made in the boat as experience has shown them to be necessary: the fore bulkhead, shown by dotted lines, has been removed, the fore hatch permanently fastened down, 1/4 in. of keel added, foremast tube shifted forward 1/2 inch, the old steering gear, 1 1/2 to 2 1/2 in., below deck, with a yoke on deck and one below, replaced by a 2 1/2 in. yoke below deck on a vertical pivot, and the elliptical well entirely changed, with the hatches changed to one with a pointed, flowing coaming, with an apron. The paddle used for several seasons past has been 5 ft. long.

FROM VERGENNES TO LORNA ISLAND.

THE new feature of FOREST AND STREAM in devoting an entire department to canoeing is to be commended, and in response to request for logs of cruises I submit the following: the route traversed being from Vergennes, Vt., via Otter Creek, Lake Champlain, Lake George, to Lorna Island and the canoe meet of 1882. To the numerous canoeists who have cruised upon these beautiful waters this will contain nothing new; but it is written in the hope of inducing others to go and do likewise.

The fleet consisted of two canoes, a canvas-decked Shadow and an open St. Paul, both manned by green canoeists who proposed to travel leisurely and enjoy themselves rather than hurry and destroy the pleasure of the trip. By the toss of a coin the crew of the St. Paul acquired the title of "commodore," while his mate was content to figure as the "vice."

At seven o'clock, P. M., after a long day's ride by rail, the crews embarked on Otter Creek below the falls at Vergennes, the Vice first stopping to take a picture of the falls, for having been initiated into the secret of the falls, he was anxious to show it to his friends. He was startled on the cruise without a canoe as to leave the caucera behind. Vergennes, by the way, is one of the oldest and smallest cities in Vermont, and is situated on the shore of Lake Champlain, Burlington, and eight miles from Lake Champlain, at the head of navigation on the creek, a sluggish, muddy stream with marshy borders. After an hour's passage, the canoes were halted ashore, and their crews were told to tumble overboard with their paddles and to bring up a tent. The night was warm, but they didn't sleep; oh, no! They simply fought and were vanquished by a band of unfamiliar Ver-

port mosquitoes were evidently naïves. After a two-hour, hasty breakfast eaten, and the voyage resumed. The mouth of the creek was soon reached, and away in front stretched the waters of Lake Champlain unfurled like a vast, shimmering sea. The boatmen, however, were not to be lulled. Cassin, back of this ancient stone house, and on the shore of the creek a busy mill, while across the lake loomed up the majestic, snow-capped peaks of the Adirondacks. The camera captured the picturesque view with the camera, they proceeded up the river. The marshy Vermont shores gradually gave place to rugged rocks, and the cool, gray water entered for dinner and a refreshing bath. Continuing slowly up the river, they reached the town of Ticonderoga, famous for Fort Henry, a digmy mining town, which was reached late in the afternoon, after some hard paddling against a head sea. Then a favoring breeze sprang up, and they sailed on to the town of Plattsburgh, to Chimney Point, and at a seasonable hour the tent was pitched on Crown Point, where all hands turned in for a good night's rest with the

Camp Comfort, as it was appropriately named, was delightfully situated upon the abandoned camp ground near the old fort, and overlooking a bay just above the light. Ideas were made, was occupied in lounging about, reading, writing and taking pictures. A leisurely afternoon's paddling covered the sixteen miles between this point and Fort Ticonderoga, where the night was comfortably passed at a hotel. Next morning a visit to the historic ruins was in order, and some pictures were, of course, taken, not omitting the gloomy

underground room, two good views of which were obtained with some difficulty. The paddle up the creek, dinner at Ticonderoga and portage across the carry, occupied half a day, and afternoon found the canoees dancing on the rough waters of Lake George, with great black clouds hanging over the mountain peaks and showers in prospect. The grand scenery was new to both canoeists, and paddling on they gave themselves up to the enjoyment of the hour regardless of the gathering storm.

At once the rain came down in great drops, and the waves rose to violence. Then they hurried ashore only to be thoroughly drenched, with all their luggage; but the grand experience of a storm at sea was not to be missed. Next day the party, including the hospitable Roger's Rock Hotel put all to rights. A steamer here was more slow paddling against a head wind, more grand scenery, more rain, and then a night at Hulet's Landing, with its cluster of cypress trees, and a morning of rain, and a night at Crowsnest, where a race was reached in time for the C. A. race. Of course, the party consumed on the trip than many would have taken, but it was all the more thoroughly enjoyed. Of the canoe men there is nothing new to be said. Everybody was a good swimmer, and a good hand stroke, and again with the gear carried away the liveliest and best of the happy hours spent in company with new-made friends. At Stony Lake, next August, will be a repetition of the scene on a larger

scale. The word to every canoeist: Don't neglect to carry a camera when you go on cruise, as with it you can perpetuate the scenes visited and recur to them again and again. The results of this trip I have before me as I write, and again I look upon the rocks and falls at Veronique, the old Fort Cassin house reflected in the mirror-like waters of Lake Champlain, Crown Point light with its pretty surroundings, the grim ruins and gloomy cavern of old Fort Ti, some of Lake George's grandest scenery, the tents and banners among the trees in Lorna's camp, the beautiful falls of Chubbuck. Photography is a most useful and pleasant companion of canoeing, and he may enjoy it who will. Try it yourself.

CLAYTON

LOWELL, Mass., May 12, 1883.

CANOE SPARS.

CANOEISTS are divided in opinion as to the best material for masts and spars, some advocating bamboo, and some worked spars of pine or spruce. Whatever advantages selected bamboo may have over the others, there is no doubt that a good spruce stick is better for nearly all purposes than such bamboos as can usually be had in this country. Those found in the fishing tackle stores are from 12 to 20 ft. in length and from  $\frac{3}{4}$  to  $\frac{5}{16}$  in. in diameter at the butt, but taper so rapidly toward the small end, so that they are useless for anything but being cut into small pieces for the head. Occasionally they may be found of nearly uniform diameter, but they are not regularly imported in quantity as the others are.

Owing to the quick taper, a bamboo spar is never of the proper shape, being too large at one end and too small at the other, and they are very apt to be full of small worm holes, perhaps not easily detected, but fatal to a spar. A neatly made and well-proportioned worked spar is at once strong, light and handsome. Pine is lighter than spruce, but not so strong, and the latter is to be preferred.

For a canoe of 30 to 35 lbs., the gun as now rigged the mainmast should be 2 in. in diameter at deck, and if for a big sail or gaff, 1 in. at head, tapering very gradually from the deck to about two-thirds of its height, and then more rapidly to the head. The mizzen may be 1½ in.; the fore-and-aft mast, 1½ in. at base, tapering to 1¼ in. at head. If the boat is to be used as a dayboat, as it is often done, as there is seldom occasion to set the latter forward. Booms of 8 to 10 ft. should be 1½ in. in diameter at one-third from the after-end at deck, tapering to ¾ in. at the ends, and varies the same. For mizzens, 9 ft. long, 1½ in. at base, tapering to ¾ in. at top, will be sufficient. Varies and boom-ropes should be made of three strands, each strand being of four wires, perfectly smooth to allow the rings and pulleys to run easily. Jointed spars are never so strong as whole ones of the same weight, and will not bend as evenly and fairly, while the best made joint possible will still be liable to break under strain. A good rule for the joints of the foremast is impracticable, and stays on deck must be resorted to.

## VARNISHING BRIGHT BOATS.

THE first point is to clean the boat, thoroughly scrubbing with hot water and soap if necessary, until all dirt is removed, then washing with clean water. After all repairs have been made, the old varnish should be sandpapered or rubbed down until it is perfectly smooth, unless the former coats were too thick, in which case the boat must be scraped with glass or a steel scraper. After sandpapering the new varnish should be rubbed down with a cut of two of shellac. For varnishing, a spot free from all dust should be selected, in a dry place and out of the wind.

The best varnish for boats and outside work is spar composition, of which there are several makes. Crockett's, and Pratt & Lambert's are both good. The varnish should be laid on in a thin coat, and allowed time to harden thoroughly before applying a second coat. It is better to put on one coat on an outside surface of a boat, renewing it when necessary, rather than putting on several thick coats at one time. For new work there are several preparations in the market known as wood fillers, preservatives, etc., in which the varnish is incorporated. These are useful in some instances, but in general require less of the latter, and giving the best composition. A newly varnished surface should never be exposed to a hot sun, or it will blister badly.

[illegible]

**THE UPPER CONNECTICUT.**—In answer to an inquiry in last week's issue concerning the Upper Connecticut, our correspondent, "Flick Flick," of Hartford, writes: "From Dalton, N. H., to Waterford, Vt., is a piece of rapid water called Fifteen Mile Falls, which is a dam to carry round, and at the end of the 'Falls,' where there is a carry of about one-half mile, unless the canoeist is a skillful paddler and knows the locality. The scenery is very fine on both sides, and the water is very rapid. The banks are high and steep, and boulders, many of the latter having been tumbled by the Connecticut River Lumber Company to allow them to get their logs down. The water is very cold, and it is not until the water is very low later in the season, and just now many logs will be run, which

**NEW YORK (C)**—Nine active members have been added to the club this season and four associate members, nearly all of whom are canoe owners. A handsome trophy has been presented to the club by Mr. Frank Jones, as a prize for junior sailing races. It is of silver, with the name of the club on the top and the initials "C. C. C." and the inscription, "New York Yacht Club, Junior Sailing Trophy, 1887," in blue, on the face. It is open to any amateur within fifty miles of New York City, and the trophy will be awarded, of course, on the details of the racing being left to the executive of the club. The donor also suggested that it be raced for on each alternate Saturday through the season with a final race in the fall, open only to those who have won one of the previous races, the last one to determine the ownership.

**THE A. C. A. MEET.**—We have received from Com. Edwards a map of St. George's Lake and the surrounding country, and also one of the camp grounds and regatta courses, both of which will be published shortly in our columns. A meeting was held in Peterborough on May 16 to arrange for the reception of canoeists coming to the meet in August. That the Canadians who have visited Lake George seem to fully appreciate the hospitality shown them by our canoeists, and are making every preparation to return it with interest, is shown by their remarks at the meeting. A reception committee was appointed, and the meeting adjourned to meet the following Tuesday.

**CANOEES VERSUS SAILING BOATS.**—The success of the Pearl in the mixed races of the Thames Valley Sailing Club, as mentioned last week, has created so much dissatisfaction among the owners of the other boats that the club has decided to hold only one class of races for this season, an offer that has been promptly accepted by the gallant sailormen of the T. V. S. C. Mr. Tredwin will try his luck in a new gig, however, and it is to be expected that the plucky, persistent crew will be able to make a record that will be a display in the Pearl will make as good a record for the new Fedora.

**SAN FRANCISCO C. C.**—The canoe season in San Francisco has about closed, as the strong winds from June to October make sailing and sailing a hard work. The club now numbers eight members and has a few canoes.

OSWEGO, N. Y.—The first cruise of the Oswego Y. C. will take place on the 26th and 27th inst. Fairhaven is the port which all the yachts will make for, where the orders to be observed on their return voyage will be given.

F. C. DeV., New York.—Write to Kennedy Smith, Eustis, Me.

# Reliable Testimony

Hop Bitters Co.,

Philadelphia, Pa., Sept. 6, 1882.

I am seventy-four years old, have lived thirty-four years in Philadelphia, and well-known among terrans. I have been troubled twelve years with a white swelling on my right foot, and getting worse every year, and very painful, and breaking out in hot weather. I consulted several doctors and they told me it was incurable and I would have to take it with me in the grave. Some time ago I lost my appetite, was costive, had headache and fever—in fact was very sick. I saw in the German *Booster* that Hop Bitters was what I needed. I got a bottle, took it one week and was as well again as ever, and to my greatest surprise right from the first my swelling went down gradually, and I taking another bottle got entirely well of it. The wife of my neighbor had two such swellings on her legs and three bottles cured her. I think this is a great triumph for your bitters. JOHN STOLL,  
No. 1 Young's Alley, above Willow st.

Stippshill, Ind., Nov. 13, 1881.

Dear Sirs—I have read so much about Hop Bitters, and always being afflicted with neuritis, weakness, diseased stomach, never having much health I tried a couple bottles; it has strengthened and helped me more than any medicine or doctor. I am now on my third bottle and am thankful that it has helped me. I will advise all that are afflicted to give it a trial. LUCY VAIL.

Heat the World.

Rockville, Conn., March 6, 1882.

Hop Bitters Co.,

I have been taking your Hop Bitters for several weeks, and they heat the world.  
L. S. LEWIS, Lewis' Axles Machine.

Leontina, Pa., April 13, 1882.

Hop Bitters Co.,

I have not been well for three years, tried almost every kind of patent medicine and no less than seven doctors, one of Elmira, N. Y., none have done me any good. I finally tried your Hop Bitters and found them just the thing. I have praised them so highly there is a great number here who use them with great benefit and satisfaction.  
Very respectfully yours, R. HUNT.

GENTLEMEN:—The "Hop Bitters" meet with large sales and give general satisfaction, one case in particular you should know of. Mr. John B. Green, 728 Spring Garden street, Phila., Pa., has been suffering from kidney affection, which superinduced rheumatism. He tried physicians and remedies in vain. He was obliged to take morphine to induce sleep; his trouble was so great. Reading your advertisement in the *Christian at Work*, he was prevailed upon by one of his daughters to try it. Three bottles affected a cure, and now he is an enthusiast for "Hop Bitters." He is one of the oldest residents in the locality named, and known as a gentleman of unusual probity. HENRY TORREN,  
672 North 10th street, Philadelphia, Pa.

Office Jellows Mutual Aid Association,  
Jellows, O., Feb. 18, 1882.

Hop Bitter Manufacturing Co.,

I have been using your Hop Bitters and find them what you recommend them to be for kidney disease, viz.: superior to all others.  
J. L. HILDEBRAND.

Vertigo, Dizziness and Blindness.

Office *Utica Morning Herald*,  
Utica, Feb. 18, 1882.

I have been troubled with vertigo since last July, and have suffered greatly every night after any considerable exertion from dizziness and blindness. I tried two bottles of Hop Bitters, and since then have been entirely relieved.  
Respectfully yours, J. J. FLANNAGAN.

Hop Bitters Co.,

June 15, 1881.

I have been suffering five years past with neuralgia, liver complaint, dyspepsia and kidney complaint, and I have doctored with fourteen different doctors who did me no good. At last I tried Hop Bitters, and after I used a few bottles I received a great benefit from them, and if I had used Hop Bitters regularly I would have been well before. I know them to be the best medicine in the world for nervous diseases of all kinds. JAMES COONTS,  
Beelington, Barber County, W. Va.

Wicked for Clergymen.

"I believe it to be all wrong and even wicked for clergymen or other public men to be so. In giving testimonials to quack doctors or patent medicines, but when a really meritorious article composed of valuable remedies known to all, and that all physicians use and trust in daily, we should freely commend it. I therefore cheerfully and heartily commend Hop Bitters for the good they have done me and my friends, firmly believing they have no equal for family use. I will not be without them."  
Rev. B. R.—, Washington, D. C.

A good Baptist clergyman of Bergen, N. J., a

strong temperance man, suffered with kidney trouble, neuralgia and dizziness almost to blindness over two years after he was advised that Hop Bitters would cure him, because he was afraid of and prejudiced against the word "bitters." Since his cure he says none need fear but trust in Hop Bitters.

My wife and daughter were made healthy by the use of Hop Bitters, and I recommend them to my people.—Methodist Clergyman, Mexico, N. Y.

Had severe attacks of gravel and kidney trouble; was unable to get any medicine or doctor to cure me until I used Hop Bitters, and they cured me in a short time.—A distinguished lawyer and temperance orator of Wayne County, N. Y.

## MANN'S Trolling Spoons.

Sixty varieties manufactured, suitable for trolling for all kinds of fish that will take an artificial bait. Our Perfect Revolving Spoon is undoubtedly the best general spoon for trolling fish ever offered to the public.

Three sizes made—No. 20 for bass, pike, pickerel, or any fish under five pounds weight; No. 21 for large fish; No. 22 excellent for deep water fishing.

BEWARE OF IMITATIONS.

None genuine except with JOHN H. MANN'S name stamped on every spoon.

# AMERICAN Kennel Register.

A monthly record of kennel events for the information and guidance of breeders, exhibitors and owners of all breeds of dogs.

Its leading feature is the "Pedigree Register," of sporting and non-sporting dogs, which makes it the only complete Stud Book issued in America. A register number is given to each dog, and an index will be compiled at the close of each annual volume, thus forming a permanent work of reference. The pedigree registration fee is twenty-five cents. The first two numbers of the *Register* contained the pedigrees of 138 dogs.

Departments are also provided for the registration of stud visits, dogs at stud, births, sales and transfers, dogs at sale, and deaths.

Prize lists of all the American shows will be given, with descriptions of the principal winners and dogs exhibited; also prize lists of important shows abroad. This department will include a record of field trials. The first two numbers of the *Register* contain prize lists of Washington, Ottawa and Pittsburgh shows.

The publication day is the fifth day of each month; and nothing can be received for publication later than the first day of the month. All matters intended for publication should be in the hands of the editor at the earliest practicable date. Entry blanks for each department will be furnished free on receipt of stamped addressed envelope.

TERMS.—Issued by yearly subscription only. The subscription price is one dollar per year. Make drafts and money orders payable to the Forest and Stream Publishing Company. Address, AMERICAN KENNEL REGISTER, P. O. Box 2,832, New York City.

## ANGLING TALKS: BEING THE Winter Talks on Summer Pastimes

Contributed to the FOREST AND STREAM

By GEORGE DAWSON.

CONTENTS:

Simple Wise Men, About Bass, About Grayling, A Memory, Reminiscences, Odds and Ends, About some Distinguished Anglers of our Time, About Salmon Fishing, Salmon and Sea Trout Haunts and Habits, Several Relevant Topics, Angling Mishaps.

Extract from the Preface:

"The 'Talks' attracted wide attention at the time of their publication in the angling columns of the *FOREST AND STREAM*, and were received with very cordial appreciation. It is thought that their collection into the present more permanent form will prove acceptable. These 'Talks' are brimful of many, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perceives the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia*: he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one."

Limp Cloth, 78 Pages, sent postpaid on receipt of price, 50 Cents.

Forest and Stream Pub. Co., 39 Park Row, N. Y.

## DECORATION DAY.

YESTERDAY the green turf on a million graves was made more beautiful by the tender offerings of loving hearts to the memory of the dead of long ago. In village, in town and in mighty city, all over country, in the North and the South, the East and the West, the loveliest flowers of spring were scattered over the graves of those who have gone before, but whose memory cannot die.

To the white-haired father on this day comes up as vividly as ever the recollection of his bright-faced boy, who went from his home at the first call of battle and who never returned. The widow still mourning the stalwart husband, whose duty to her and the children kept him chafing at home until the struggle had assumed such mighty proportions that he could no longer hesitate. Then he went, and was never again seen alive. The mother whose sole support was torn from her by the conflict; the sister who gave up her darling brother, on this day suffer again the pain of their bereavement.

The flowers which have been scattered over the graves of the blue and the gray have not yet faded. Still fair and fragrant they fitly symbolize the sad, sweet recollections of those who, after twenty years, sorrow for their dead, yet not as those without hope.

Bitter and savage was the struggle, terrible the meeting of opposing forces during the long years of the war, and deep the animosities engendered by the conflict. The whole fabric of the nation was shaken to its foundations, the best of its citizens on both sides yielded up their lives. But the fury of the battle is long past and forgotten, and peace and prosperity smile over our whole land. The mourners of the North and the South mingle their tears and their offerings on this Decoration Day, and the survivors of the struggle on either side clasp hands in strong friendship and good feeling, for the heart-burning and the bitter sectional hatreds of former times have passed away to return no more forever.

## THE BOY AND THE ANGLE.

NOT solely for the scientific angler with his eight-ounce rod, silken line and flies cunningly fashioned to resemble no living thing, are all and the chiefest delights of the gentle pastime. There is one of humble estate in the brotherhood of the angle who makes no pretensions to skill, and uses the most unthought and coarsest tackle, to whom it yields supremest enjoyment. He never cast a fly, and knows no "green drake" but him of the duck pond, no "doctor" but the village practitioner who gives him an occasional nauseous dose, no "professor" but the "deestriet" school-master, and if he ever heard of a split bamboo, thinks a split pole must be a poor stick to catch fish with. He wants no reel to wind in his fish with, but "yanks" them out and lands them high and dry and safe from return to the flood, casting them the length of pole and line behind him. This is, of course, our young and unsophisticated friend, the boy of the country, who remains a boy till he has grown big enough to go a-fishing, and perhaps never becomes a young gentleman, but keeps a boy's heart within him, and a boy's ways until he becomes a man. He does not always wear a torn hat, nor always trousers in which he feels most at ease if sitting down when big girls are about, nor does he always go barefoot from spring till fall, though he likes to give his naked soles a taste of the soil for a few days when he has seen the necessary seventeen butterflies.

Furthermore, we do not claim for him, nor does he for himself, that he can catch more fish than the scientific angler; but how he loves to go a-fishin', and how he enjoys it all, from the preparative beginning to the very end! What happiness is his in the cutting of the pole in the always-pleasant woods, where many a sapling is critically scanned and many a one laid low before the right and fore-ordained one is found; and in the buying of the ten-cent line and half dozen beautiful blue fish-hooks, selected with much deliberation from the tempting array in the showcase of the country store. How continually is he full of anticipation of sport from the moment he begins digging his bait; each big worm unearthed and going into the leaky coffee-pot promises a fish, and as he hurries across the fields to the stream he cannot stop even to look for a bird's nest, though sparrow, bobolink and meadow lark start from almost at his feet. Nor hardly can he halt to disentangle his hook and line from the fence or bush they are seen to catch in, for he knows the fish are waiting for him. Then out of breath beside the stream he impales a lively worm, spits on it, not so much for luck as in deference to time-honored usage, gets his line straight out behind him, and sends it with a whizz and a resounding "plung!" of the two-ounce-sinker far out into the waters, and waits for a bite with what patience a boy can muster. Presently perhaps the expected thrill runs up his angle to his hands and through all his nerves, the tip of the pole nods, then bows low to the flood, and by no "turn of the wrist," but by main strength and by one and the same motion he hooks his victim and tears it from its watery hold. So swiftly has it made its curved flight over his head, unseen but as a dissolving streak, that he knows not till he has rushed to where it is kicking the grass whether his prize is a green-and-golden-barred perch, a gaudy-mottled pumpkinseed, a silvery shiner or an ugly but toothsome bullpout, gritting his wide jaws when his horns do him no good, though they may yet do his captor a mischief.

Whatever it may be, he glasts over it as much as any man over his well-fought trout or bass, and straightway runs to cut a forked wand whereon to string it, and takes care that it be long enough to hold many another. If the fish do not bite he sets his pole in a crocheted stick and lets it fish for itself while he explores the shore and catches a "mud turtel," "almost" kills a "mush rat" or scares himself with a big water snake.

Returning to his pole, perhaps he finds the tip under water and tugs out a writhing eel, the wild fun and horror, and the abominable, all-pervading sliminess of whose final capture makes memorable the hour and the day thereof. Perhaps a hungry and not too fastidious pickerel or picker-pere or bass may gorge the worm-induced hook and be hauled ashore, and then the measure of the boy's glory is filled and the capacity of his trousers to contain him tried to the utmost.

Though he goes home with a beggarly account of small fry dangling at the end of his withe, he is unabashed, if not proud, and hopeful for another day. But if it is strong so full that his arms ache with lugging it, what pride fills his heart as he displays his fish! Till they are eaten and digested he ceases to be a "no-account boy." He cleans them and enjoys it. Every scale is a cent, bright from the mint, and he catches each fish over again as he takes it up. He

recognizes his worms in their maws. When they are cooked, whoever tasted fish so good?

The boy is no more a contemplative angler than he is a gentle one, and he does not of choice go fishing alone. He would rather go with the renowned old fisherman of the neighborhood and learn something of the mysteries of his art, but that worthy does not overmuch desire the companionship of youthful anglers. So perform the young fisherman goes with another boy and has some one to "holler" to, compare notes with, and enter into rivalry with, and he can say with truth, when he gets home, "Me and Jim ketched twenty" though he forgets to add that Jim caught nineteen of them. Wherefore not? Do not his bigger and batters brag of scores which would not have been made if their guides and oarsmen had not fished?

Alack, for the bygone days! When May comes with south winds and soft skies and the green fields are dotted with the gold of dandelions and patched with the blue of violets, and the bobolinks are riotous with song over them, who would not be a boy again just for one day to go a-fishing?

## STEAM YACHTING.

IN unsympathetic quarters the query is often heard, "What are steam yachts good for, anyway?" Such an interrogation would hardly have been made more than once had a little thought been bestowed upon the subject. Though different in some features from the sister branch of the sport, it does not follow that yachting under steam is in anywise inferior to sailing, either in respect to enjoyment or to the opportunities offered for instruction to the mind and healthful exercise to the body. To be sure, the greater certainty of movement under steam, the precision upon which one can count in all that relates to time, removes from steam yachting that charming element of uncertainty which contributes so much to the romance of the more Bohemian-like cruise under canvas. If steaming eliminates speculation upon time and the weather, it is none the less exacting and enticing in other respects. Navigation, such as keeping the vessel's reckoning, skilful pilotage, a knowledge of seamanship in the event of accident to the machinery, all afford field enough for thought, and, supplemented with an investigation of the "power behind the throne," a world of study for the busy brain and nimble activity, for nerve and muscle in quantity unstinted. Indeed, the speed of the steamer demands from the controlling mind a sharpened intelligence, quick decision, a head capable of thinking more than one thought at a time, prepared in an instant to meet an unexpected situation with just the right move in remedy. Thought must flash and work as if by instinct, for time to reflect and evolve from one's inner consciousness is too precious for such waste when slashing along at fifteen, eighteen or twenty knots to the hour. On the bridge watch has to be kept more searching and strict than in the cockpit of the yacht under sail. Emergencies occur not with gear and sails perhaps, but equally as serious, may far more dangerous or sudden in their consequences, in the boiler and engine room below. Pumps cease to act, valves leak, tubes blow out, grate bars choke, bearings heat, keys work loose, and a hundred and one other troubles occur familiar to all who have had motive power in charge. The engine room is not one whit more free from mishaps or accidents than the spars and gear of a sailing craft, and to meet untoward complications in a steamer requires even greater knowledge and experience of head and deftness of hand. In management and care the steamer stands exponent of a higher branch of learning and skill than the simpler demands of fore and aft rigs and smooth water sailing aspire to. Though the steamer disdains without risk nearly all weather prognostications, and shows a thoughtless front to sea and wind, her speed and motive agent involve the assumption of cares and responsibilities at least as great and serious as all those trials and tribulations peculiar to the sailing yacht.

It will be said that owners keep clear of the engine room, care nothing about machinery and delegate all attention it requires to a person employed for the purpose. That asking a man of business, carrying stocks and tape measures in his head, and dressed in faultless fashion, to delve into the sooty, greasy depths of fire-room or engine space for instruction or pleasure, is expecting that oil and water should mix. In some cases it is, in others it is not. There are those who own large sailing yachts, yet know nothing and care less about their rig and navigation. But there are likewise industrious Corinthians and persons of ambition who seek to master the intricacies of working a vessel to the best of their abilities

and opportunities, nor are they frightened at the idea of work or the tar and the shakings. It is within reason to suppose a similar class of earnest enthusiasts will be found who seek advancement in all there about them, and who in time will as learnedly discuss "lap and lead," "cut-offs and expansions," "high and low pressure," "crank and disc motion" as we now hear bold Corinthians taking issue upon "luffing out or squaring away," "keels or boards," "cutter rigs or sloops," and the knotty formulas of "time allowance."

With steam all around us, steam whirling us up and down town, from floor to attic, from city to country town, steam in the kitchen turning the spit, steam in the sewing room whirling the sewing machine needle, and steam twirling the peanut roaster in the street, it would be strange indeed were gentlemen of leisure and means to pass by slightly the universal agency which has contributed so much to life's ease and comfort, and perhaps been the means of their own professional success. We need but look to older nations for an answer. There are in British waters vast fleets of yachts, from the yawl and launch up to stately sea-going vessels, driven by steam applied to screw or paddle. Among the owners of such yachts the number who comprehend and control the working of the machinery is growing apace, and a large class of amateur marine mechanics has sprung into existence.

Steam yachting and all that the term includes is not what many presume, a problem fully solved and in a quiescent *status quo*. There are the same issues in existence which animate circles devoted to the sail. Engines and boilers and systems and tools of propulsion of a rival kind there are innumerable. The question of model itself is perfectly unsettled. Type is still in the first throes of embryotic stages. Shall she be high speed, cruiser or auxiliary? Shall she be long, narrow and shoal? Shall she have a working rig or be content with poles, twin screws or single? And as for wheels and driving power, their theory and practice, their adaptability to various waters, these things of themselves open up a vast, and as yet unworked, mine for deep study and acquisition as well as for experiment and practice.

From America will ultimately hail the largest fleet of steam yachts in the world. The certainty of movement of such vessels recommends them to men pressed for time. Our vast network of rivers in the interior, the great distance to be traversed from point to point, all will insist upon the rapid multiplication of the small nucleus of steam yachts now afloat. For all this, there need be no fear that the sailing yacht will be driven to the wall. There is ample room in the world for both classes. Cheapness in first cost, economy in running and leave for a sailor's life will keep the fleet under canvas from extinction for all time. The man of steam will be drawn from other ranks, and with his vessel will add one more to the yachting way without a single sail being withdrawn on that account.

The recent formation in this city of a club, especially devoted to steam yachts, bears out what has been written above. It is the first step toward securing that recognition which has been denied by the self-engrossed community of amateur sailors through groundless fear of rivalry, and a failure to concede to steam yachts the importance they are entitled to.

#### SUPPORT THE TEAM.

NOW that the indignation, naturally felt at the action of the Rifle Association directors in the rejection from the team of one of the best shots in America, has in some measure subsided, the entire effort of all who wish well to American arms should be directed to strengthening the squad of National Guard-men who in a few weeks will set sail for the English range. The honor of the country has to be sustained by the men now giving their time and effort daily at Creedmoor to gain that thorough control of hand and eye which shall enable them success-fully to meet the English experts. The men are doing good work; they already show scores far beyond what was recorded a year ago at the same stage of preparation, and the prospect is that without any more than merely holding their own they will be able to make a strong fight with the picked British team.

The National Guard of the entire country owe it to themselves to see to it that the team of 1893 goes abroad in a manner befitting its representative character. The men on the team are not men of wealth. They are young men who love the innocent excitement of the rifle match, and having shown their ability to excel in one branch of the soldier's duty, it should be the proud and pleasant duty of every other member of their body to lend aid and assistance in getting them the victory. This can be done through a generous subscription to the fund now raising for the expenses of the team. These will necessarily be heavy, for a jaunt over the ocean for so large a group of men is not a trifling matter. Though it will be a short visit, it cannot be a lying one. After the novel experience of a sea trip, the men will need a few days for rest and quiet to steady their nerves and refresh their bodies. Then there will be some days' drill at Wimbledon to get acquainted with the ground over which the match is to be shot. During all the time the men look for their support to the body of their fellow citizens who will share in the honor which a victory will bring.

The board have placed their estimate of expenses at a

moderate figure. It is thought that \$6,000 will carry the team out and home again, and but a small percentage of this sum has already been secured. Every cent of it should be in the hands of the committee before the date of sailing. It will add much to the confidence with which the men will start if they know that their friends and well-wishers have been thoughtful in this respect. The men deserve support for the good work thus far, and as everybody feels like adding a trifle to a successful cause, they may feel assured that in all likelihood they will be doing so by sending a subscription to the American Team Fund.

#### BLACK BASS.

ON the first day of June the black bass season opens about New York. It is an open secret that to many it practically opens at Greenwood Lake on Decoration Day, two days before. This being a legal holiday, many persons go to the lake, and the people about it wink at the transgression, because the visitors leave substantial mementoes of their visit, which is regarded as a full equivalent. This practice is wrong and it should be stopped, or the law should be changed, making the opening of the season on the holiday. There is no doubt about the early season being the best. The fish seem livelier and even gamier than later in the greater heat of summer, with its greater excess of vegetation in the water. It is in the beginning of the season that the bass take the fly with more certainty than at any other time, and this alone is reason enough to many to make them anxious to go early to the lakes.

About New York there are not many good places for black bass. A few are taken in the Croton reservoir, but not enough to make it an object to fish for them, they are usually captured by those who are fishing for perch. The most accessible places for good fishing are: Greenwood Lake, lying partly in New York and partly in New Jersey, fifty miles distant from the city, and reached by the New York & Greenwood Lake R. R., with ferries at West Twenty-third and Chambers streets. This lake is one of the best black bass lakes in this part of the country, notwithstanding the great yearly drain upon it and the number of anglers that visit it. Several good hotels are on it, and the scenery is fine. Lake Hopatcong is reached by the Morris and Essex R. R., ferries at Barclay and Christopher streets, trains for the lake connecting at Drakesville, distance about sixty miles. This lake furnishes some black bass and many pickerel. It is quite a pretty lake and has hotels. From Hopatcong station passengers go some three miles by canal before entering the lake. Swartswood Lake, near Newton, N. J., sixty-seven miles from the city, is reached by the Sussex branch of the Del., Lac. & W. R. R., ferries foot of Barclay and Christopher streets. This lake also abounds with pickerel and perch and the fishing is often good. The rivers readily accessible from New York where the fishing is more or less good are: The Delaware from Port Jervis to within twenty-five miles of Philadelphia, and there are also black bass in the Raritan River.

Fly-fishing, where and when the fish will take the fly, is by far the highest of all fishing, but the black bass is a national fish, full of queer conceits about a diet of flies, or perhaps only regards them as dessert, to be taken in moderation, or not at all, according as his digestive organs may incline him. Certain it is that the black bass cannot be depended on to rise to the fly with anything like the certainty that we calculate on the rising of trout. Even trout refuse to rise at certain, or uncertain, times, but the black bass is always uncertain. For fly-fishing use trout tackle with larger and more gaudy flies, and allow the latter to sink and troll them after a cast. For casting or trolling the minnow, a shorter rod, about eight feet, of some stiffness, and a multiplying reel are used. Still-fishing from an anchored boat is done with rods of all kinds, but we prefer a trout rod if we are forced to practice this method by reason of the refusal of the bass to take the fly. Baits include frogs, helgramites or dobsons, worms, minnows, crawfish, grubs, grasshoppers, etc. Skittering a frog which, after being humanely killed, is hooked through the jaws, is good sport, and is done by standing in a boat while a man rows it slowly near the likely spots, and casting the frog on one side and jumping it along the surface two or three times and then casting it to the other side. This often raises large fish, and there is an amount of exercise attending it that lazy still-fishing does not bring. In doing this we prefer to stand in the bow of the boat, although most men take the stern. We prefer the bow because we then work water which has not been disturbed by the oars. Trolling with spoons or minnow gangs is a favorite with some. It requires no skill and is a murderous practice as well as a lazy one. If bait is used it will save much time, expense and disappointment to carry it, for it is often scarce at the fishing grounds.

Concerning the comparative gameness of the two species of black bass, we agree with Dr. Henshall, and, in defiance of popular opinion, claim as gamy qualities for the big-mouth as are possessed by his brother with the smaller opening in his countenance. The big-mouth, when under two pounds weight, makes a splendid fight, although he has been cried down, and it is fashionable to echo the cry. We look forward to the day when a fair judgment, irrespective of prejudice, will be rendered by intelligent anglers on this question of comparative gameness, always making allowances for the weight of fish. We believe that the proper fighting weight of a black bass is from a pound and a half to two pounds, if

he is in good condition, and that when he exceeds these weights his game qualities decline in proportion, and he is tired out in less time, always allowing light tackle to be used instead of hickory poles and main strength, which gives the smaller fish no chance to display his science and his pluck. Take the black bass all in all, they are the gamiest fish that the angler finds in fresh waters, except the brook trout, and there are anglers who do not except even them.

ENGLISH AND AMERICAN TROUT.—We would like a fair discussion as to the comparative merits of the English trout (*Salmo trutta*) and *Salvelinus fontinalis*. Those interested in the subject may read Mr. Chambers' remarks on American trout in our review of "Fish and Fisheries," in our fish-cultural columns.

## The Sportsman Tourist.

### THE WHISTLE OF THE ELK.

BY H. P. UFFORD.

JUST who was responsible for the position in which we found ourselves, was "one of them things no feller could find out." Ignotus charged it upon John, John shifted the burden to The Rhymer, while The Rhymer in turn laid it upon the shoulders of Ignotus. Whether that John was in hopes of discovering the mythical Dead Man's Gulch, where solid nuggets of pure gold as large as walnuts or as pippins lay "thick as autumn leaves in Vallambrosa" or that The Rhymer was fired with a wild desire to scale heights reputed to be hereto inaccessible to the white man's foot, or that Ignotus was led by the hope of finding and securing a specimen of that hunter's will o' the whisp, the mountain bison—certain it was, that the sun, descending behind Das Hemmies, seemed to wink derisively at our little party, as exhausted with the fatigues of mountain climbing, we huddled together for the night on a rocky shelf on the side of one of the steepest peaks of the steep group of the San Juan range, "the Needles." What there was in our surroundings to induce anyone to tempt the perils of the break-neck climb hither would have been hard to tell. Above and below, before and behind, on the right hand and on the left, a monotonous uniformity of stone was noted only by a uniform monotony of rock. Trachyte, syenite, or quartzite—black, brown or gray—cliff, talus, boulder or slide-rock—rent by the earthquake, pulverized by the thunder-bolt, or polished by the sliding avalanche, rusty with stain of iron, or ashen with the sickly gray of the lichen—everywhere it was rock, rock, rock, that met our view, crouched on the worn strata of the base of one jagged cliff, and facing across twenty yards of black chasm, another no less rent and torn—on the one side, the gorge above choked with jagged boulders, heaped together in elemental confusion; and on the other, the gorge below breaking off to the nether world by a Devil's Staircase of shattered porphyritic steps—our only bed the angular slide-rock, and our sole lullaby the shriek of the wind as it swept through the pass; still, Gallie, like "carrots for none of the things."

A new experimenter always pays for itself, even though its price be tears, and woe, and blood; and it was worth while once in a lifetime to see nature in her most savage mood. Stripped of all her virginal beauty and grace she stood revealed before us that night, cold, pitiless and cruel; a deon goddess whose breath was the hurricane, the glance of her eyes sharp thunderbolts, and in the touch of her bloodless hand the chill of death. Little recked we, however, we had laughed in her face ere now, and were not children of a younger world to grovel on our faces before her because she chose for once in a way to show us the virago side of her character. "Nature never did betray the heart that loved her," and we felt no fear of her, on whose lap we had so often laid our tired heads and been lulled to sleep, like weary children, by the crooning of her voice. So we knelt on the ashes out of our pipes, smoothed out a place among the rocks as best we could, wrapped our blankets around us and soon forgot our pains and aches in the gentle caresses of sleep.

Next morning, after a breakfast of dry bread and jerked beef, we swung to the left, flanking the cliff under which we had slept, and after nearly four hours of weary climbing, entered upon a meadow of upland meadow, thickly set with clumps of spruce and alder and watered by a little stream, which, taking its rise in the peaks to our left, poured its waters into the gulch up which we had struggled the day before. Deer signs were plenty, and while following one of the freshest of the trails, intent on fresh meat for dinner, The Rhymer suddenly stopped, as though petrified.

"Why, here are the tracks of a drove of steers—three-year olds at least."

"Pshaw! you're crazy! No steer in the world could climb up here."

"Cattle? What do you mean?"

"Why, here are the tracks of a drove of steers—three-year olds at least."

"Pshaw! you're crazy! No steer in the world could climb up here."

"Cattle? What do you mean?"

"Why, here are the tracks of a drove of steers—three-year olds at least."

"Pshaw! you're crazy! No steer in the world could climb up here."

"Cattle? What do you mean?"

"Why, here are the tracks of a drove of steers—three-year olds at least."

"Pshaw! you're crazy! No steer in the world could climb up here."

"Cattle? What do you mean?"

"Why, here are the tracks of a drove of steers—three-year olds at least."

"Pshaw! you're crazy! No steer in the world could climb up here."

"Cattle? What do you mean?"

Now, tobacco smoke they don't mind a bit, while a black-lait hates it like pizen."

The rest of the day was spent in studying the lay of the land, and in planning the morrow's campaign. It was decided that Ignotus and The Ryhmer should essay the capture, while John would "keep camp" in their absence, as the exertions of the last two days, joined to the exposure of the night before, had brought him a visit from his old friend, "the mountain goat."

The moon was up fairly above the horizon when the pair stole carefully from their blankets and started for the peaks, looming dimly in the distance. The morning was phenomenal—neither clear nor cloudy, light nor dark. There was no perceptible mist, yet all things had a hazy, uncertain look. The shadows cast by the trees were as clear and pitchy-black as though produced by the electric arc, yet the moon shone but pale and wan. There was no sign of hoar-frost on the grass, yet the stinging air felt damp and raw. The stars glittered like sparks of fire, yet the sky was sodden and gray. Everything was incongruous and contradictory, as though Chaos was just departing, and the New Earth had not yet been born.

As the hunters threaded their way silently through the alder groves, or crossed the mesa from one woody island to another, they seemed to themselves like shades of the departed, flitting around the place which had been their accustomed haunt for many a day. The world was all wrong, but neither felt bold enough to break the uncanny stillness. The sense of something mysterious, of a vague intangible "one-knows-not-what," a feeling that "it is the unexpected which always happens," seemed to weigh down and oppress them. Weak ghosts of sounds quivered around them, yet if one turned to listen, they ceased, and nothing was heard but silence; the silence of the Cosmos, which, maddened at its own dumbness, flung itself upon the ear with a muffled, pulsating roar, wherein were mingled the plunge of the surf upon the shore, the moan of the wind in the bending tree-tops, and the low reverberation of the drying thunder-pearl. Ghosts of things there seemed to be, as well as ghosts of sounds; spectral forms vanished behind the somber spruce boles; white wraiths floated over the mesa, fading away as soon as looked at; intangible somethings which eluded sight, and dimly shadowed the flitted before, and behind, and on every side of them, plainly felt, though all unseen; so that it was with a sigh of relief that they finally reached the throat of the mesa, where it narrowed to enter the peaks, forming a *cul-de-sac* through which the hunter instinct of Ignotus told him the elk would most likely pass on their way to the pasture before. But, led by their suspicious nature, they might vary their usual routine, and cross over the "rookie mountain" or "saw-pipe-back," which formed one side of the throat, so The Ryhmer was left there that he might have a double chance, while Ignotus went further up, following a trail so broad that it might have been a cow-path or a New England hillside.

Cuddling down between two boulders, with his back to the cliff, yet so situated that he could watch both the pass above and the rounded sheep-back before him. The Ryhmer proceeded to make himself comfortable while he kept the "big water" in his dead-end. There was still a sense of preparation—an expectation of something about to happen, but something wonderful, and not terrible; majestic, but not awful. Nature was preparing herself for the working of a miracle—the less marvellous because it is repeated over and over again—the miracle of the birth of a new day.

Struck by the marvel, Jupiter passed for a moment on top of Dos Hermanos, and Orion shifting his hand from his sword-hilt, shaded his eyes to see what was to take place on his sister, Terra. But infinity cannot stand still, and they wheeled onward again in their planetary march, while a thrill of vague unrest stirred the bosom of the earth-goddess, as she waited for the first kiss of her coming lover, the Sun.

And then, from the sky above, from the air around, from the river (rump) of some distant star, from every crevice and from nowhere, comes a low, distant, plaintive note, rising, swelling, falling, echoing from rock to crag, and dying away in the pass below.

"O hark! O hark! how shrill and clear,  
And shriller, clearer, further going:  
How faint and far, from cliff and scar,  
The horns of Ethna faintly blowing."

Nature bends her ear to listen, as it comes again, like the long drawn strain of an Æolian harp, or the first doubtful note blown by the great God Pan from the reed he cut by the river. Once, twice, thrice it comes, borne on pulsating ether waves, echoing, echoing from cliff to cliff, note and echo so blended that the ear cannot separate the one from the other. In its evanescent strain are suggestions of all supernatural music heard since the world began; the glad cry that broke from the lips of Memnon's statue when touched by the first sun-rays; the cry of the desert, the cry of the wild, heart-broken wail that went shuddering through the vineyards and olive groves of the Mediterranean isles, announcing to a heathen world that the old pagan gods were dead, and the new Christ was come; the angelic sadness of that seraph strain that held the sin-worn Lancelot mute, as, before his raptured sight, slow swam the Holy Grail; or the wild, defiant outburst of Scandinavians, Thor, challenging the new faith to battle, while King Olaf still went sailing, sailing up through Drontheim Fjord.

With half closed eyes and parted lips, The Ryhmer holds his breath to listen. When the last sweet echo has died away, he comes back to earth again, opens his eyes, and lo! on the crest of the rounded hill opposite him, outlined upon the sky and thrown into high relief by the faint pink glow behind, he sees, through the gray haze of the morning, the long adumbration of a mighty head, crowned by branching antlers, an arrow's flight from its tip.

Silently and spectrally, while he gazes, another giant head takes shape and form out of the curling mist, and another, and another, each materializing slowly and each more life-like than its predecessor, till the whole background of the sky is crossed and recrossed by the huge palmate horns, beneath which a vivid fancy almost distinguishes shapeless bulks which might pass for the bodies of giants, whose giant heads belong here. Here, he thinks, is a capital illustration of the way in which so many ghost stories take their rise.

Given a fantastic imagination prone to play tricks upon its more matter-of-fact brother, Common Sense, and surroundings a little out of the commonplace beat of every-day life, and what more natural than that the subjective should dominate over, or even usurp the throne of, the objective, and the afferent ideational be merged into the efferent sensational? By one who has not, like himself, been accustomed to the practice of cool, methodic analysis, and has thus learned to recognize intuitively the line which separates illusion from fact, these ghostly shapes would be taken for real, instead of, as they truly are, mere phantasms of the brain, projected upon a background of fog and sky. In fact, the method of their appearance is proof of their unreal character. If they were solid flesh and blood, the tips of the horns would first be seen rising gradually over the crest of the hill, till the whole head came into view, as the white top of a ship appears over the curve of the sea, or the vessel herself swims into the watcher's ken. Instead of which the whole head comes into view at once; just as a dim, shadowy outline, then gathering form and shape as the actinic rays of fancy impinge upon the sensitive plate of the mental camera. As The Ryhmer dreamily contemplates these eldora of the mind, and lazily smiles to think how a less keen psychologist than he might be duped by these airy visions, a long lance of light from the rising sun flitted flashes over his head, breaks upon the slope opposite, the gray mist vanishes as by magic, and—by the spear of Nimrod! what he has taken for the idle stuff of dreams proves to be the veritable drove of elk for whose coming he has been waiting! Motionless they stand, within fair rifle shot—twenty-three or thereabouts, the largest drove of bull elk he had ever, or for that matter, has ever seen. All noble, majestic beasts, too; not a runt or an ignoble head among them. So snugly they look, so free and wild, and in such perfect keeping with the scene, that for a moment there flashed through The Ryhmer's head the insane idea of letting them go scot free; but the next moment the hunter's instinct of slaughter, or, it may be, the ganglionic nerve centers of the stomach, prevails, and the Sharps .44 rises slowly to the shoulder, steadies a moment, there is a pressure upon the trigger, a tongue of flame, followed by smoke, leaps out, the silence of the dawn is shattered by a detonation of sound which clashes and clangs from cliff to cliff, there is a rush of feet, forms, and a clatter of hoofs, and when the smoke has drifted away down the pass, the opposite slope is as devoid of life as when it first met The Ryhmer's eye two hours before. As devoid of life, but its smooth outline is now broken by a shapeless russet bulk, and a thin red stream is slowly staining the brown shingle and scattered clumps of moss. Death must have been instantaneous, for the elk is simply sunk upon its knees, and except that the head has fallen to one side, so that the antlers touch the ground, he looks as though he might be quietly sleeping. With human inconsistency The Ryhmer, who would have heartily cursed his luck had he missed his aim, feels a sensation of half regret because he did not. In a few moments, Ignotus having heard the shot, appears, picking his way down the pass, and in five minutes more he and The Ryhmer are busily at work "gralloching" their quarry.

"I heard 'em whistle," says Ignotus, holding his bloody knife between his teeth, while both hands tug at the tough hide, "and I knew from the direction they weren't coming my way, so I thought you'd be apt to get 'em. Rather early for 'em to be running, though; last year's calves are hardly weaned."

"Heard 'em whistle!" then the wild music which had filled The Ryhmer's mind was rather, but the enormous call of a four-legged beast to his hairy loins.

To this day Ignotus has not found out why The Ryhmer, after gazing at him for a moment with a look of blank disgust, softly murmured, "Oh! that one were here to write me down an ass!"

## Natural History.

### BIRDS OF NORTHERN OHIO.

#### ADDITIONS.

CLEVELAND, O., May 31, 1883.

*Editor Forest and Stream.*—Having collected birds in this locality for about twenty years, I feel called upon to offer some comments on the list of "Birds of Northern Ohio" from my friend Mr. Ingersoll, which appeared in last FOREST AND STREAM, as well as to make a number of additions to his list.

Golden-crowned Kinglet—*Regulus satrapa*.—Very seldom visits us in winter, but is a common spring and fall migrant.

Red-bellied Nuthatch—*Sitta canadensis*.—I have never seen it in winter, but it nearly always visits us in spring and fall, and at times in great abundance.

Brown Creeper—*Certhia familiaris*.—Is not a common resident, but in spring and fall and mild winters it is abundant.

Worm-eating Warbler—*H. coronatus*.—Rare migrant. I think less than a dozen have been procured from this locality.

Orange-crowned Warbler—*H. aberti*.—Not rare during fall migration.

Kirtland Warbler—*D. kirtlandi*.—There are now eleven specimens recorded, six of which were taken within five miles of Cleveland, and two of which I shot.

Snow Bunting—*P. nivalis*.—An abundant winter visitant.

Hairy Woodpecker—*P. villosus*.—Common resident.

I will now add to the list:

Gray-checked Thrush—*Turdus carolinensis*, var. *alio*.—Not uncommon migrant.

Great Carolina Wren—*Thryothorus ludovicianus*.—Rare summer resident.

Prothonotary Warbler—*Protonotaria citrea*.—I know of but one instance of its capture here.

Tennessee Warbler—*Helminthophaga peregrina*.—Rare migrant.

White-browed Yellow-throated Warbler—*Dendroica dominica*, var. *albifrons*.—Not uncommon on river bottoms, especially among the cypress swamps.

Water Thrush—*Sturna marina*.—Not uncommon migrant.

Connecticut Warbler—*Oporornis agilis*.—For the last two or three seasons I have found this warbler in considerable numbers for a "rare" one, having taken from six to twelve each year.

Lincoln's Finch—*Melospiza lincolni*.—Irregular spring and fall migrant.

Snowbird—*Junco hyemalis*.—Abundant in colder months.

Black-throated Bunting—*Pipilo americanus*.—Summer

resident; seemingly rare some seasons, and sometimes abundant.

Yellow-bellied Flycatcher—*Empidonax flaviventris*.—Rare migrant.

Great Horned Owl—*Bubo virginianus*.—Common resident.

Goshawk—*Accipiter velox*.—Rare winter visitor.

Rowl-legged Hawk—*Archibuteo lagopus*.—Not uncommon during colder months.

Golden Eagle—*Haliaeetus hyemalis*.—Rare.

Wild Turkey—*Meleagris gallopavo*, var. *americanus*.—Formerly abundant here, but now extinct, except in heavily wooded counties.

Avocet—*Recurvirostra americana*.—Rare; have never seen but two specimens, both from vicinity of Sandusky Bay.

Stilt—*Himantopus nigripennis*.—Rare.

Northern Phalarope—*Lophopus hyperboreus*.—Rare migrant.

Pomarine Jaeger—*Phalacrocorax borealis*.—Rare migrant.

Red-breasted Snipe—*Macrophopus griseus*.—Rare.

White-rumped Sandpiper—*Tringa fucalis*.—Rare migrant.

Red-breasted Sandpiper—*Tringa erythraea*.—Rare migrant.

Willet—*Totanus scutulatus*.—Rare migrant.

Solitary Sandpiper—*Totanus solitarius*.—Common summer resident.

Bartramian Sandpiper, Upland Plover—*Actitis hypoleucos*.—Common summer resident.

Wood Duck—*Tadorna borealis*.—I know of but a single specimen from this locality.

Night Heron—*Nycticorax nycticorax*.—Rare summer resident.

Whistling Swan—*Cygnus americanus*.—Not uncommon migrant.

Blue Goose—*Anser carolinensis*.—Rare.

Barrow's Goose—*Branta cirquensis*, var. *hutchinsii*.—Rare; given on authority of R. K. Winslow.

Gadwall—*Chirolophis streperus*.—Not common migrant.

Greater Blackhead—*Fuligula marila*.—Not common migrant.

Golden-eye—*Bucephala clangula*.—Spring and fall migrant; have seen them in cracks in ice on lake in mid-winter.

Long-tailed Duck—*Harporhynchus glacialis*.—Not rare during cold months; abundant at lower end of Lake Erie.

American Black Scoter—*Glaucous alpestris*.—Rare winter visitor.

Violet Scoter—*Glaucous alpestris*.—Rare; have only seen them in fall and winter.

Ruddy Duck—*Eristalis rubra*.—Not uncommon migrant.

Red-breasted Merganser—*Mergus serrator*.—Rare migrant.

White Pelican—*Pelecanus erythrorhynchos*.—Rare migrant.

Hutton's Vulture—*Neophallus pennsylvanicus*.—Very rare; I know of but two specimens secured here, both of which are in my collection.

White-winged Gull—*Larus leucopterus*.—Rare winter visitor. Given on authority of R. K. Winslow.

Kittiwake Gull—*Larus tridactylus*.—Very rare visitant. Given on above authority; have never seen a specimen.

Black-throated Diver—*Colymbus arcticus*.—Accidental visitor; have only seen one specimen, which was shot on Sandusky Bay.

These additions to the list published, are made from actual capture or possession of species mentioned, with four (4) exceptions, of which three are given above on authority of R. K. Winslow, and prothonotary warbler, which Dr. J. P. Kirtland showed me, giving locality of its capture, etc.

The list, as amended, is practically complete.

H. E. CHUBB.

### "NEW ENGLAND BIRD LIFE."

#### VOLUME II.\*

IT has become rather the fashion of late years in this country to publish works on ornithology in an incomplete form. The appearance of the first part or volume of some admirable work would excite high hopes in the minds of those interested in the subject, but time would pass on, and the desire to behold the completed work remain unsatisfied. We can think at this moment of half a dozen works which are known only by their fragments. The most glaring instance of the kind is the case of Baird, Brown and Ridgway's "North American Birds," of which we know only the land birds, but there are not wanting others in which the disappointment has been almost equally great. It is very gratifying, therefore, to be able to announce the completion of "New England Bird Life," the first volume of which was noticed in these columns (FOREST AND STREAM, Vol. xvii., p. 267, Nov. 3, 1881) soon after its appearance. At that time we expressed our views on the value of the work and its usefulness to the public, and in the concluding part showed that it is no less important than its predecessor. Indeed, in some respects it is much more so, for it treats in part of the water birds, a group—if we may use that term—which for many years has been sadly neglected. For, with the exception of what is said of them in the "Birds of the Northwest," nothing systematic has been written on this important division of our birds since the days of Audubon.

To treat the birds of New England from the "Pyramide down to the end of the list in a single volume of 400 pages is a task that few men, either as authors or editors, would care to undertake, but Dr. Coues has succeeded marvelously well in giving the important facts with regard to each species. As may be imagined, there is no expansion of the biographical notes. Each bird is treated with the utmost conciseness, and yet the references, which enable the reader to look the subject up for himself, are never omitted. Notwithstanding this conciseness, one would know, even if Dr. Coues's name did not appear on the title page, that he had a hand in the authorship of the work, for it abounds in those happy turns of expression and telling phrases for which he is so justly renowned. It is therefore a delightful reading, and judged from a scientific standpoint, it is as excellent as we should expect a work of Dr. Coues to be. The importance of having put together in compact shape so that they can be readily got at the scattered notes and records, which during the past years have been gathered by the large and ever-increasing number of those who are accustomed to much turning over of books in their search for such records and notes, will appreciate what has been done for them in this respect by Dr. Coues and Mr. Stearns. It would be an agreeable task, did our

\* New England Bird Life (Being a Manual) of New England Ornithology, revised and edited from the manuscript of (Winifred A. Stearns) by (Dr. J. A. Allen), and published by (Dr. J. A. Allen) (By Elliott Coues) Member of the Academy, etc., Part II. Non-migratory Passerines Birds of prey Game and Water birds Boston Lee & Shepard, Publishers New York, Charles T. Dillingham 1883.

space permit it, to notice in detail the contents of the present volume, but we must content ourselves with referring the omniscient reader to its pages, assuring him that he will find each one of them full of interest.

### HABITS OF THE PANTHER.

I WAS much interested, as I presume many others were also, in the carefully written, and, as I believe, generally accurate account of the cougar, or panther (*Panthera concolor*) by Mr. Livingston Stone, in one of the recent numbers of the *Forest and Stream*. My former opinion regarding this rare and formidable animal is usually read with avidity by those at all interested in the fast disappearing denizens of our forests and mountains. I am tempted to add a few items of my own observation upon the habits and characteristics of this great cat, more especially as my experience in one or two minor points differs somewhat from the conclusions of Mr. Stone.

Seldom found very abundantly in any portion of our country, when compared with other wild animals of equal size, and still more rarely killed, unless by poison, the panther is nevertheless usually the first animal who disappears before the advance of civilization. They are extinct in most localities long before the deer or bears have suffered any serious diminution in numbers. Upon many portions of this coast, however, panthers are still frequently met with. It has always been a perplexing matter to my mind why the pioneers, many of whom were well acquainted with the animal as found in the Eastern forests, and knowing it there as the cougar or panther, should have straightaway set about calling the same animal which they found here the California or mountain lion. Certainly in appearance the two panthers are so nearly alike that no one would dream, upon comparing them, of regarding them as distinct species.

As to their habits, my ignorance in those of the Eastern animal prevents me from comparing them in that particular. Only upon one point I can speak, and on that so far as my knowledge extends, and also from the assertions of many old hunters and trappers who were perfectly familiar with them. The panther of the West coast never indulges, for his own entertainment, in those eerie screams with which his Eastern brother occasionally makes the night hideous when hungry or lonely. I have heard their savage yell as far west as the Baton Mountains on the Santa Fe trail, but although I have hunted and camped for weeks and months at a time all through the Sierra Nevada coast and Cascade ranges, from Washington Territory and Oregon in the north to the Mexican line of San Diego in the south, in many parts of which the panthers were so abundant that their fresh tracks could be seen every day, I have always listened in vain there for their characteristic cry.

The more I learned of them in their native haunts the more skeptical I became in regard to their ever willingly attacking a man. I have known them on several occasions to follow persons a short distance, and I have seen wolves do the same thing, especially when I have been picking in freshly killed meat, but I do not believe that in either case they meditated an attack. In one instance, in the Cascades near the Hood, I knew a panther to jump at a man as he lay at night in his blankets, but as soon as the man partly arose and shouted for assistance the animal bounded into the brush and disappeared. In talking it over we all came to the conclusion that the panther had seen the man move under his blankets and had mistaken him for some less formidable antagonist, and that when the deception was revealed to him he threw up the job at once. As for those stories we read occasionally about their chasing a man on horseback for several miles, in which the writer assures his readers that he only escaped being devoured by being providentially mounted upon the fastest horse in all that section of the country, they appear so absurd to all hunters acquainted with the animal in question that they are looked upon at once as extracts from "Dashing Dick of the Wild West," in the dime novel series.

That the panther will run from and tree before the smallest yelping cur that can be induced to follow his trail is true, but I am satisfied that instinct in some mysterious manner warns them of the hunter behind the dog, and that it is the latter only which they hold in fear. This I have demonstrated to my own satisfaction, and have had it corroborated also by others. Upon one occasion I followed a panther that was being chased by a settler's dog in the dense hemlock and spruce forest through which the Cascadian River, in Oregon, runs, and although the plucky little cur treed him at least a dozen times, I did not succeed in obtaining the slightest glimpse of the brute, and after chasing him from early dawn until late in the afternoon through the most terrible wilderness of almost impenetrable thickets, immense fallen trees and giant ferns, I found myself so completely tired up that I was forced to relinquish the pursuit from sheer fatigue.

In this instance the panther must have paid but little attention to the dog after he treed, but put in the time listening for my approach, and as soon as that was ascertained he would jump at once to the ground, continue his flight for perhaps half a mile or more, when he would again take to a tree and the same thing would be repeated. On two other occasions, where the ground was particularly favorable, I got near enough to hear him as he left the tree, which he seemed to do just as readily as if there had been no dog there.

In regard to their manner of climbing, they ascend the immense trees near the mouth of the Columbia, which are frequently 300 feet high, and 60, 80 or even 100 feet to the first limb, precisely as a cat would climb them, and when wounded, will usually go to the top of a tree, and there I found in a small glade in the forest, where from the sign it was evident that two or more of them had been gamboling and like kittens scurrying around in the grass, and then bounding against the trunk of a tree, at a point at least ten feet from the ground they had ascended apparently on the run, tearing off great pieces of bark, and leaving claw marks a foot long on each side.

Although they are in some localities spend the day in lying upon the limb of a tree, I think they always prefer rocky ledges and caverns for that purpose, where such are accessible. In San Diego, near the Arizona line, the rugged, rocky ranges furnish admirable retreats for panthers, there usually called mountain lions; and although not so abundant, that are, I think, more frequently shot than they are further north, for reasons that will soon be explained. Like all of the cat family, they are very fond of warm, and especially when it is rather cool in the shade, they frequently come out of their lairs in the middle of the day and lie upon the rocks near by to bask and drowse in the warm sun, and as the ranges there are generally very sparsely timbered, they are occasionally discovered by hunters, when the

chances of getting within shot are better than under almost any other circumstances. But for all that, they are animals that are seldom shot, nor much hoarded, and they may be, and their disappearing so rapidly before the march of civilization is a mystery that I can only solve by the conclusion that, being such a large and entirely carnivorous animal, they are immediately affected by the least thinning out of the large game, and are driven by hunger to seek places where the rifle has not begun its deadly work, unless, as they seem to have done on the McCloud River, they turn their attention to the stock of the farmer.

Many of them are poisoned by the sheep and cattle men of the southern counties when their visits to the flocks or herds become too frequent, and I have often seen their hides nailed to the walls of the lonely cabins of the stockmen there, and, upon inquiry, were found to have been poisoned in at least three cases out of four.

I entirely agree with Mr. Stone in the belief that a panther would be no match for a grizzly. It is quite possible that their superior agility might sometimes make them more than a match for a black bear, but I can only conceive of their being able to kill a grizzly by fastening upon him in a position where the bear was unable to inflict any injury upon them, as a single, well-directed blow from the paw of a full-grown grizzly will crush in the ribs of an ox, and would, I fancy, leave but little light in any panther.

With a single incident to illustrate the idea that it is the hunter and not the dog the panther fears, I will close this already lengthy article. In the summer of 1868 I was in Port Gamble, on Puget Sound. A trail leading to Port Madison, eight or ten miles distant, was the only land route open in any direction, and that ran through an unbroken forest the entire distance. One of the workmen at the saw mill at Gamble was returning along the trail from Madison one afternoon, having with him a favorite little dog, who was trotting along a few yards in advance, when a panther bounded suddenly from the brush, and, snatching up the dog, disappeared with the quickness of thought on the other side of the way. The man stated that it was so quickly done that he seemed to take the dog without stopping in a flying leap across the trail.

SAN FRANCISCO, May 15.

CARDINAL GROSBEEK IN LOCKPORT, N. Y.—While collecting specimens last Saturday, my son shot a male cardinal grosbeak and female rose-breasted grosbeak. There is no doubt that the cardinal was a wild bird, as it showed no signs of being caged. This is the first I have known to have been taken so far north, and which it is a rare occurrence.—J. L. D. (Lockport, May 17, 1883.)

FLORIDA GALLINULE IN NIAGARA COUNTY.—On May 8 my son received a Florida gallinule to be mounted which was shot at Wilson, on Lake Ontario. Is it not unusual for this species to be found so far north and inland?—J. L. D. (Lockport, May 17.) [The Florida gallinule frequently breeds in Central New York. See *FOREST AND STREAM*, Vol. vi., p. 52, and elsewhere.]

A BLACK EAGLE.—(Richmond, Va., May 24.—On the 19th inst. there was shot at Dutch Gap, this State, a splendid specimen of the black eagle, measuring six feet from tip of wing and three feet from beak to tip of tail. It has been preserved and mounted by W. E. Pusey, a taxidermist of this city.—J. H. T.

### Camp Fire Flickerings.

"That reminds me."

"THAT reminds me" of how Mac shot ducks on a little pond a few miles back of Nyack last fall. Mac and a friend had just got down into the pond when they saw a flock of some five or six ducks sitting in the bushes a short distance away. They appeared to have taken no notice of their boat. It did not take these mighty hunters long to lay their plans for the battle, which were to fire two barrels on the "sit" and two when they arose. They both fired, but no ducks flew up, but there was a great amount of splashing. Of course they thought they had knocked the whole flock out and they commenced to shoot the cripples. Just as they had picked up their first two they were startled by loud cries from the bank, and on looking up saw the vision of a six-foot German woman, who was running about the bank crying out excitedly about her duck. But here we must draw the curtain, for mere shame sake, and I need only add that they paid a dollar or two and did not get the ducks either. Mac has not shot much since that trip.

NIAGARA.

Here is a story of the Newfoundland seal fishery which illustrates the "luck" of the business. There are many steamships engaged in the business off the Newfoundland coast. They engage the fishermen to work on shares. The fisherman is to get one seal out of every three captured. This looks to be a fine thing for the fisherman, but it is not. The fisherman is charged storage for his seal, he has to pay a share for the boat he uses, for in many cases the fishermen are poor and cannot provide their own "kit." Then he has to pay four or five pounds for the loan of a gun. There is still another way in which money is made out of the fisherman. He has to pay ten cents for every shot-hole he makes in the pelt when killing the seal. There is a good story told about this charge for holes. A fisherman one day shot a seal, making twelve shot-holes in his pelt. He took the skin to the company, and was told that it was worth \$1.10. When he came to settle up he found that he had been charged \$1.20 for the holes in the skin, and that he was indebted to the company to the extent of ten cents by the transaction.

H. S. S.

I met Richard Roe the other day and asked him if he had had any snipe shooting this spring. "Oh, yes, all I wanted, but if there is any bird I can't hit it's a snipe. Had all the shooting I wanted though. There was one snipe out our way and I have hunted him all spring, until some damned fool came along the other day and killed him."

CLEVELAND, Ohio.

Ward had been hunting for nearly two hours, but without success. His old muzzle loader would not go off. After snapping about twenty cups he saw water in the tube and soon drew out a large tobacco quid.

W. K. P.

ATHENS, Pa., May 24.

### Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of *FOREST AND STREAM*. Will not our correspondents favor us with such advice?

### AN ADIRONDACK EVENING.

THE deer was walking along in the sand. Now he stopped and lifted his head into the air, now walked on again. Noiselessly the canoe ran toward him. I could not tell that it was moving, nor could I hear the least sound from the paddles, which sunk deep into the water, was passing quickly to and fro. I well knew the skill of him that held it, and that on me alone depended our success.

Nearer and nearer we glided. The deer had not seen us yet. It was dusk. The last hues of the sunset were fading in the west, and darkness was fast settling over the lake. The boat was not yet plain from the shore, but I could clearly see the outline of the deer. He stopped and raised his head again. He saw the canoe now. Instantly he watched us. Still nearer we went. He did not move yet. A few rods more. He jumped back. It was a broadside, I raised the rifle and pulled. He staggered an instant, then plunged into the woods. I sank the canoe flying toward the spot. There were the footprints where he had jumped, sank deep into the sand; and there was something else—yes, more on a fallen tree. A little farther, and there the deer lay dead, with a bullet through his side.

"By Jove, Hank, look at those horns."

"Yes, Professor, he's a big 'un."

It was quite dark when we reached the pines. There was no time to build a hut, but the night did fair to be a clear one; so after dressing and hanging up the buck we went, just as it rested when Columbus discovered a new basin of clear, sparkling water, glittering sand, and a bottom, bright moss hanging thickly upon its sides, and a little stream flowing to the lake. The water was cold and delicious. The soil through which it rose impregnated it with mineral properties. This was our beverage; the flesh of the deer our food. When we rolled ourselves in our blankets at the foot of a lofty pine we were in no mood to sleep. We had killed and then they threw upon the fire, till the sparks rose high among the trees, then taking a blazing brand, I set fire to an old dead trunk that stood alone upon the point. It had been a lofty pine once, but the lightning had shattered it, the wind had wrested away its branches one by one, and the old trunk had been left standing there to be the camp-fire of two hunters, and a royal camp-fire it was, flames rising high above the trees, and the sparks flying out over the lake whose surface was lighted far and long after Hank had fallen into slumber I lay there in reverie. The sky was clear and studded with stars. Here and there, through the openwork canopy of pines, I could see them.

How silent and peaceful the lake was as it rested there in the bosom of the wilderness just as it rested centuries before, just as it rested when Columbus discovered a new world.

It looked to me as it looked to the Hurons years ago, as it would have looked to Hendrick Hudson had he penetrated to its solitude, or to Burgoyne when his army was marching to its grave near by. Might it not have been the same when Troy fell? When Romulus laid low the walls of Rome? When Caesar was murdered? When Paul preached at Corinth?

This I mused as I gazed, out upon the beautiful sheet of water, illumined with weird distinctness by the burning pine. I imagined it a lake of old Thessaly or Greek Arcadia; the woods and streams around the haunts of satyrs and nymphs, and the noble Raquette near by the home of some old river god. Diana might have hunted here and bathed in its secluded waters. I fancied I saw Dryades come out of their lairs and glide away sleekly and gracefully, followed by the hoarse laughter of the satyrs, and then, out of a little crystal spring, rose a nymph of fairy grace who danced away over the mosses.

There appeared to me to be a new beauty in that old mythology of the ancient world, that idolatry which peopled every mountain top, every winding stream and crystal fount, every forest glen and every cavern discovered a new world. I marvel that the beautiful imagery and noble humanities were so deeply rooted in the Grecian heart. It was the worship of God in nature—a worship instinctive to man. That old form of it has long since passed away. I stood in imagination upon the Athenian Acropolis, and saw the ruins of the Parthenon. In the calm beauty of the Grecian night, the moon poured a flood of golden light over the broken columns, and the marble statues of the pedimental statues seemed, like the dull, cold lips to speak, and all to say: "Great Jupiter is dead!"

I gazed out upon the mountain lake again, and there, in the deep silence of the Adirondack night, the water, the trees, the hills, aye, the stars far above, spoke to me and said, "Jehovah endureth forever."

### A QUEBEC HUNTING GROUND.

THAT part of the Laurentian range in the Province of Quebec, which is situated directly north of the ancient city of Three Rivers, is one of great interest to the sportsman. There are several lines of communication; one by the railway from Three Rivers to the lake, and another by others by driving directly in a barouche from Louiseville, Yamachiche or Pointe du Lac, which places can be reached from Montreal in three hours by the North Shore Railway, or by driving direct from Three Rivers, passing by the St. Maurice Forges. This latter place enjoys the distinction of being the first place in Canada where iron ore was smelted, this having occurred in 1787.

This is the trifolium district is very interesting to the student of geology—many traces of the glacial period are to be seen. The roads are excellent, except in the immediate vicinity of the villages above mentioned, where the clayey nature of the soil causes them to be somewhat heavy in wet weather. A drive of twenty-five miles brings the sportsman to the base of the Laurentides, and in close proximity to the lakes. Here the barouche is abandoned, and the canoe and the walking.

The lakes are innumerable and are swarming with trout; others are filled with bass, masselonge, pickerel, etc., many of the lakes have never been fished at all, and brook trout are caught weighing six pounds, while the "lakers" or lake trout attain a weight of twenty. For about three weeks in

built to my order. I found upon trial that I could do better shooting with other brands and felt it to be my privilege to use them. I am now using a 500 Winchester, and, notwithstanding the company's advice and the Major's "insistence," I expect it to be my privilege to use such ammunition as I find gives me best results. The fact that our hunter-people admit the use of ammunition that can be prepared by most people who use them is one of the strong points in their favor.

I have enjoyed good opportunities to observe and compare the work of muzzle and breechloaders on game, and as "a specimen brick" would briefly state the results of two trips after deer by parties from this section. During the first trip five of our party used muzzle-loaders and three used breechloaders. During the second trip four of our party used muzzle-loaders and four used breechloaders. Time of each trip about three weeks. I think the aggregate of skill on the side of those displaying the muzzle-loaders was at least equal to that on the other side. For every deer killed by a muzzle-loader during these trips, five were killed by the breechloaders. I killed with a breech-loader during these trips, too, deer, five of these fell dead, two were wounded, and three were missed at the first fire. Of the latter four would have escaped had I been using a muzzle-loader.

It cannot be claimed that the failure of the muzzle-loaders on these occasions was owing to lack of opportunity. I had a vivid recollection of the outcome displayed by a member of our party after he had sat behind some rocks and snatched a number of caps upon a fine muzzle-loader that refused to go, with four deer in full view peacefully chewing their cud within six rods of him.

Had Maj. Merrill been a member of courtesy and had he attempted to champion the muzzle-loader against our camp life the evening after this fiasco, he would certainly have exposed himself to the danger of being "blown up" by the most dangerous sort of an "explosive." The close of our hunt furnished the opportunity for those wishing to secure first-class muzzle-loaders at a bargain. But my intention was to propose a match only. I am quite anxious to bring this about and will agree to use factory ammunition if there is any hitch upon that point.

GASSEVOYER, May 21.

## Sea and River Fishing.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will our correspondents favor us with notes of desirable points for angling excursions?

### AN ANGLER'S STORY.

IN MEMORIAM LORENZO PRIST.

"After I'll rifle her sleep well."

SWEET spring has come to the back-side.

And to the mountain meadow.

Scattered her favors far and wide;

Attuned her voices clear:

But a voi in all there seems—

As we wander, roe in hand,

We miss the ever kindly gleams

Of his eye and grasp of hand.

A "quiet eye" and true he bore.

Fair mirror of his heart;

He loved the dotted meadow more

By far, than busy mart,

And mountain pine and hemlock seen

To sigh in sad refrain.

As they shade the babbling brook's gleam,

"He never will come again!"

The May fly o'er the silent "deep"

When semblance of the east

Now tempts the hoary trout to leap

'Till its life is past.

The glowing comes, the camp-fire glows

With ever welcome graves,

But, from his new and long repose,

He comes not to his place

No huntsman's horn, no angler's glee

Can rouse him from his sleep,

But, in our stricken hearts, may we

His "memory green" are keep?

A-flick, or by the stream, he left

No "blaze" of shame, or grief.

A personum muffled and dolt

Our craft's Bayard indeed!

Time's silent stream on, ever on,

Unheeded by him flow.

It leaves us to the sort he saw,

Through "seasons" live and "close,"

We sign the cross upon his grave,

With rod of time bequeathed.

And, as we fish, on him we crave

Perpetual light may shine.

O. W. R.

### QUIET SPORT.—V.

BY WILLARD.

CAME the rain which we expected from the confident prognostics of the guide Rufe. He knew it from the position of the knobby clouds, the unusually bright color of the full moon. He was more certain of it from the unusually dull color of the waning moon.

He said that the moon sometimes reminded him of men he had known, who were brightest when they were fullest, and might dull and dim at other times—but at any rate came the rain.

A low and distant roar in the early morning and a southing among the hemlock were the first forebodings of the bright flash, and then came the thunder with its multiplied echoes in quick succession; a wild burst from the northwest, and the storm was here.

"Shut up your doors. 'Tis a wild night."

Though it was to be a day indoors, surely we could find some consolation in the fact that we were well housed for the present, and not obliged to chance a shanty which, in spite of all our precautions, might leak.

Uncle Phil's library was soon exhausted; whist and casino proved a bore; the morning wore away; noon-time came; still the rain came down, driving, drizzling, dizz, and we longed to get once more into the sunlight under the blue sky among the wild flowers and wilder birds and fishes. But at last the clouds broke away, and the sun showed his face in the west, giving promise of a bright morning.

Dick during the day had rigged up a trolling outfit, and with Ward took a few spins across the lake and landed several large lake trout, which proved an acceptable addition to Amity's table. Ward was well pleased with the novelty of trolling, which to him was a new method of fishing. He had lost a lake trout which had captured his

trout, and afterward he had fastened on to and landed the same fish. He knew it to be the same, for it bore the marks of a recent skinning.

"Such things are of frequent occurrence," said Roy. "Many an angler has caught trout or other varieties of fish and found old hooks embedded in their jaws. I was fishing for weakfish with an old partner of mine, Ed, Hulse, in August, '78, off Curtis's place, in Jamaica Bay. Now, Ed, rarely let a fish get away after looking it, and if one did break loose its escape might always be attributed to some weak spot in line or leader. On this occasion he had hooked a weakfish and he reeled him well up toward the boat, when the fish broke loose, carrying with it hook and about six inches of the leader.

"The accident was forgotten until sometime during the summer of '79, when fishing off Forked River, in Barnegat Bay, Ed, hooked a fish. He reeled him in, and lo! there he was. But she was a beauty; long, broad-shouldered, and how she glistened with gold and silver as she came out of the water into the sunlight."

"How do you know it was the same fish he lost in Jamaica Bay a year before?"

"Ed took this one home not suspecting in the least that he had caught a ladyship before, but when the servant came to clean and dress him, Master Hulse said, 'I never seed the likes o' this. Puth it, it's full o' little hooks. Begorra, I've pricked me fingers in a dozen places, had cess to it.' Ed, examined the fish and I'm a sinner if he did not find several hundred small hooks, and every one of them was stamped E. H."

"Of course you are a sinner in my estimation," said Ward, consequently I do not feel compelled to believe your fish-hook story. Still you will not doubt repeat it until you come to believe in it as earnestly as you do in your politics. It reminds me of the Scotchman who, being unable to write, obtained the services of a friend as an amanuensis. After dictating the local news and inquiring after friends and relatives he said, 'Tell Rob I caught a salmon this morning that weighed thirty-nine pounds.' The scribe, looking up, said, 'Why, Andy, that's the fish I caught a month or two ago, and it weighed in your life, much less this morning, for you have not wet a line this blessed day.' Archie answered, 'Matters a dam; per'er don, and down it went, and I have but little doubt that when Rob and Archie met Archie told the story of his fight with that salmon, and Rob wished he had been there to see, but I am willing to make all due allowance for exaggeration so far as fishing is concerned."

"All joking aside, I am ready to admit that the angler may sometimes give a rosate hue to his achievements, but it is never beyond what he truly feels and believes, for fish stories to the contrary, the angler has no more license to draw the long bow than has the lover of any other sport; nor does he, though he may be an enthusiast."

"You surely don't wish me to understand, after your fish-hook story, that the best of anglers don't stretch the truth and frequently break it."

"What I mean to say, and do say, is that you nor I would not vary from the truth were we talking of business in town or sport in country. We would not be justified in either. There are enough dissemblers to use a mild term, without our assistance. Angling is a gentlemanly recreation, requiring an inborn love of the exercise, masculine and sensible. To many it is a struggle for existence and becomes fishing, while to others it is a display of selfishness and slaughter, and a proving that they are theoretical and practical hogs, who would never give a hint of any information they might acquire which would help their best friend to capture a fish which they themselves might otherwise catch."

"You will admit in your heart all quietly to yourself that the majority of anglers are rather disposed to tell big stories; that they are lazy and shiftless, and all that sort of thing, won't you?"

"I'll admit nothing of the kind, not even to myself. Perhaps fellows who go a-fishing are too often what you describe, but the angler is a different person. The day has passed for him to bear the reputation of being lazy and shiftless. The class of men who have gradually come to the front as votaries and experts with the waving rod has worked a marvelous change in the estimation people hold of the sport. You know the saying, 'Tis not all of fishing to catch fish.' There are other reasons that prompt him to go to lake and stream. Some, I know, go for a grand spree. Theirs are familiar faces in pool rooms and at bars, where they will 'chuck' dice with graceful turns of the wrist, and win or lose swallow its consequences with a smile; but little or no care have they for the melody of running waters, the murmur, the lake, the beauty of the dawn, the prairie or the mountain, nor for any of the sights and sounds that gladden the eye and ear of angler or hunter."

The ideal sportsman is modest and reticent, except perhaps when among the genial enthusiasts amid the rod and reel. "His may be a heart that every hour runs idle, yet never once has gone astray." His leanings are to everything good in thought, in speech and action. His best loved sport is unalloyed by any debasing tendencies. It involves a healthy body, a calm mind and steady nerves.

With him there is no spirit of rivalry, and if there were, still there would be no jealousy, no taking advantage in any manner, no boasting of his achievements as an angler. He modestly keeps his score to himself if it be a good one, and does not exaggerate the results. His humor can never be numbered among his foibles, nor can it be said of him "he sucks in melancholy as a weasel sucks eggs." He is an optimist, always cheerful, and gives his companions the benefit of it.

A little boy was asked if his papa feared the Lord. His answer was "Yes, I think he does, for every Sunday morning when he goes out he takes his dog and gun along." Our sportsman would never resort to a Sunday.

He is appreciative of the beauties of nature. When the horizon gleams with the coming of the new day, and the west is radiant with all the colors of the sky above the sunset, when the lake is illumined with the silvery sheen of the moon, or at mid-day when tree and cloud and passing bird are pictured on it, while the sun pours its golden radiance upon the toun, or autumn revels in her gorgeous hues, he sees in nature something richer than anything in the world of art.

The untiring warbling of the birds, the music of the dancing waters rising in a thousand liquid notes, the golden buttercups, the shy forget-me-nots, the daisies and violets, the sunshine broken into fragments as it comes stealing and lingering through the leaves, are to him sources of inestimable pleasure, and he pays his willing tribute to divine goodness.

### ON THE BARTIBOGUE RIVER.

THE Bartibogue is one of those famous streams which empty into the lower Miramichi. Over the Tabusintac, chief of all New Brunswick trout rivers, the Bartibogue has once decided advantage in its greater accessibility. It is within a few hours' drive of the towns of Chatham and Newcastle. In the last of May or early in June sea trout come in from the gulf and wander their way by gradual stages up the smaller rivers draining the Miramichi basin. Not all these streams, however, do they look upon with equal favor; there are several of special beauty which they never condescend to visit. But the Bartibogue is one for which they show a marked partiality, and as it is a delightfully unobstructed stream, and affords easy wading almost everywhere, and its run-trout is generally initiated by a trip to its sunny valley.

It is a profitable as well as honorable distinction to be the first in the field, for the earliest fish are among the finest, and are least discriminating in the matter of flies. Their favoritism for the first few days is a large red and tawny fly with white wings. Later in the season, under the influence of fresh water and civilization, they begin to evince more individuality and capriciousness in their tastes, becoming much like any other trout.

Ambitious, therefore, of being the earliest to greet the new arrivals, on the 27th of last May a party of three, the writer included, left Chatham at daybreak for the banks of the Bartibogue. We represented three professions whom difficulties are never known to daunt—we were an editor, a politician and a pedagogue—so that success of some sort would attend our efforts might be deemed a foregone conclusion. Our day of some ten miles through the white and misty morning, which was fast breaking to blue and promising a day more clear than we desired, brought us at last to a narrow, green lane leading a tortuous mile or two through marshy grounds to the river. By the bank we unharnessed and tethered our horse, intending to make a day of it in this vicinity. The spot was about a mile above the best one stream for spring fishing, a mile above "head of tide," and we confidently anticipated a day of successful sport.

The editor and the politician, whom for brevity we may designate Ed. and Pol., promptly got their lacewoods together and went to work with characteristic alacrity; while I sat splicing my pet greenheart with great deliberation, in no haste to wield it on new waters. My friends were habitually of the opinion that I was a stranger to it. Our day whose generosity we have experienced, whose friendship we value, we approach with open cordiality; but for my own part I confess to a feeling of reserve, I am loath to make too ready advances, when coming in contact with strange waters. However, Pol. had scarcely made a cast ere he struck a half-pounder, and landed it. It was not a sea trout, but an ordinary brown, and, as it turned out, a solitary wanderer, but it certainly awakened my eagerness, and I rushed into the fray. There was another rise at Pol.'s feather, and he began insouciantly jerking at the Editor and the Pedagogue; but it was only a chub this time, and we crowded over his prompt humiliation. How thoroughly every square inch of this famous pool was whipped. Ed. climbed into his monstrous rubber trousers (he was a fastidious man, after the manner of his kind, and, dressed, protesting his fly, and waded across there at noted points to prospect for more. Our day in all directions, but in vain. Not another rise blessed our vision. Then the eyes of Ed. and the Pedagogue were opened to the dreadful fact, that for the first time on record this pool had gone back on its reputation, and we made a move for fresh fields. But the Politician could not realize it. He had never heard of such a thing as going back on one's word, and he was not at all disposed to do so. He was of the Bartibogue's standing. He said it was our evil influence that was paramount just then, and he would stay behind us. When we should be gone he felt sure ill luck would vanish. So we pitied him a little and then went away, after hiding the dinner-basket.

We traveled nearly a mile up the stream, now wading, now footing it by land, now casting systematically, but stopping here and there at noted points to prospect for more. Our day did not long remain empty. That of the Editor was adorned with three small emper, mine with a six-inch trout and a red-fin. We saved these trophies to propitiate our deluded friend Pol. At length we sat down, faint at heart, upon a rock, and after a minute investigation of the case in all its bearings, we were forced to the conclusion that our country was a barren waste for the day. "No, I do not," he said, "I am not a politician, I am a fisherman, and as the bitter truth stared us in the face, I think I must acknowledge we broke down. At last, with a world of paths in his voice, the Editor arose and moaned: 'We'll go back and eat some dinner. Then, if we're well enough, we can drive down to head of tide and have a little try for bass.' So we began to retrace our steps down stream.

It was easy wading with the current, and we lost no time. But the stream at this season was high and turbulent, and from the heedless, indifferent style of Ed.'s locomotion, which was that of one who has lost his relish for life, I began to dread some accident. At last it came. Ed.'s height was but five feet three, though his breadth was sufficiently ample. His water-proof breeches, before mentioned, had been made for something more than a six-footer, so they came well up under Ed.'s armpits. Here they were gathered somewhat loosely, as their wearer had no intention of being submerged to that depth. Nevertheless, his lack of intuition availed him not to prevent it. He was plunging forward blindly, thinking of his uncouth trout, grating speckled bereties of two pounds, three pounds, three and a half pounds, may be, who knows! How, with well disguised triumph he would have displayed them to the passengers of the steamer. The appetizing breakfast of which he had dreamed of for to-morrow, while a few splendid trophies of his piscatorial skill were to have gone with his compliments, to grace the tables of his friends.

Thus I interpreted his musing from the expression of his face, when suddenly there was a revolution. His mouth and eyes opened very wide, his arms flew up, and he stood in a hole filled with the chill current up about his chin. I plunged to his rescue, and together we struggled toward the shore. The water was simply a wall of water, and it was not until we had dived under the water that we were able to get into the shallows. Ed.'s trousers held a great volume of the insidious fluid, and as the outside water withdrew its support his legs grew almost immovable, owing to the weight they carried. But he was finally trundled out upon the bank, when, well anchored down by his ponderous pantaloons, his dripping suit was simply a nuisance. He looked at the incursion of the water with a simple air, and then, with a sudden inspiration, seized him and shone across his face in a spasm of

*To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.*

## BENCH SHOWS.

June 12, 13, 14 and 15, 1883.—Chicago Bench Show, Chicago, Ill.  
Entries close June 1. Chas. Lincoln, Superintendent.

November 19, 1883.—Eastern Field Trials Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1; for the Members' Stake, Nov. 17; for the All-Aged Stake, Nov. 1. W. A. Foster, Secretary, Flatbush, Long Island, N. Y.

November 29, 1883.—Robin's Island Club's second Annual Field Trials at Robin's Island, L. I., for members only. Entries close Sept. 1. A. T. Plummer, Secretary.

December, 1883.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Bryson, Secretary. Memphis, Tenn.

### Editor Forest and Stream:

Patiently have I waited to read the various criticisms amiable and caustic pens have made in your journal upon the recent bench show in this city, and my amazement has been intense. Nearly all your reporters and correspondents have not only awarded great praise to the management of the show, but have also complimented the dogs! I did hope some of the many exhibitors, including I consider the best, would have said the poor suffering animals were benched for our delectation, would have had the courage to come to the front and express the views they stated to me. I say "poor suffering animals" because I consider four days just one day too long for dogs and cats to exhibit in the strange surroundings of a crowded nervous and oftentimes inhuman crowd, and well, and are, most of them, thoroughly demoralized at the end of that time. Some of them undergo tortures. Very few of them are accustomed to Spratt's biscuits, but have never tasted them, and naturally they decline all food except what they are used to. Therefore, all food they eat is bitter; and it is my sincere hope that the next Boston Club will think seriously of the propriety of making their show's duration hereafter three days instead of four.

Before I criticise the dogs let me add my wreath of praise to the many laurels already thrown at the feet of the managers. The system adopted was thorough and satisfactory. The dogs were well cared for, and the spectators, and the gentlemen concerned have certainly every reason to congratulate themselves upon their brilliant success. Mr. Lincoln was always efficient, thorough and polite. Beauty and grace, and culture and civility, all that womanly graces which are the glory of the female sex, were represented in the thorough which clustered about the benches, dwelling very clearly what a tight hold their canine excellencies had upon the affections of our citizens. And there, too, were found the hard-headed sons of toil and the tired women who have toiled and toiled for the benefit of every one, and then having some sharp or witty, or appropriate, or kind criticism to offer, or loving words wherewith to soothe the sorrows of their pets. And I said to myself as I wandered amid the crowds and witnessed the excellence of the arrangements, I said to myself, how good as the managers' management is perfect, why the least could be more.

Now, seriously speaking, Mr. Editor, a poorer lot of dogs of the many breeds exhibited, it seems to me, it were hard to get together, unless we took nondescripts. This opinion is shared by a great many with whom I had the pleasure of conversing, especially as regards the pointer and English setter classes, and many of the non-sporting dogs. I will enumerate

To take the first six. In all thirty-two were shown, dogs and bitches. With about four exceptions how many would have been seen to compete at the Crystal Palace, Alexandra Palace, or the Birmingham Bazaar. The first is a bitch, of course, and, of course, of the same breed. In her, however, the faults of distance, muscle, size, form, and indeed the general attributes of the breed are so manifestly wanting, that I cannot but regard her as a genuine mastiff lamentably wanting. The winner in the champion class, Neilson, is a dog who never took a first prize at any of the above-named shows, and who is, I think, the best in the world. He is defective in head, is leggy and badly knuckled, his hind quarters are excellent, but in head, shoulders and as far as his loins he was inferior to many. His coat is splendid, and his tail is a fine specimen of the breed. I think his only competition by reason of an accident. But grand and majestic as he is, I can criticize him, too. Immense in size, and in measurement unusually large, he is defective in loins and tail, and his hind legs are a little too short. But these faults are compensated for in this. Still he is faulty. The others present in this class I would never dream of considering as

pure mastiffs. "I have seen," says my very excellent and genial friend, Mr. Vatson, made a serious error, in my opinion, in awarding first prize to Tiny, and second to Rover. Cato, although somewhat small, would in England, where this breed of dog is much more highly valued, have been a more successful dog of a doubt. He comes nearer to the true type of mastiff than any dog competing in that show; and has just what we need here, the short square muzzle, flat head, and lots of muscle about the neck. He is a fine specimen of his breed, and has a human baby. Rover has a wretched head, sharp muzzle, bad stern, and his breast and forelegs are covered with white. Tiny was deficient in squareness of muzzle, too long from the eye to the ear, and too short from the ear to the jaw, for quality. The others were not worthy of mention as true mastiffs. Compare these animals with such masters of the noble breed as one of Turk, Mr. Luky's Governor, as Wallace, the Duke of Devonshire's, or the Duke of Devonshire's, the Shah, Crown Prince (sire of Cato), Sir Garnet, as Creole, or his palmy days, and others almost equally as good, but which I cannot describe my memory, and where would they stand? Each would be a fine specimen of his breed, but the standard specimens because several writers have recently characterized our show of mastiffs as the "best ever collected to London." Each would be a fine specimen of his breed, but the infancy yet in every breed, and it is only by telling the truth and flattering nobody, we can reach improvement.

St. Bernard's class, were poor. I saw Bonifaz take first prize in London at the Crystal Palace show in 1881, and I have since then been a devoted admirer of dogs thought by some of the best judges there to be his superior. I have saved and reared him, and he has been my favorite dog and Rector. His muzzle appears to me rather sharp, and he certainly is deficient in strength of loins and general style and showiness. In my humble opinion Mr. Hearn's dog is a much better specimen, but the carriage of his tail. That caudal appendage of curls is little to be desired, otherwise he is the grander dog of the two. I do not think much of the others in the open class, but quite agree with the award to Caesar the victor's crown. But all of these dogs are good dogs, and I am glad to find the presence of some of the grand animals which I have seen and admired and whose superb proportions loomed up before me as I wrote, but I could not do better conscientiously than put, last, after any of their names. And so I wonder when I read that Sir John Lubbock, the great naturalist, and the "finch-brown" Truly, "Where ignorance is bliss, it's folly to be wise." In this connection, let me say to lovers of St. Bernard that the randest dog probably in the world of this breed is one named Rector now owned by Mr. Smith of Leeds, Eng. Mr. Graham, the English champion, is a much better specimen than I agree with me. I saw this splendid fellow all over here, and he was then but two and a half years old. He was in

retched condition, but the most massive, the most majestic, the most perfect specimen of a dog of my breed I ever beheld. It was worth going many miles across land and sea to look at him. Dignity, grandeur, style, stature, all combined to make an impression of the canine persuasion, nature seldom sees here. He stood over fifteen hands high, and his neck was as thick as an over-lippen. I measured him over thirty-five inches high at shoulders, and nearly the same from the loins to ground, and then the hair was lifted up for the standard, and it measured nearly thirty inches. He was a perfect specimen written to Mr. Graham about him, and which I have preserved here: "He is the best coated dog in England, and the biggest dog in the world, as well as the biggest St. Bernard." He stands thirty-five inches, full measure, and is as well on his legs as any dog I ever saw. He is all together. His pedigree is second to none." I can more than corroborate every word of this. He has won first ever since Mr. Smith obtained him, completely turning the tables on the other dogs of the breed. He has won first for 150 pounds, and is by no means fat. I mention this for the benefit of lovers of this noble breed, hoping some gentleman of wealth will bring him across the water. I have his full pedigree, and he is a perfect specimen of the breed, and he would have been nine mile long ago. We want just such matches annual to cross with our bitches.

[illegible]

"I come now to Newfoundland dogs in the show. Was there one there, Mr. Editor, that could be named in the same day with Mayor of Bingley? He was first, as he always has been in England and this country. It was literally a case of the yacht America when she raced round the Isle of Wight for the Queen's Cup, "the America first, the rest nowhere!" And yet we have read in some of the daily papers of the "grand class of Newfoundlands!" Your own journal, Mr. Editor, said truly, "With the exception of Mayor of Bingley, there was not a 'good one in it.'"

4. Greyhound.—Well, the less said of this class also the better. I place Friday Night first, the rest nowhere when compared with this truly good specimen of the racing greyhound. And much to my amusement and amazement, I critic in a New York papersays of this dog, that "he is better fitted for the parlor than the field, being a stylish, handsome dog, but too delicate, nearly approaching the smaller Italian type." And Clio he calls a "magnificent typical greyhound." Great! I place Friday Night second, the rest nowhere. Friday Night to be larger in size than the famous Master Marston, and the peerless Comanche both winners of the Vetoctorate.

three times. I found him an animal of wonderful muscle and grand legs, and feet, oblique shoulder-blades letting the legs come well to the front, a bark "like a beam," deep ribs, and broad, powerful loins, and stifles as good as a hare's. Better development of muscle in loins, and better stifles, wide apart, it were not easy to find. What could have possessed any judge of a coursing greyhound to think such an animal "better fitted for parlor than for field" I fail to discover. It is *mirabile dictu!* Poor, meane Clie. I felt sorry for her. She was a good dog, and I was glad to see her, and properly declined to award her a prize owing to her misfortune.

6. Pointers.—A poorer, weedier, seedier looking lot it has never been my ill fortune to behold. And in this view I am upheld by nearly every man of keen discerning judgment who visited the Garden.

[illegible]

I find the same faults with English settlers as a class, that I found last year, and for which "Pickett" rather scolds me.

made that all sea water containing spat shall pass near these collectors, and to aid this the water is diverted by various currents. This is accomplished by wire cages, which are covered with asphalt, or coal tar, as is done by our fishermen, and in these the infant oysters are kept for a while after removal to other waters. They are then assorted into different sizes and planted in the shallow water culture, as not the best seed, but of our countrymen have been so successful in doing this, and the other nations have been so successful in progress made by Prof. Rye and Ryder who have succeeded in hatching the young oyster and keeping it until its shell was partly formed, and both hope for increased success.

"The Natural History of the Herring," by George Sim, will interest pisciculturists, and an essay with the same title by William Ramsay, Esq., will interest anglers. The latter is a paper entitled "Harbor Accommodation for Fishing Boats on the East and North Coasts of Scotland," by Archibald Young, Inspector of Salmon Fisheries for Scotland. In this are depicted the various stages of the herring fishery, from the spawning time to the salting. The salmon disease is treated of by Andrew Brotherton, and is a most important topic for the latitude of Great Britain, where it has raged to a great extent. Mr. W. O. Chambers has two essays, one on the artificial propagation of salmon, and the other on the artificial propagation of trout, both experimented with, and an apparatus for pumping sea water for use, such as we hope to see at the Cold Spring hatchery, was arranged, and the first experiments were quite satisfactory. The fresh water disiculture consists of recommending what should be done. It is gratifying to note that Englishmen begin to realize that their country is behind most others in pisciculture, and that they are not the only ones who are ignorant. I knew it, while they looked up to him as the greatest of authorities on the subject. In another article Mr. Chambers recommends the introduction of many foreign fishes, but says that the hatchery should be established in Scotland. As to the hatching and rearing the latter description of fish I cannot say much in its favor, with the exception of its handsome appearance, and after a trial extending over several years, I have discontinued hatching it. We wish he had been more explicit.

The volume is handsomely illustrated, and has many other interesting articles which our space forbids reviewing, they being mainly connected with the commercial fisheries.

**THE FISHES EXHIBITION.**—At the International Fisheries Exhibition, now in progress in London, the exhibit of the United States calls forth words of praise from all for its completeness. The fact that it is mainly made up by the National Museum and the Fish Commission renders it free from the fault of being a collection of specimens of the sort of tent which occurs when sent by individuals. Mr. Blackford makes weekly shipments of fresh American fishes, and this week he forwards a lot of fine Nevada trout, *Salmo clarkii*, which came through from the Pacific coast in splendid condition. The exhibit also contains a lot of the famous Ichthyophagous Cichlid, of New York; these are handsomely printed and embellished and surround the poem, "When the Ichthyophagous Blues," by Mr. Matlier. A large frame contains pictures of the various American ichthyofaunas, and the display of the fishes of the world. The anglers have done themselves great credit in making a display.

DELAWARE SHAD.—Philadelphia, May 25. The shad fishing on the Delaware this spring has been well up to a failure. The fish caught at Gloucester and Howell's have been of good size, but the meagre catches has put the price so high, a good shad is quite a luxury. It is said the trouble lies in the setting of fish baskets on the spawning grounds in the upper part of the river, and that an open violation of the game laws is carried on yearly without molestation. What is wanted is a proper carrying out of the statute by the authorities in whose right the power is vested, and until this is done, all the planting of spawn or fry on the part of the commission will be of little use. It is given to serious question, and prompt attention should be given to the subject. H.M.O.

**SHAD FOR THE HUDSON.**—On Saturday last the United States Fish Commission sent its transportation car No. 1 to Troy, N. Y., with 1,500,000 shad fry, which were deposited in the river there. The car was in the charge of Mr. G. H. H. Moore, and was visited in New York by Hon. E. J. Roosevelt, Mr. E. G. Blackford, two of the New York Commissioners, and accompanied by Mr. Fred Mather, superintendent of the Cold Spring hatchery. The fry were hatched in the old armory at Washington from eggs taken on the Potomac. The fry were deposited between Starbuck's and Green islands, opposite Troy. Another car for the same place is expected this week.

DEATH OF L. CHARBONIER.—We learn with regret of the death of M. Charbonier, the leading fishculturist of France. His labors have partaken both of a practical and a scientific character, and his reputation was world-wide. Under his direction the splendid Trocadero aquaria were built for the Paris Exposition, and he was especially active in importing foreign fishes. His loss will be felt beyond the limits of his native land.

**THE FISHCULTURAL ASSOCIATION.**—The American Fishcultural Association will hold its annual meeting at the Farmers' Club room in the Cooper Institute, New York city, on Wednesday and Thursday, June 6 and 7, beginning at 10 A. M. each day. Several interesting papers are promised.

Jay Gould wants his friends to recommend a name for his new yacht, in which he will go to Europe in June. We would suggest "Western Union," as that floats on water about as well as anything we know of.—*Lowell Citizen*.

CARLSBAD is an Austrian town of twelve thousand inhabitants. It is a thriving manufacturing place, but a main source of its prosperity is naturally the mineral waters. The springs which give it its name were discovered by Charles IV., King of Austria and King of Bohemia. The local legend is that he discovered them in the year 1351 while on a hunting excursion. A dog, too eagerly pursuing a deer, fell into one of the hot springs; his yelping brought the Emperor forth upon the spot, where the thermal water, wreathed with clouds of vapor, pulsed out of the cleft of the rock. The huntsmen, rushing in after their leader, named the place Charles's Bath, and Carlsbad it has been called to the present day. —*Harper's*.

AN HONORED DOG—For some years past two ladies have been seen passing daily through Ninth street in Brooklyn, to Prospect Park with an evidently aged but still noble-looking Newfoundland dog. He usually walked slowly and painfully between them. They often stopped for the animal to rest, and when he was tired they would pick him up and carry him. They were permitted to bathe him in the park lake. About a month ago he died; a costly coffin was made for him, and he was buried in the family lot in Greenwood cemetery. Inquiry reveals that several years ago the ladies, mother and daughter, were carrying out on their dog, and the dog was transferred with the dog from the ship to the beach, the boat was capsized. The dog rescued the daughter, and returning through the surf, aided the life-saving crew in bringing the mother and daughter to shore. The dog was a noble animal, was treated with the utmost affection, and was sincerely mourned when he died of old age.—*New York Tribune*.

MR. HOWARD HARTLEY'S LEMON AND WHITE ENGLISH SETTER DOG "ROYAL RANGER."  
Winner of First Prize in Open Class at New York, 1892.

ing himself of all prejudice in favor of any fancy of his own and trying to stick as close to a recognized standard as possible. In other words, by both exhibitor and judge being entirely reasonable and unbiased, and as that is getting pretty close to the millennium I guess I had better stop. W. WADE.  
Pittsburgh, Pa., May 24.

"DOGS NEVER REASON."

IN FOREST AND STREAM of May 10 there is a brief article under this caption, by "The Old Doctor." Duke's disposition of the chain would seem to indicate an exercise of the reasoning faculty. The proposition may not have taken the form of a syllogism in Duke's brain, but it was syllogistic in the highest degree. A human being could scarcely have done better. All dogs may not reason; not all men reason, but some do, and the same may be said of dogs. In company with a friend I was duck shooting on one of the marshes in Minnesota. We stationed ourselves about thirty rods apart and began business in a very lively manner. In less than half an hour I had killed a dozen mallards, and my pointer dog, Charley, had placed them at my feet. My friend, who was a novice at the business, had fired a number of shots without any effect. He insisted that he had made a number of "pensioners," but they managed to get away. He finally condemned his gun, and expressed himself as completely discouraged. Just then I dropped a brace of mallards within thirty feet of my blind, and Charley, picking up one of the birds, paused a few seconds, and then proceeded to deliver it to my friend. He returned and made the same disposition of the other bird. This act had a most exhilarating effect upon my friend, and he renewed his efforts with great enthusiasm. The results, however, were very unsatisfactory. Meanwhile Charley continued to divide the dead birds between us, and, to our great surprise, we found at the close of our evening's shooting that the division had been made with mathematical accuracy. And now, if anyone suggests to my friend that "dogs do not reason" he will insist that there is at least one exception to that rule, and more than this, he firmly believes that Charley can count. T.  
BRANTFORD, ONT.

THE GORDON STANDARD.

*Editor Forest and Stream:*  
Dr. J. S. Niven's standard in your issue of April 12 allows five points for color. I think color is a great point in the Gordon; a rich, glossy black, and a rich mahogany tan, without mixture of either color, gives a beautiful harmony, and allows ten points for color and feather. The head is another very important thing. The skull should be high at the occipital, at the same time broad and well proportioned. The head should show no thickness below the eyes. Nose, 4½ in. long and square. Lips quite pendulous. Ears hang low and well feathered. Eyes large and round; color, dark brown. Neck large, not throaty, and well placed in the shoulders. Shoulders large and rising above the back. Chest wide and deep. Ribs round and well sprung. Back and loin very large and muscular. Distance between ribs and stifles short, not gaunt. Quarters muscular and heavy. Feet well haired and round. Height 25 in. at the shoulder. Tail spike-like, with heavy feather. Fore legs straight, with large bone. Hind legs long and well crooked. Shoulder rise ½ in. above the hips. Weight 55 to 60 lbs. for dogs, and 45 to 50 for bitches. The color should be free from white. With an intellect and a pedigree showing Gordon breeding for years back, makes up my idea for a Gordon setter. Below is my standard:

Head, ears, muzzle and eyes.....	20
Neck.....	5
Body, ribs and height.....	10
Shoulders and weight.....	10
Loins and length of back.....	10
Quarters and stifles.....	15
Feet and legs.....	10
Color and feather.....	10
Coat and style.....	10
Total.....	100

C. T. BROWNELL.  
New Bedford, Mass.

"AMERICAN KENNEL REGISTER."—The entries for the June number of the *American Kennel Register* will close tomorrow, June 1. Blanks are sent upon receipt of stamped and addressed envelope.

ROYAL RANGER.

OUR illustration this week is of the English setter dog Royal Ranger, winner of first in the open class at the recent show of the Westminster Kennel Club. He is owned by Mr. Howard Hartley, of Pittsburgh, Pa., who imported him a short time ago. His sire, Royal, is by Hollick (Roll II—Belle out of Flame (Elkington's Bush—Carrie), and his dam, Novel, is by Blue Prince II (Blue Prince—Cora) out of Flame (Hall—Coutess). He is a dog of good size and great beauty, with plenty of bone and muscle. He has appeared in public but once before, winning second at Pittsburgh in April.

EASTERN FIELD TRIALS DERBY.

THOSE intending to enter their dogs in the Eastern Field Trials Derby, should bear in mind that the entries close on July 1. We expect to see a larger field of starters for this event than has yet appeared at any previous Derby. The prizes offered are well worth the winning, but the honors achieved by those who win them are generally of far greater value. Even the beaten ones who acquit themselves well, receive from the public a nod of praise that is never bested upon the stay-at-homes. Breeders are aware of this, and many of them will send the pick of their kennels to display their quality, and judging from the number of entries already received, we shall undoubtedly see at High Point the most notable gathering of youngsters that has ever been seen in this country. In addition to the liberal prizes offered, the president, Mr. Elliot Smith, will give a valuable cup to the breeder of the winner.

THE FAR-FAMED DOG OF THIBET.

IT is a century since Warren Hastings, whose predilection for rare animals and desire to acclimatize them served to occupy and amuse the leisure of his later years, endeavored in vain to obtain specimens of the far-famed dog of Thibet, and we are not aware that any other person has been subsequently more successful in introducing the breed into this country. Owing, however, to the kindness of Count Szechenyi, a Hungarian nobleman, an account of whose interesting travels in the Far East was published some two years ago, the Prince of Wales (says the *Times*) has become the possessor of a male and female of the race, and will probably, with all his wonted liberality, afford the public an opportunity of seeing them in Regent's Park during the ensuing season.

Count Szechenyi had heard so many reports in China—where, however, they are almost as great strangers as with us—of the size and beauty of these dogs, that he was very anxious to become personally acquainted with them, and on the first opportunity, which presented itself at Batang, the frontier town of China on the route to Lassa, he purchased three, at a very considerable price it is understood. He found that they were fully deserving of their reputation in looks, courage and sagacity. In some respects they are said to resemble the lion-dog, or spicimens of the Newfoundland breed, but have a head very much larger, to which, moreover, an air of imposing dignity, if not fierceness, is added by a thick, shaggy mane, which grows forward so as to encircle the face like a drill. Their formidable aspect is still further enhanced in their native mountains by artificial means; for the shepherds and herdsmen who employ, and are very proud of, these useful yet dreaded animals, often fasten round their necks bone-like wreaths made of the bristly hair of the yak, and painted red—a species of decoration which gives them a still more lionine appearance than that which they owe to nature.

Indeed, some drawings we have seen of them strongly recall to mind the king of beasts as imagined in heraldic devices—e. g., in the arms of the Duke of Argyll. The color of their coat varies from black to light brown, the former predominating. The people of Thibet find them invaluable either to guard their flocks or as house watchdogs. In the latter capacity they display the utmost fierceness and hostility to intruders on their master's property, and would be truly dangerous if not tied up by strong chains during the day, even when they secured their furious barkings and mad efforts to escape started the passing traveler, and warn him to give them a wide berth. It is curious that the rapid movement or wagging of the tail is with them a manifestation of anger, and not of friendliness, as it is with their European cousins.

As guardsmen of the sheep and yak caravans, implicit reliance is placed on them; they preserve peace and order among their subjects as effectually as Eastern despots of the better sort, and, perhaps, after the same fashion—viz., by short snuff

and heavy tolls; at any rate, they gallantly defend them when attacked by man or beast.

The two individuals who are about to visit our shores bring with them a good charter for docility; at least, they soon became attached to their Hungarian, as it is to be hoped they will be to their English master. Their names are Chandu and Zama. The fate and character of the third dog of this interesting group were different from those of his companions. Like a true follower of the Lamas, he was a declared enemy of Europeans, and would accept no overtures of amity from them. Count Szechenyi, who strove to propitiate him by feeding him with his own hand, was repeatedly bitten, and on one occasion very severely. His antipathy was, however, not confined to the white faces of the foreign devils, for a poor Chinese old woman, whom he encountered in the streets of Bhamo, was so maltreated by him that she died almost immediately. This wanton act filled up the measure of the irreclaimable brute's iniquities, and was at once avenged by a bullet from his master's revolver.—*Live Stock Journal*.

CURRENT DOG STORIES.

1. Much excitement was caused at an English opera house the other night, during the performance of "Uncle Tom's Cabin." Mr. Charles Herrmann, who took the character of George Harris, has three bloodhounds, with which he is supposed to struggle on the stage. Unfortunately the dogs were brought on unmuzzled, and in the excitement of the moment they lost their temper, turned on their master and bit him severely. Had not assistance been at hand, Mr. Herrmann would have been seriously injured. After having his wounds dressed he continued the performance.—*Evening Post*. (In a Brooklyn theatre last Wednesday night, the play being the same, the "bloodhounds" had a big fight on the stage.)

2. At the Union street wharf yesterday there was an exhibition of canine depravity that was as amusing as it was remarkable. The dog in question was an experienced thief, and entered into the work of thieving with all the zest of an experienced hand. On the occasion in question a schooner was unloading coconuts on the wharf, and, as usual, a crowd of boys were on hand to pick up whatever they could. As it was hard for them to sequester any of the nuts without detection, the natural or acquired depravity of the dog in question was made use of, and he was made the agent through whom a good supply of said nuts was secured. A boy would step up to the pile of nuts, and would apparently accidentally kick one a few feet. At once the dog, would seize it, and a big coconut and a small dog rapidly vanished up the wharf and around the corner. Being relieved of his burden by a boy in the conspiracy, the dog would come back, and, when a good nut was selected, would take it away, to have it added to the heap stolen. This continued for some time, and was enjoyed by some who saw the affair.—*San Francisco Bulletin*.

3. An engraving of Woolner's bust of Tennyson, used as a frontispiece, and two beautiful full-page pictures of Thornycroft's masterpieces are among the illustrations to Edmund W. Gosse's "Living English Sculptors," in the June *Century*. The writer tells the following anecdote of the dog in the statue of "Artemis": "In 1884 Mr. Thornycroft made another great stride forward with his 'Artemis,' a statue of heroic size, which has since been set in marble in Eaton Hall, the seat of the Duke of Westminster. We give an engraving of this figure seen from the front. The goddess advances through the forest, and suddenly arrests her steps as she sees the quarry in front of her; with a dignified action she lays her hand over her shoulder and takes an arrow from the quiver, which rests on her left. The other hand, which bows in it, passes behind her back and is drawn against her right hip by her hand, which has strayed on the wrong side. This dog has been much admired, and a little anecdote concerning it, which has not been recorded, may be worth telling. The sculpture had arrived at the point when he wanted a hound as a model, and he could find none that suited him. On the very day when a dog was to have been finally fixed upon, there came to the studio door a very beautiful deerhound, without any collar or mark of ownership, which seemed to have suffered much privation, and which absolutely refused to go away. The model was exactly what Mr. Thornycroft wanted, and while every effort was made to find the dog's master the charming creature sat for her portrait. The model claimed her, and she became the pet of the household; but the effects of

her long exposure brought on a decline, and, in spite of all the care that was taken of her, she died on the night of the day when the nation's first annual trial was held. The sad tale, with the utmost confidence, that the goddess had sent her, and when her work was done had taken her away again."

### THE EASTERN FIELD TRIALS CLUB.

[CONCLUDED FROM PAGE 351.]

#### REGULATIONS, RULES, FOR RUNNING AND INSTRUCTIONS TO JUDGES—TRIALS, 1888.

Rule 1.—The management of meetings for the Annual Field Trials shall be entrusted to the Executive Committee of the Club, and they shall enforce the rules of the Club under which the dogs are run.

Rule 2.—The judge, or judges, shall be selected by the Executive Committee, and their names shall be publicly announced as soon as possible after their selection and before the closing of the entries. When a judge, from ill health or other satisfactory cause, is prevented from attending a meeting or refusing it, the Executive Committee shall have the power of deciding what is to be done.

Rule 3.—Every subscriber must name his dog, at the time of entry, describing his color, markings, and giving the names of his sire and dam.

Rule 4.—For all stakes the names, pedigrees, ages, colors and distinguishing marks of the dogs shall be detailed in writing to the secretary of the club, to be filed at time of making entries. Any dog's age, markings or pedigree which shall be proved not to correspond with the entry filed shall be disqualified, and all such dogs' stakes or winnings shall be forfeited.

Rule 5.—Dogs to be eligible to the Eastern Field Trial Derby must be whelped on or after the first of January of the year preceding the trial for which the dogs are nominated. Dogs are required to retrieve.

Rule 6.—The forfeit money must accompany every nomination, and the balance of entrance fee must be paid before the draw.

Rule 7.—The Executive Committee may reserve to themselves the right of refusing any entry they may think proper to exclude, and no person who has been so refused to enter by the Executive Committee, to have miscondemned himself in any manner in connection with dogs, dog shows or dog trials will be allowed to compete in any trials that may be held under the auspices of the Eastern Field Trials Club.

Rule 8.—Immediately before the dogs are drawn at any meeting, the time and place of putting down the first brace of dogs on the following morning shall be declared and posted in a conspicuous place. Rule 9.—All stakes shall be run in the order of the programme, unless the whole of the competitors or their representatives in the various stakes may agree otherwise, in which case the order may, with consent of the Executive Committee, be changed.

Rule 10.—When two dogs, owned or handled by the same person, are drawn together, one of the dogs' names shall be returned to the underwriter numbers, which shall then be well shaken and another name drawn in its place. If at the latter end of a trial it is found impossible to avoid running two dogs together, it then may be permitted.

Rule 11.—A natural bye shall be given to the lowest available dog in each race. No dog shall run a second bye in any stake unless it is unavoidable. When a dog is entitled to a bye, either natural or accidental, his owner or nominator may select any available dog to run off the bye—from the beaten entries in his stake—if required so to do by the judges. If there is a natural bye and a dog drawn to run at a brace with a withdrawn without running, then the remaining dog of the brace shall run as a brace with the bye.

Rule 12.—Every dog must be brought up in its proper turn without delay, if about ten or more minutes, the winner and its opponent shall be adjudged the winner and entitled to the heat, and shall in that case run a bye, as provided in rule eleven (11). If both dogs be absent at the expiration of twenty minutes from the time of call to run by the judge or judges, the judge or judges shall have the power to disqualify both dogs, or fine the owners any sum not to exceed the amount of ten dollars.

Rule 13.—An owner, his handler or his deputy may hunt a dog, but it may be one or the other, and when dogs are drawn an owner must not interfere with his dog if he has disputed another person to handle and hunt him. In member's stakes a dog must be handled entirely by his owner.

Rule 14.—The person handling and hunting a dog may speak, whistle and work him by hand as he may deem proper, but he can be called to order by the judges for making any unnecessary noise, and if after being cautioned he persist in doing so, they can order the dog to be taken up and adjudged out of the stake. An opponent's dog cannot be purposely interfered with or excited, or an appeal can be made to the judges. If an opponent's dog points game, the other dog is not to be drawn across him to take the point, nor if not backing of his own accord he may be driven around behind the pointing dog. Dogs must be hunted together, and their handlers must walk within a reasonable distance of one another.

Rule 15.—If a dog be withdrawn from a stake on the field or at any time during the holding of a trial, its owner or his deputy having authority shall notify in writing, with his name attached, the Secretary or one of the Executive Committee of the Club before the trial, either orally or by these officials, the notice must be handed to one of the others. When a winner of one or more heats is drawn for any reason other than defeat, the dog or dogs previously beaten by him shall not be deprived of competing for second or third prize, in the opinion of the judges, they may have a chance to show him.

Rule 16.—If any subscriber, his deputy or handler, openly impugns the actions or decisions of the judge or judges during the progress of a trial, he shall forfeit not more than \$20, nor less than \$10, at the discretion of the majority of the Executive Committee of the Club.

Rule 17.—When two dogs, the property of same owner, or of confederates, shall remain in for the deciding trial, the stake shall be considered divided, and the owner or deputy of one of the two dogs may have a chance to show the other dog to draw him for a consideration or bribe of any nature whatsoever. If, however, either dog be drawn without consideration, from lameness, injuries, or from any cause clearly affecting his chances of winning, the other dog may be declared the winner, on the facts of the case being clearly proved to the satisfaction of the judge or judges. This same rule shall apply when more than two dogs remain at the end of a stake, which is not run out; and in case of a division of two or three or more dogs, of which two or more belong to the same owner, these latter shall be held to take equal shares of the total amount won by their owners, and in the division the terms of any arrangement made by the owners, and the amount of any money given to induce the owner of a dog to draw him, must be declared to the Secretary.

Rule 18.—Any objections to an entry must be made in writing, addressed to the Secretary of the Club, and will be acted on by the Executive Committee, whose decision will be final.

Rule 19.—No person shall be allowed to enter or run a dog in his own or any other person's name who is a defaulter for either stakes or forfeits in connection with the trials or dog shows, or for any money given under an arrangement for division of winnings, or for penalties regularly imposed for the infraction of rules, by the Executive Committee present at any meeting, or for any payment required by a decision of the Eastern Field Trials Club.

Rule 20.—Dogs shall be drawn in braces by lot and run in

heats, the beaten dogs to be retired (except as in hereafter mentioned), and the winners to be run again in the order in which they ran the successive heats. The last dog beaten by the winner of the first prize shall compete for the second prize with the best of those dogs previously beaten by the winner of the first prize. The winner of this heat shall be declared the winner of the second prize. The dog beaten in this heat shall compete with the best of those previously beaten by the second prize winner, and the winner shall be third in the race. The discretion is given the judges of deciding which is the best of these beaten dogs in the competition for second and third places, by selection, or by running extra heats between them.

The following diagrams will illustrate the method of running:

Order of Drawing.	Wins.	Wins.	A	Wins.	Wins.
1	1	1			
2	2	2			
3	3	3			
4	4	4			
5	5	5			
6	6	6			
7	7	7			
8	8	8			
9	9	9			
10	10	10			
11	11	11			
12	12	12			
13	13	13			
14	14	14			
15	15	15			
16	16	16			

This shows 1 as the winning dog. Then take Nos. 2, 3, 4, and 5, and either run them each against the other or let the judges select the best of the three as they may deem fit—and run such best dog—who wins by selection or running, with Number 9 for second prize. If Number 5 should be the best, then 5 and 9 to compete for second, and if 5 wins, he of course takes second and 9 takes third prize, or if 9 should win he would take second and 5 takes third prize, and the best of 13, 11, and 10 to contest for third money.

The same as in first instance, but with a bye.

Order of Drawing.	Wins.	Wins.	A	Wins.	Wins.
1	1	1			
2	2	2			
3	3	3			
4	4	4			
5	5	5			
6	6	6			
7	7	7			
8	8	8			
9	9	9			
10	10	10			
11	11	11			
12	12	12			
13	13	13			
14	14	14			
15	15	15			
16	16	16			
17	17	17			
18	18	18			

Number 1 wins first prize. Numbers 2, 3, and 5, as mentioned in A, to compete with Number 9 for second. If 5 wins he takes it, and 9 captures third. If 9 wins he takes second, and 5 and 15 run off for third money.

In the All-Aged Stakes, there being a special pointer prize, the order would be as follows:

Pointers	Wins.	Wins.	A	Wins.	Wins.
1	1	1			
2	2	2			
3	3	3			
4	4	4			
5	5	5			
6	6	6			
7	7	7			
8	8	8			
9	9	9			
10	10	10			
11	11	11			
12	12	12			
13	13	13			
14	14	14			
15	15	15			
16	16	16			
17	17	17			
18	18	18			
19	19	19			
20	20	20			
21	21	21			
22	22	22			
23	23	23			
24	24	24			

As will be seen, the fourth series in pointer class decides where the special pointer prize is to go, after which the winner competes with such stakes as have also won their fourth heats, viz., Nos. 9 and 21. A bye, as is seen, is run off in its own class.

If No. 1 wins first, as sketched out above, then Nos. 2, 3, 5, 9 and 21 run for second prize. If No. 21 wins first money, then Nos. 1, 17, 22 and 23 compete for second.

If, in the first case, the winners would be different, and should be placed among the pointers, the following should explain the positions taken:

Pointers	Wins.	Wins.	A	Wins.	Wins.
1	1	1			
2	2	2			
3	3	3			
4	4	4			
5	5	5			
6	6	6			
7	7	7			
8	8	8			
9	9	9			
10	10	10			
11	11	11			
12	12	12			
13	13	13			
14	14	14			
15	15	15			
16	16	16			
17	17	17			
18	18	18			
19	19	19			
20	20	20			
21	21	21			
22	22	22			
23	23	23			
24	24	24			

Rule 21.—The judges shall order up the dogs as soon as they have determined which is the best according to the scale of points in Rule 23. Unless a dog shows such a lack of merit that in the opinion of the judges he cannot be placed, all dogs shall, if the permit, have at least two chances to show their behavior on birds. Both dogs of a brace may be ordered up by the judges for want of merit.

Rule 22.—Pointing fur, feather or reptile, if the judges deem the same excusable, shall not be considered false point, and without any eucou agreement from his handler, shall not be penalized.

Rule 23.—Maximum points of merit: Pointing, nose and standstill, 40; pace, quartering and style, 20; retrieving, 10; backing, 10; obedience and disposition, 10; total, 100. Points of demerit: False pointing, 1 to 7; breaking, in 3 for each of

fence; breaking shot, 5 for each offense; chasing, or breaking shot and chasing, 10; the second offense of a willful chase loses the dog.

False Pointing.—The judges shall give a dog ample opportunity to discover if he is on a true point, and the penalty shall range from 1 to 7 for his acts throughout the heat.

Breaking Shot.—Is when the dog, through imperfect breaking, or from excitement, leaves his proper position when the birds rise, whether the gun is fired or not, and starts to break shot or chase, but stops within a few feet from where he started, of his own accord or by command.

Breaking Shot.—Is where a dog runs in, whether a shot is fired or not, with the intention of getting to the bird, and does not stop promptly at command.

Chasing.—Is where a dog follows the birds, either when a gun is fired or not, to any extent, to be beyond the control of his handler for the time being.

Rule 24.—No person other than the judge or judges, attendants or reporters, will be permitted to accompany the handlers of dogs competing in any act, excepting owners of such dogs running in charge of a handler or deputy, and they shall be permitted to accompany the stewards until the finish of such heat, when they shall retire until their dogs again come in competition. Two persons are strictly prohibited from working one dog. If from any cause the handler of a running dog is disabled to such an extent he cannot shoot, upon his request to the judge or judges he may select some disinterested person to shoot for him; and it shall be required in all cases of handlers running dogs to go through minutely the evolution of shooting either a blank or shot cartridge over every established point, at the option of the judge or judges, upon being ordered to flush and raising a bird. The handlers of the two dogs shall go together, as if it were a brace of dogs, so that the dogs shall be upon an equality as to ground, opportunities for finding, etc. No spectators will be allowed nearer the handlers of dogs running than seventy-five yards to the rear. No person shall make any remarks about the judges or dogs in hearing of the judge; such person so offending shall be expelled from the grounds. Should any handler of dogs annoy the judges after having been ordered to retire, he shall be considered as being in handling up and out of the stake, unless his owner can continue running such dog, which may be allowed at the discretion of the Club. The privilege is granted handlers to ask the judges for information or explanation that has a direct bearing upon any point at issue, pending such questions the dogs shall not be under judgment. Dogs afflicted with any contagious disease, or bitches in season, will not be permitted on the grounds.

Following is a list of officers for 1888: President, Elliot Smith; Vice-Presidents, Henry J. Aten, James H. Goodsell; Treasurer and Secretary, Washington A. Coster; Board of Governors, S. Fleet Spier, Robert C. Cornell, Justus W. Lengerke, Jr., Otto Donner, H. E. Hamilton, C. Godfrey, George T. Leach, Charles H. Raymond, John G. Heckscher, J. E. I. Grainger, George De F. Grant, George R. Watkins.

BIG LITTERS.—East Saginaw, Mich.—My Gordon setter bitch Betty had thirteen pups last Sunday night. Did you ever hear of such a big litter? W. B. BRASSER. [By consulting Kennel Notes in Forest and Stream our correspondent will often find accounts of litters as large or larger. Bridget Plunket had seventy-nine in six litters. In our issue of December 8 we will find an account of forty in two litters. In our "Kennel Notes" we have a report of the Detroit Kennel Club's Bell whelping fourteen.]

SCARLET II.—Editor Forest and Stream: It modifies the value, to the public, of the account of the judging in the recent show when, as in the ball-trotter class, Scarlet is criticized as a dog, while she is a litter. CLARENCE MURPHY. (The mistake is inexcusable. Everyone should know that Scarlet could not be a male, although the catalogue, as well as our notes, are silent upon the subject.)

MOORFIELD KENNEL.—Philadelphia, Pa., May 25.—Editor Forest and Stream: On and after June 1, 1888, Capt. Robt. H. Jex Blake will cease to be manager of the Moorfield Kennel, and will be no longer in my employ.—A. H. MOONIE. Verbum sap.

BEWARE THE DOG CATCHER.—The New York dog pound will be opened to-morrow, and the dog catchers' carts will go about the streets gathering up the dogs to be drowned. Verbum sap.

### KENNEL NOTES.

#### NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST give the following particulars of each animal:

1. Color.
2. Breed.
3. Sex.
4. Date of birth, of breeding or of death.
5. Name and residence of owner, buyer or seller.
6. Sire, with his sire and dam.
7. Dam, with her sire and dam.
8. Owner of dam.
9. Name and residence of owner, buyer or seller.
10. Owner of dam.

All names must be plainly written. Communication on one side of paper only, and signed with writer's name.

#### NAMES CLAIMED.

See instructions at head of this column.  
Ned, By Mr. Geo. N. Kent, Leicester, N. H., for red Irish setter dog, whelped Dec. 12, 1882, by Bounce (Hick Hatterick—Bridget Plunket) out of his Nell (Bob—Topsy 11).  
Red Bran, By Mr. H. W. Smith, Worcester, Mass., for fawn red greyhound dog, whelped March 11, 1883 (Doubtless—Dorothee).

#### NAMES CHANGED.

See instructions at head of this column.  
Colleen II. to Molly, Red Irish terrier bitch, whelped July 22, 1883 (Crosby—Nora), owned by Mr. Lawrence Timmons, (Red Hook, N. Y.).

#### BRED.

See instructions at head of this column.  
Litt—Engager Fred, Mr. Henry L. Cowell's (New Haven, Conn.) English setter bitch Litt (Dancer II)—Sherwood's (Conn) to Mr. E. A. Dyer, By Mr. E. A. Dyer, (Newark, N. J.)  
Cris—Crotcher, Mr. Edward Dexter's (Buzard's Bay, Mass.) pointer bitch Cris (Crotcher—Vinnie) to Mr. A. E. Godfrey's (Crotcher—Vinnie).

By Mr. L. C. Clark's (New York) pointer bitch Belle (Pike—Lily) to Mr. C. Cornell's (Massachusetts) White's (Grace), May 17.  
Romaine—Watts, Mr. Geo. T. Wall's red Irish setter bitch Romaine (Elohe—Rose) to Mr. Tobitt's (Berkeley—R. Sel), May 16.

Nellie—Chippa, Mr. George O. Goodhue's (Havre, Canada) pointer bitch Nellie to Mr. Chippa's (Cesar—Molly, April 3).  
Dot—Bump, Mr. E. C. Chippa's (Havre, Canada) liver and white pointer bitch Dot (Rush—Queen II.) to Mr. Robert's (Rapp).  
Hazel—Bump, Mr. E. C. Chippa's (Havre, Canada) red Irish setter bitch Hazel (Edgar—Rose) to champion.

Jack—Tark, Mr. A. Levy's (New Durham, N. J.) imported Gordon setter bitch Nell (E.K.C.S.B. 7,232) to Mr. T. F. Taylor's champion Tark, May 21.

Juno—Tark, Mr. B. Blossom's (Morristown, N. Y.) black and tan setter bitch Juno to Mr. T. F. Taylor's champion Tark, May 21.

#### WHELPS.

See instructions at head of this column.  
Jennie, Mr. Walter Gibb's (New York) Gordon setter bitch Jennie (Dr. Aten's Glen—Flirt), May 17, six (three dogs), by Duke of Louisa.

Smoke, Mr. Chas. W. Nutting's (Boston, Mass.) foxhound bitch Smoke, May 14, eleven (three dogs), by Mr. U. W. Nutting's (Boston, Mass.) foxhound bitch Belle, May 22, four (two dogs), by his Pat.

Myrtle, The Detroit Kennel Club's (Detroit, Mich.) English setter bitch Myrtle (Kirk II.) to Mr. S. S. Clark's (Detroit, Mich.) pointer bitch Sultan (A.K.R. 119).

Chas., The Detroit Kennel Club's (Detroit, Mich.) pointer bitch Chas. (A.K.R. 119).

48 & 50 MAIDEN LANE, NEW YORK

## JAS. F. MARSTERS,

# FOREST AND STREAM.

## A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY.  
Six Months, \$2.

NEW YORK, JUNE 7, 1888.

VOL. XX.—No. 19.  
Nos. 29 & 40 PARK ROW, NEW YORK.

### CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

### SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsmen throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

### ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 35 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications, Forest and Stream Publishing Co., Nos. 29 and 40 Park Row, New York City.

### CONTENTS.

**EDITORIAL.**  
The New York Fish Commission.  
The Rod was Spared.

ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

### THE NEW YORK FISH COMMISSION.

THE Governor of New York has vetoed the item in the supply bill which gave the Commissioners of Fisheries three thousand dollars additional to carry on the work at Cold Spring Harbor, Long Island, on the ground that their regular appropriation was sufficient for all purposes. We do not know from what source the Governor drew his information, nor how correct his conclusions may be; but we do know that the proposed work on Long Island is a much-needed one, and is a step in advance in the good cause. The station has only been in operation five months, and has not only a commendable exhibit of work done in the way of hatching and distributing, but also of much in the way of permanent improvements in such things as troughs, rearing-ponds and fixtures for hatching fresh-water fishes generally.

Although the public recognizes the fact that a hatchery for the salmonidae and other fluvial fishes is a necessity in the southeastern portion of the State, the facts are that the proximity to the salt water renders the Cold Spring station one of almost unlimited possibilities, especially as it is unique in this respect, and has therefore the assistance of the United States Fish Commission, with its extensive connections at home and abroad. There has been no hatchery established for salt-water fishes in America, nor in any other land, and the New York Fish Commission took the lead in trying to establish one, and they only asked for a very small sum to start the work; therefore the Governor's action in this matter is much to be regretted. The springs at this station are so elevated that they have been used to turn mills, and would easily pump salt water to a height of twenty feet or more, where it could be used for hatching codfish, and all other

fishes which are available, as at high tide the salt water comes to within a hundred yards of the old mill which is now used as a hatchery.

The United States Commission has hatched codfish to a limited extent, but has worked with the disadvantage of having no hatchery near salt water. Some were hatched at Gloucester, Mass., and turned into the harbor there, and have since been taken near the docks, where no deep-sea cod were ever seen before; and others have also been hatched in the old Arsenal at Washington, in artificial sea water. No doubt new cod grounds could be created about Long Island Sound and New York city, as well as on the south side of Long Island, by large plantings of the fish, for food is plenty there, and eggs by the tons of millions can be obtained from the live fish brought to Fulton Market. These facts show reason enough to have the work continued, and it is to be hoped that it will not be abandoned, even though the Governor did not approve of a special appropriation for this purpose. Pisciculture is a progressive industry, and its hold on the people is now so strong that it is in no danger of being turned back on account of a temporary impediment.

### OBSTACLES IN RIFLE PRACTICE.

WITH the opening of the present month, shooting will begin on many ranges under official orders from various commanders in the ranks of the National Guard. A number of States have made arrangements for the practice of the men, and considerable time and effort will be expended in securing records of the proficiency, or the want of it, on the part of the troops. Each State seems to have devised a special system of ball practice, and the result is that it is entirely impossible to make any precise comparisons. The Regular Army, too, has a system, and this seems to be a shifting one, so that during a decade past we have seen a half dozen schemes devised for securing a short cut to good marksmanship without the tedious detail of careful range practice.

With a general observance of some one plan of practice, it would be possible to so show up the failings of some of our organizations, that a feeling of emulation would spring up and good results follow; at present there is too much striking about in the dark, and the general public are left in a state of uncertainty, whether or not this banging of rifles, which goes on through each summer on our State ranges, really amounts to anything.

It was the strong point made by the advocates of rifle practice when it was introduced in the National Guard that it was then entirely possible for a member to go through a full term of service and yet never have occasion to fire off a gun. Is it quite certain, then, that this cannot be done to-day? That there are not now members of the Guard who have not had any practical experience with the rifle in the field before the targets? There are certainly many who do not go near the ranges. That this is so, may in some very rare instances be due to unavoidable obstacles, but it is too true that the army methods are sadly at fault. There is not and never has been enough aiming drill in the squad rooms. Without this, work out of doors is worse than useless, and with it the field records are sure to stand out in excellent prominence.

Progress has been made and perhaps a fair result has been secured for the amount of effort put forth thus far in the cultivation of military marksmanship. Still, there is danger that a great deal of waste labor may be expended simply because each worker in the field does not know what other directors of practice are doing. In New York changes of administration have led to changes in the personnel of the Inspector-General's office, and then naturally comes a different way of putting the Guard through its course of training. There are no definite principles guiding. There is no standard set toward which the men are expected to approach, and the result is that there is no end of the work and no way of telling how much the men have profited by it.

It would be unfair to conclude that because but twenty-nine men fitted themselves to shoot in the preliminary competitions for places on the American International team, that the interest on the subject among guardsmen is at a low ebb, or that there is not a general ability to shoot well. It is one thing to shoot for pleasure, or even in fulfillment of one's duty as a member of the Guard, and quite another to undertake the responsibilities of a place on a representative team. Neither is it just to gauge the interest or want of it by the fact that Creedmoor is not crowded by competitors at the fall meetings. Time and distance prevent any such

gathering. It would be worth the while of the Board of Directors here to arrange a programme of matches to be shot on the several local ranges throughout the country, making the conditions so simple that they could be easily understood and generally complied with.

This city is able to furnish a team of any sort of shooters, and over the several States they would find many responses to a well-put invitation for a test of ability. Such matches at off-hand shooting are going on almost every week now in a quiet way, and all that is required is for some central body to undertake the labor of directing and managing them. This can be well done from this point, and perhaps through such a series of shoots something could be done toward breaking down the barriers of localism and place-proudness which now play so prominent a part in keeping riflemen from knowing more of each other, and enjoying their sport in its best feature—that of generous rivalry.

### THE ROD WAS SPARED.

AT the recent dinner to the foreign representatives to the International Fisheries Exhibition, at Fishmongers' Hall, London, in reply to a toast, Mr. James Russell Lowell, the American Minister, said that—

"He had always been jealous of the exercise, the undue exercise, of arbitrary power, and he must confess that he knew of no exercise of arbitrary power more cruel to its victim than that which brought him to his feet when he was at loss what to say. He was in that position, but he could not help thinking there was a sort of retributive justice in it; for it happened to him several years ago, as president at the annual festival of the University of which he was a member, the magnanimous satisfaction with which he used to rise and say that they were honored with the presence of a very distinguished gentleman, (Laughter) and then he paused and saw a shudder pass through the assembly every one of course imagining himself to be the distinguished gentleman meant, the average of distinguished gentlemen in America being very high. (Renewed laughter.) They had never heard of a fish speaking, it was true. There was a tradition of St. Anthony at Padua preaching to the fishes, but now the fishes had been brought to preach to us and to instruct us. If he could only make the speech which was sure to come to his mind as he was going down the stairs when they were all going away, he should have a deal to say to them; but as it was, he thanked his Royal Highness for the kindness with which he had proposed the health of the representatives of foreign countries. The kindness he met with in this country convinced him that he represented less a foreign country than most of the ministers for foreign States there, and that he rather represented the oldest daughter of England. (Cheers.) He believed that some of the exhibits sent from his country would not be found inferior in interest to those in other departments. He held in his hand a rod, one of the exhibits from America, weighing only four ounces and a half, warranted to land a fish weighing five pounds. He wroted a great fisher, but he had exceedingly pathetic associations with the American rod. (Laughter.) He once bought one which cost him \$18, and he took it to a river and had his cast, and at last succeeded in hooking a silver trout, and brought it home in triumph, when he was told that he had caught the most valuable fish in the world, as, seeing that it measured about six inches it had cost him \$3 an inch. (Laughter.)

It is evident from this that Mr. Lowell took to fishing too late in life. A boy, or man, who never went fishing until he could amass wealth enough to buy an eighteen-dollar rod, will never become, as Mr. Lowell puts it, a great fisher. This is not the only instance on record where the rod was spared and the child spoiled, *vide* Solomon. A father who brings up his boys in ways which they do not depart from, buys his sons rods and lines at an early age, or he gives them currency of the realm sufficient for an outfit, and they forego the rod and buy cheap lines and hooks, and apply the remainder of the cash to the purchase of other necessities of boyhood, as marbles, balls, etc. A boy whose angling education had not been neglected, would never figure up that his first six-inch trout had cost three dollars an inch, because the rod had been bought for eighteen dollars. He would have swapped his fine rod for a sled, a terrier pup, and a quart or two of marbles to boot, and have gone into the swamp and cut him an alder switch for a rod and been happy. It is very evident that the American Minister to the Court of St. James has been entrapped by our English friends, who are born anglers; into talking about things that he is not familiar with, in order to lead him on to the question of the Halifax Award and the Fisheries Treaty of Washington.

We suggest to them that if they want to know about the commercial fisheries, or the ichthyology of America, that they ask Prof. Goodo or Capt. Collins. If they seek to penetrate the mysteries of fisiculture they may inquire of Mr. Earle, while Reuben Wood will tell them how the de-lusively is palmed off on the unsuspecting trout as some thing which is desirable as a lunch. We have never heard much of Solomon as an angler, but his maxim, "Spare the rod and spoil the child," shows that he thought that a boy would be ruined if he did not go fishing. We fear that the rod was spared in the case of Mr. Lowell.

## The Sportsman Tourist.

### QUIET SPORT.—VI.

BY MILLARD.

VERY early the next morning Roy was away down the outlet after a fish Uncle Phil had told him about; the one that had given the old man a fall and two, and had thereby established a reputation as a strong, gluttonous warrior. Roy recognized the spot where he made his headquarters, and opened the battle, but with no hostile demonstrations from the other side. It was a beautiful location, a splendid building site for a trout to put up a shanty, and welcome his friends with the best in the house.

Roy's flies are well delivered, yet a half dozen casts from below have accomplished nothing. Put on a scarlet rib, and now get above him, as he may rise if you throw in the contrary direction. Presto, change! a swell in the water and responsive comes the rush of a yellow belly. The fish has done its work and the rod bends into a semi-circle. Does a two-pounder cause any anxiety? Now a ten-pound trout in the hole, and out of trout but no more is a six-ounce rod with a leader fine as silk the strongest tackle in the world, and while you are hardly doubtful of the issue yet there is a chance for the trout. Skill plays the important part, while of chance there is just enough to pepper it; the rest is art. It is no child's play to land such a fish with the finest of tackle. The Irishman who played the violin "be name stringin' his fiddle in the corner of the room" with coarse, heavy and fine, but he would experience none of the pleasures vouchsafed to the master.

Don't occupy yourself with the rest of the world. Forget bonds and mortgages, and look out for your leader. Let securities and collections slide for a bit, and collect and secure your trout, for he is a customer who requires immediate waiting upon. There is no deferring his demand. Fill his goblet with the merry click of the reel, the whistle of the line as it lengthens yea and after yea, the pliant rod bending to the feat the rush, its perfect curve speaking volumes for the skill of its maker; and then, Oh sweetest music, the upward swish of that trout which has taken your fly prisoner and cannot answer it.

As you "give him the bait" to "check him in his mad career," the thrill which runs through your whole system, and your nerves are tensioned to fullest tension. Fighting for every inch of line up he comes for a peep of daylight, but he doesn't like it. A summersault, and down again he goes, this time to the bottom in search of a stone wall, against which he can butt his head and dislocate his jaw or dislodge the hook. It was a good scheme but did not work; and finally he concluded to reform and become a good-natured and charming fish that could live on forever, but you will find to contribute his beautiful carcass for the angler's delectation and his stomach's demands, so after the conditions had been agreed upon he surrendered; and Roy giving him a gentle dislocation of the neck dropped him in his creel, and waded down the stream, the pools below each rock yielding their tribute and adding to the intensity of his enjoyment. Good boy, Roy; you deserve it all for the humane and gentle way in which you took your fish and crack their necks after hauling them. Roy, as all anglers should do, kills his fish before dropping them into his creel.

One evening Uncle Phil tried to persuade Glen to go jacking with him, but as Glen had been there before he declined in favor of one of the others, and related his experience under a jack something as follows:

"Like most lovers of the woods and waters I was anxious to go jacking for deer, more perhaps to gratify curiosity than from any desire to do unlawful shooting, or from scarcity of 'nuiton' in camp; and before that curiosity was thoroughly appeased, I paid for it with a good many hours of waiting and watching, which hereafter will be devoted for sleep.

"It was on the upper stillwater of one of the branches, the east, I think, of the West Canada Creek in Hamilton county, N. Y., where I had my first boat. Giles Becraft paddled for me and did it well, carefully exploring every little put in and point; he never missed a chance whatever the gunner might do. My instructions were can fully given and well digested, and with many words of warning and encouragement I took my place in the boat.

"Now, if there is any hard work to be found in the world, it may be found in jacking for deer, for you are cramped up, and obliged to keep quiet. It was a splendid night for the business, so Giles said, no moon, no wind.

"Put out that pipe or you'll drive every deer five miles back from the water."

"We silently glide past familiar points which we fail to recognize. How ghost-like and weird looks the shore under the strange light. Now and then a frightened crane would rise with a splash, and go down in front. A hedgehog would crawl out to inspect the outfit and then take a truck seat, and then the oxen made their monotonous remarks concerning our appearance, to which we gave no heed.

"The little insects were out that night. All the little winged pests of local fame that make night hideous and uncomfortable by buzzing and biting and crawling over you, had their drawing properties of a well-prepared unadorned plaster. How they did bite, and I forced to sit there like a bump on a log, enduring it all, afraid to fight them off for fear of frightening the deer. Though I endeavored to transfer to illegal hunting some of the zeal and earnestness and patience characteristic of the angler, yet under that insect drawing light I was like a fish out of water save that I did not flop.

"But miseries and pleasures alike have their endings. It was a splendid night to come to slumbers and to sleep. No moon, no wind, no deer.

"Curiously unsatisfied must needs take me under the jack the following night. Giles had gone down to the settlements for supplies and would not return until the next day, so my angling companion was forced to serve as a packman as well as the professional, and thus ended my jacking for that year.

"The following year I went to the West Canada lakes and for three nights was under a jack with no sign of deer. Had a first-class paddler. The third night he turned the jack on a hedge hog sitting on a fallen tree. I fired and the hedge hog dropped in the water dead as Charles II.

"Well, you can shoot," says the guide. "Now, to-morrow night I'll turn the light on a deer for you. I only hunted up this hedge hog to see if you could shoot."

"Shoot! Hang me if this isn't pleasant to be kept up these nights to let you know where I could shoot or not. I might have filled you full of lead for that matter."

"However, the guide was a good fellow and meant no harm. The next night he made good his word, and we had a buck with a bullet in his head hung up in camp; and I had done with jacking unless starvation was starting me in the face and jacking was the only resource left to drive him away.

"My conclusion, after these several nights' experience, is that all the credit for killing a deer in that manner is due to skillful paddling. There is little skill required at twenty or twenty-five yards in the shooter. Buck-ague need not stand in the way. I cannot understand why one should tremble and lose control of himself at the sight of a pair of glistering eyes. No deer shooting could never be attributed to fear nor anxiety.

"But my deer-hunting nights are over unless something happens. I have not lost any deer that require searching for in that manner. You, John Henry, may have my place under the jack. Under the blankets is good enough for your trails."

Uncle Phil and Vardbrough in a buck sometime during the night. A few days ended our visit with Uncle Phil, when we returned to our first camp, and there and in the immediate neighborhood we put in our time to the best advantage. Loth to see the vanishing hours depart, we hung on to them with the grasp of a miser, and improved them to the utmost. Little trials came; little vexations were sandwiched in between the great health-giving pleasures we experienced. The little tricks we heaped away the petty annoyances we snatched with smiles; and renewed our applications of tar and oil. Wet feet and bruised limbs we welcomed in our minds, but we dry them and rub them; and then like the abbreviation on the tombstone, we let them "R. I. P."

Oh, deer, for home. Well, that's a good place when you're nowhere else to go, which reminds me of the old saying, "I'm going home, I'm going home, I'm going home," and on being asked why he did not marry her he replied, "If I were to marry her, where would I spend my evenings?"

ET COLLINGS, CIVIL, APRIL 18, 1888.

## MUSKOKA LAKES.

Editor Forest and Stream:

Noticing several articles in late issues of FOREST AND STREAM regarding the above lakes, I add my testimony in their favor. Having lived for the last year or more here in Gravenhurst, which is on the southern extremity of Muskoka Lake, I am in a position to heartily endorse all Mr. M. McCracken says regarding every log of a number of years, and on being asked why he did not marry her he replied, "If I were to marry her, where would I spend my evenings?"

The fishing is good, as I have had many opportunities of verifying; the small-mouth black bass being abundant and particularly game and well flavored. While not being able to record any extraordinary weights, I find the average runs over two pounds, with quite frequent four-pounders. The bait principally used here by our local anglers is crawfish, which proves killing at all seasons, although the fly and troll take their share. Pickerel are very plentiful, and are readily taken by the troll, minnows, frogs, etc. Mascalouze are also plentiful and are usually taken with the troll. The small streams entering the lakes afford some very good speckled trout fishing. Last week I saw a trout which kicked the beam at 12 pounds taken from a small stream a short distance from the town.

There are many desirable fishing points in the Muskoka Lake, all of which are easily reached by boat from Gravenhurst.

Perhaps one of the best, both in point of beauty and excellence of fishing, is Bala, sixteen miles up the lake. Here the waters of Muskoka Lake find an exit by two outlets within a stone's throw of each other, and each tumbling over a fall of upward of twenty feet in height. They unite a few yards below the falls and form the famed Muskoka River, which enters Georgian Bay, twenty-three miles distant. Immediately below the falls, some of the best fishing is to be had, where bass, mascalouze, pickerel and pike are to be caught. This spot is where the Rudolph Fishing Club, of Pittsburgh, Pa., camped last season. Desirable camping places can be found on most of the islands or shores. Those preferring the comforts of a hotel can be accommodated at Beauman's by Mr. Prosser, or on Lake Joseph at Rosseau, where two large hotels are located, at most reasonable rates.

About July 1 to 15 is the best time to come. The fishing season has not yet opened, owing to unusual light of water. Anglers and campers had better bring their own tackle, but every kind of camp supplies in the shape of canned goods, groceries, etc., can be had here in Gravenhurst, our merchants making it a point to keep everything in that line for the accommodation of campers. The quickest and best way to reach here is by making Toronto, one hundred and fifteen miles distant, the starting point. There take the North & Northwestern Railroad to Gravenhurst. Close connections are made here with all the boats, as the train runs right down to the wharf. The Muskoka and Nipissing Navigation Co. have a splendid line of steamers on the lake, of which the Wendak, Nipissing and Kenora (the latter being a beauty) only just launched are the finest. Anglers and tourists will find the company's officers, from the popular manager down to the deck hands, gentlemanly, obliging and ever ready to do all in their power to make them comfortable and their trip enjoyable. By advising beforehand the manager or secretary of the company, steamers can be secured to land parties at any objective camping point. In conclusion I understand that I will not need to afford my brothers of the gentle art all the information in my power, and welcome any who may call on me.

A. P. CORSELL, M.D.  
GRAVENHURST, ONT., 1888.

## HUNTING AND SWIMMING.

THREE or four of us, young men but old hunters, were smoke from our smoking moccasins circled lightly and dreamily in the air, our conversation reverted to incidents which had occurred on some of our hunting trips. Andy had related how, when crossing Lake Temisconata, in Quebec, they came upon a squirrel swimming at about half a mile from shore. The little animal must have lost his bearings, and doubtless was fatigued by his efforts to stem the wind and reach the shore. One of the party held out his paddle to him he immediately came up and jumped into the canoe. After running about the canoe for awhile, and peering into all the nooks and corners among the cargo, he perched himself upon one of the boxes, where he sat most demurely until the shore was gained, when, with a whisk of his bushy tail, he was off to regain the shelter of his native wilds. No doubt his whistling and chattering were intended for a valuable offering of thanks to the party, but the party could not, as did Hiawatha, understand the squirrel language, yet they accepted his remarks as expressions of gratitude. I hope the little chap has met with no worse friends than those hunters proved to be, and that he still contributes to the welfare and advancement of the province by plucking the cork-producing acorn. I wonder what made the little animal so tame!

"The beast, as I vainly of the plain.  
My form with indifference seen."

That much of the verse applies to his case, with the exception that the hunters were roaming over the water, but the next lines have to be changed somewhat, thus:

"He was so unimpaired with man  
His tameness was pleasing to them."

This little yarn put me in mind of a frolic some of us had one day when camped at Timber Lake, Queens county, N. B. That part of the country is a splendid natural pasture, the grass growing luxuriously round the swampy borders of the lake, and the farmers turn their cattle into the marshes and let them remain there until the fall, when they collect them and drive them to their barns to fatten them for market. We saw some of these oxen swimming over the thoroughfare, which separates the meadows from the mainland, and they kept up a continual bellowing during the transit. The next day, when we went in swimming, it was a fine sight to see a party of them wading in the actions of the oxen, and forthwith there ascended such a loving and bellowing as put the cattle standing on the bank and eyeing us in wonder, to most unqualified shame. The sight of three or four young men, with their heads thrown back and eyes wide open in imitation of the frightened cattle, and splashing and bellowing like madmen, presented such a ludicrous picture, that it was with difficulty that I could keep my head, so exalted was I with laughing.

One tale led to another, and thus I recalled a circumstance which occurred some years ago. I had a Newfoundland dog, a mere pup, but of goodly size, and one day he followed me when I went down to the river to swim. He sat on the raft and watched me while I undressed, and when I plunged in he became very excited, running up and down the bank furiously, and barking every log of a number of years, and on being asked why he did not marry her he replied, "If I were to marry her, where would I spend my evenings?"

Another member of our social meeting then related a little incident called to mind by the last mentioned facts. He was out in his canoe one fine afternoon, and among other fairer passengers was a little pet black and tan answering to the name of Ginger. Paddling up a small stream they were in the boom when a person who had been cutting a floating log was pushed aside to allow passage for the canoe. Inside the boom, caught in the angle formed with the shore, floated a quantity of chaff—buckwheat hulls, etc.—and Ginger, mistaking this unstable surface for *terra firma*, boldly leaped out of the canoe and disappeared in the twainy flood. I do not know if the little animal could swim or not, but if he had, he had certainly been at the river before, and the frantic occupants of the canoe were very much alarmed about him. However, he quickly showed his head above water and began splashing vigorously, and was secured none the worse for his involuntary baptism.

These pleasant yarns led to more important and more serious conversation about swimming, and I come now to the chief object of this paper. That every man should acquire the art of swimming is an oft-repeated assertion, and the truth thereof is in no wise diminished by the reiteration. Much has been written on this subject, and yet there are at this day thousands traveling by water and exposed to death by drowning who, if they should be by any accident placed in water over their depth, would inevitably perish. My advice to all such is that they learn the art, and I am accordingly endeavoring to acquire this useful art. But I wish, more especially to speak to all young men who for pleasure go on hunting excursions by water, in canoes or boats. Apart from the pleasure and health-giving properties of swimming, we obtain, by acquiring that art, the satisfaction of having mastered a new science, a greater store of self-reliance and confidence when on the water, a more graceful physical deportment, such as is imparted by the art of dancing, and above all, the means of preserving our own lives when in danger and the ability to rescue our less fortunate fellow beings. He who can swim ventures with impunity in his fragile birch canoe upon waters where one ignorant of the art dare not trust himself. His impunity is, in a measure, his safety. Only those who can swim and are conversant with the art of handling a canoe, can be said to have acquired the art of swimming. By the art of dancing, imparted by a contest of skill against the tossing whitecaps produced by a good stiff breeze. The occasion often arises when the hunter has to paddle all day in a heavy wind. He cannot always lie by and wait for calm weather. Exposed, as he is, to many dangers, it becomes imperative that he should be able to swim. This fact is so self-evident that I need not dilate further upon it. As for how the novice is to learn to swim the best method to pursue is to practice in company with friends who have already acquired the art. After having learnt the simple methods of swimming the various feats given in books on this subject may be attempted.

Many sad incidents of death by drowning will occur to the mind of all who read the foregoing. I may relate the unhappy fate of two young men with whom I was acquainted. These unhappy victims to the inability to swim were out on a hunting excursion, and when crossing a small pond in their canoe they were upset, and both perished miserably. They both wore belts heavily laden with cartridges, and these probably kept them from coming to the surface when once immersed, and so destroyed all chance of grasping the canoe and making a struggle for life. The part of the country where this kind of occurrence is very lonely, and they might have hung to the canoe until exhausted, and no help could have reached them. The water was not over seven feet deep, and shooled rapidly. Now, a good swimmer could undoubtedly have saved himself, either by swimming into shallow water, encumbered with his belts, or he could have held his breath under water long enough to allow of his taking off his belts. The first thought of a good swimmer on finding himself thrown into the water is to secure a full breath before going under, and to hold his breath while under. But the man who cannot swim is flurried, and of course utterly at a loss to know what to do. He is helpless, suffocated, sacrificed. The good swimmer is, under ordinary circumstances, as safe on the water as he is on land. The person who cannot swim is, under the same conditions, in imminent and constant danger of death. In contrast to the sad event just mentioned, is the experience of a person of my acquaintance who is a good swimmer. He was returning from a hunting excursion, when by some mishap his bark canoe upset, and he and all his utensils were thrown into the river. He was not very far from shore, and after swimming to land with his canoe, he undressed, and returning to the spot, dived and recovered his gun and all the other articles of value, and reached home none the worse for his accident. A person who could not swim would not be in such a position, have been drowned. As before stated, I am aware that in advising all who go upon the water to learn to swim, I merely reiterate the advice of hundreds of writers, but I know personally many who cannot swim, and I am aware that there are hundreds of young men in every large city who are ignorant of that useful art. To all such I say, let not this summer pass and leave you in criminal inability to exercise powers which have in mercy and pity been given to mankind by a wise Providence. ERRATO.

NEW BRUNSWICK.

## SUMMER SPORTS IN CANADA.

AS now is the time when the summer sporting and camping trips are generally laid out, I give herewith a short list of what are, in my opinion, the best places to visit.

Beginning on Lake Ontario, we first come to the Thousand Islands, which are, however, so well known that little need be said. For old sportsmen the islands are of course too much frequented, but there is still plenty of good bass fishing, and many a pleasant day may be spent there.

Rice Lake and the region and lakes thereabout are next in order, and as in the former case are old camping out places, and generally known to the sporting world.

On Lake Erie, the sporting grounds of Long Point and Poudeau, are still able to give a first-class day's fishing and shooting, but the best points are all under lease, and well guarded from the outside world.

I omitted to mention while talking of the Lake Ontario region, that for parties wishing a pleasant camping place with moderately good fishing, and where the modern necessities of life are all handy, the mouth of the Niagara River offers the only camping grounds. Next in order comes the fishing and shooting grounds of the River and Lake St. Clair, called "the Plains." The River St. Clair, where it enters the lake of the same name, passes for some miles through a vast swamp of reeds or rice, which swamp is intersected by shallow channels in all directions. Owing to the wet nature of the ground in the vicinity it is not the best camping ground in the world, but if one can only get a foothold plenty of good fishing and duck shooting can be secured. Parts of the flats have been leased by clubs who have erected club houses at different points.

We now come to Lake Huron, the shore of which for the first one hundred and fifty miles is, like the other lakes, devoid of interest to the sportsman, except in a small way at the mouths of the rivers.

My idea of a camping ground is a place where one can get entirely away from civilization (if such a thing is possible) without having to travel too far and under great fatigue or hardship in doing so—a place where one can get good fishing and shooting, good clear water to bathe in, where the wild fruits of the season are to be found, and above all, a place picturesque enough in itself to leave in one's mind pleasant reminiscences of the sight as well as the sports enjoyed there.

With the exception of the first place mentioned above (the Thousand Islands), the region I have traveled over does not, to my knowledge, contain one spot combining all, or nearly all, the above advantages; shooting and fishing being abundant, but the character of the land, generally reedy and swampy, precludes the quieter pleasures of camping out.

One hundred and forty miles northward from where Lake Huron enters the St. Clair River, and about twenty miles above Southampton (or, as it was formerly and more properly called, Langton), the coast-line changes from that straight shore appearance with a few openings, which it has borne from the foot of Lake Ontario, and again assumes the character it wears at the Thousand Islands.

From Chiet's Point, some fifteen miles above Langton, the coast line to Cape Hurd, some sixty miles distant, is cut up with bays and coves in all directions, and the Fishing Islands run along it for some twenty miles. The shore is low, rocky and covered with reeds. There is plenty of bass, pike, and pickerel fishing in the bottoms of the bays, and capital trolling ground inside the islands for both sail and row boats. Also good duck, bear and deer shooting in the fall.

This region, however, lacks two of the main requisites for a complete camping ground, namely, picturesqueness and a supply of wild fruits. From Langton to Cape Hurd one can see the rugged, rocky mountains. At Cape Hurd, the entrance to the greatest and grandest of all fresh water bays—the Georgian Bay. This bay contains within itself all the requisites of a perfect camping ground that I have mentioned, and, as far as my experience goes, is the only place that does so.

The scenery as one enters the bay from Lake Huron by the Cape Hurd channel, is a fit introduction to strangers. The bay is of the Flower, Cove Island, Bear's Kump and the other islands of the group is really grand. Just around

the cape is Tober Moray, the finest natural harbor on the lakes; nearly a mile long and a quarter of a mile broad, each of access, deep water all over, with banks of rock to which a vessel can tie and ride as if at a dock.

The fishing in this neighborhood is good. Bass in large quantities and pike and pickerel in the bays and coves, and tip-top trolling for salmon trout on the shoals, as many as ten or twelve boats ranging from five to twenty pounders being sometimes taken in one afternoon.

However, we must fish still further to the famous "North Shore." Talk about "The Thousand Islands," why for a stretch of 200 miles from Collingwood to the Bruce mines at the entrance of the St. Mary's River, the islands on the coast are simply innumerable. A man once started to count them, but when he got to seven thousand had to give the contract up as hopeless. One can take a steamer at Millard City drawing ten feet of water and journey by a protected passage inside the islands for 100 miles or more and then only get a glimpse of the beauties of this region. The islands around here are all rock and very picturesque indeed. On almost every island one can turn around after partaking of the substantial of a meal and pick a cupful of wild raspberries, strawberries, huckleberries, currants, blackberries, and in the fall cranberries *ad lib.* without moving from your camping ground. You are within reach of the finest bass, pike and pickerel fishing to be had on the continent, and you can get the best of almost any other fish taken. However, these fish, like the salmon trout, generally prefer deep water in the hot weather. An occasional marsh at the bottom of some of the bays makes duck shooting prime. Bears are also to be met with, and plenty of deer on the mainland.

This region is very easy of access, the Northern from Toronto or Hamilton landing you at Henegawishcane, and the Midland from Toronto or Port Hope taking you to "Midland City," both places being at the southeastern end of the "north shore" chain of islands. Guides and boats can be procured at either place for moderate sums, say one man and a 25-foot sailboat for \$1.50 or \$2.00 per day, and in an hour or two you can be camped in a spot where you can live for a month without seeing anyone, except perhaps a solitary Indian in search of game.

I spent a month in the Muskoka region canoeing and portaging, and I cannot speak too highly of the trout fishing and deer shooting in the early spring and winter, but the difficulty and expense of reaching the good grounds makes it beyond the reach of ordinary camping parties, especially as in pleasant camping weather deer shooting is out of season, and the trout lie too low to be tempted with the fly.

I spent parts of one or two seasons on Lake Superior, but as that region is as yet far ahead of the present wants of the campers-out, I will not say anything more than that fishing and shooting of all kinds are good.

For the past ten years or so I have generally made one of a small party camping out or fishing for a month or two. We generally used sailboats, from twenty to thirty feet long to convey ourselves and stores, but as this necessitated pitching tents and a great deal of trouble loading and unloading the boats, we determined to get a boat large enough to hold us all comfortably and safely.

Last winter I purchased and had fitted out anew the class "A" schooner yacht Explorer. This large yacht is some 60 feet over all, 16 feet beam, and 6 feet depth of hold, has a forecabin for the crew and a large poop cabin with six bunks, and there is room for thirty more large bunks below decks. She carries foresail, mainsail, staysail, jib, jibtopsail, and main and foregigtopsails, and has a large royal yawl capable of carrying fourteen or fifteen people. She can be used for cruising up and down the coast, or cruising in the season, and as they are not wealthy men will, during the balance of the season, be open for charter to any party desiring her on any of the lakes (American or Canadian sides) at a charge of \$1 per diem each. She can call for parties at any port desired. E. LEWIS.

GOVERNOR, CANADA.

## Natural History.

### A NATURALIST IN WASHINGTON TERRITORY.

TO the ardent sportsman or more patient naturalist, Washington Territory presents the prospect of an equally unequalled in this country, perhaps in the world. Her magnificent rivers and grand old forests, her mountain peaks and beautiful valleys, are a source of wonder and admiration to whoever beholds them. It was my privilege to make one of a party to explore this wonderful region during the summer of '82, and the pleasure I derived from it forms one of the pleasantest recollections of my life, while the many rare birds and eggs which I obtained, and the curious habits noted of those of which little is known, has well repaid me for many hardships and privations.

About forty miles north of the Columbia River there empties into the Pacific a large body of water known as "Gray's Harbor." It is a fine bay, being about twenty miles long and fifteen broad, and with the numerous large rivers that empty into it, drains a wide section of country. It was through this section that I spent nearly a year collecting.

The channel of the harbor is broad and deep, and dividing several miles from its entrance, forms the north and south channels, the whole center, as well as the sides, being immense flats covered by the tides. These flats are the chosen resort of thousands of aquatic birds, and gulls, terns, pelicans, cormorants and hosts of smaller birds literally cover the sands, and when disturbed rise in a perfect cloud, their shrill cries being audible for miles. Here they have congregated from time immemorial to rear their young among the adjoining rocks and marshes, undisturbed by sportsman or collector.

One afternoon after a long walk over these flats in search of new specimens, but without success, I crossed the south channel in my *kumia* (Indian canoe) and landed on the main shore. Sitting down on an old log to rest I heard a peculiar whistle, and turning around, observed half a dozen birds, which had evidently been watching me, and I was soon recognized them as the somewhat rare black turnstone (*Sterna melanogaster*), not a single specimen of which I had as yet obtained. They did not seem to notice me, and I watched their graceful movements and the curious way they would scrutinize the pieces of kelp and shells that lined the beach, and then, if everything seemed satisfactory, turn them over. Woe to the unfortunate insect that had concealed itself there, for it was gobbled up in "the twink-

ling of an eye." While thus busily engaged, a large hawk came sailing past, and frightened them before I could secure my gun from the canoe. To say that I was disappointed would but feebly express my feelings, and as I watched them gradually fade from my sight, I determined to follow at all hazards, so I shoved the canoe in again, and after a hard paddle of about two miles, landed on the flat once more. Hundreds of birds were to be seen in every direction, but no turnstones, so I started down the edge of the water dragging my canoe after me. I soon discovered the objects of my search quietly feeding among a large flock of red-breasted snipe, but they had no notion of letting me get within shot, my repeated efforts to do so only causing them to fly greater distances.

The tide had now turned, and was fast creeping up over the flat, and having ceased to drag my canoe, it was now almost out of sight. At extreme high tides the water, I knew, would reach a depth of six or eight feet, and whenever I was to do must be done quickly, so I tried to catch a shot at long range, and had the satisfaction of seeing one bird left struggling on the sand. I hastened forward to secure my prize, but before I could reach it a large gull (*L. occidentalis*) suddenly swooped down and seizing the still struggling bird in its bill, flew off with it in triumph. I recovered sufficiently from astonishment to send a parting shot after it, but without effect.

The habits of this variety of *L. occidentalis* are somewhat peculiar. If undisturbed they will sit or circle around for hours near our camp, and the moment we would leave they would gather by the dozens, and amid a perfect chorus of screams, would carry off bread, crackers, and even large pieces of meat. Although I had specimens ready to be skinned, and others drying in the air, they never seemed to molest them, and I could not account for it at that time. I have since lost many a valuable specimen in this way. I have also seen these birds pursuing the smaller species of *Limicola*, and especially the surf-bird (*Aphriza virgata*), with the persistence of the pigeon hawk, never for a moment slackening their speed, until the frightened bird fell an easy prey to their capacity, and was carried off in their bill.

I now bent a hasty retreat, and received a thorough wetting before I could secure my canoe, which was now anchored several hundred feet from the shore, and returned to camp without having secured one new specimen.

In conversation with the Indians of this section (Chinooks) they have told me of some very large birds that at long intervals of time visited the harbor. From the closest questioning I concluded that they could be no less than the great wandering albatross (*D. exulans*), the occurrence of which on our coast has been considered as doubtful. I always kept the closest watch for these birds, and one day in September, while pursuing a motley southern storm, I observed, among a large company of Bonaparte's gulls—four birds that quickly attracted my attention; their peculiar manner of flight immediately proclaimed them as albatrosses, and from their great expanse of wing they could be nothing less than *D. exulans*. Hastily seizing my gun and shell belt, I rushed to the beach and was quickly paddling my light canoe in their direction. They were fully a mile from me, and notwithstanding my utmost efforts to get within shot, they would not deign to turn their heads toward me, while I returned disconsolate, not being fully satisfied as to their identity.

Some weeks after this, while walking on the ocean beach, I discovered a large bird partially buried in the sand. It was very much decomposed, and I had some difficulty in getting it stretched out on the beach. There could be no question in regard to its identity, it was a *D. exulans* of the variety which I had been hunting for so long. Whether it had met its death on or near our coast, or drifted from some southern sea, I could only conjecture. It was too far gone for a specimen, so I contented myself with securing the skull, which is now in my possession. These are the only instances of its coming under my observation, but I am now satisfied that it does occasionally visit our coasts.

It is interesting birds of this section are one of its most interesting features. You see them everywhere—in the open glades of the forest, or its darker recesses, out on the bare sands of the ocean beach, and even far out to sea, the whirr of their wings is heard, or their tiny forms are seen for an instant as they dart away. The rufous-backed (*Stelophorus rufus*), and the caliope (*Stellula caliope*), are the most abundant, although we occasionally secured specimens of several other varieties, and numerous nests and eggs. The nest of the rufous-backed species is a tiny affair, constructed from all that have ever come under my observation in being made entirely of bright green moss. It is almost invariably placed at the extreme end of some low branching tree or sapling, and so perfectly does it correspond with the leaves, that it is almost impossible to discover it. These little birds have all the pugnacity of our Eastern representative of the group, and attack birds of ten times their size, driving them away by the violent violence of their bills.

I will close this article by a short account of the habits of the brown pelican (*Pelecanus fusces*), which was a source of much amusement to us. They frequented the harbor in great numbers. Every morning we would see them in companies of from twenty-five to one hundred coming in from the ocean, and at dusk as regularly returning again. One company of about twenty invariably alighted on a point of sand about a mile distant from our camp, where their singular food habits were observed. They arrived there with alacrity, concealing themselves one morning before their arrival in a convenient thicket, we watched them without being ourselves seen. They were all young birds with a single exception, and he was a white-headed old chap who evidently prided himself not a little on his looks. They arranged themselves in a row with the regularity of soldiers, and then the old fellow walked up and down in front of them, and heeding them, and to spare himself to their heads. They all marched into the water and swam off to commence their regular avocations of fishing. Here again it was laughable to watch them. They would sail along a few feet above the water, each bird being attended by about a dozen white-headed gulls (*L. belcheri*). The moment the fish was seen, down would go the ponderous head, and the bird, with wings half closed, would strike the water with a splash that could be heard for a long distance. This was the opportunity for which the gulls had been waiting, and the moment the poor bird came to the surface, they surrounded him like a swarm of bees, alighting on his back, flapping their wings in his face and otherwise so troubling him that he was frequently unable to elevate his head, without doing which a pelican cannot swallow, and in self-defense would drop the fish, which was immediately carried off by his persecutors.

KALKREUTH.

## WHEN THE BIRDS RETURN.

## Editor Forest and Stream:

It may interest some of the many readers of your natural history columns to know just when our friends, the birds, return to their nesting haunts, or pause with us on their way further northward. The following list has been taken with care, and is reliable for this locality. In most cases one bird only would be noticed the first day, the following one the variety would be common.

Robin— <i>M. rubra migratoria</i> .....	March 3
Purple Grackle— <i>Quiscalus purpureus</i> .....	" 10
Phebe Bird— <i>Sayornis phoebe</i> .....	" 10
Red-winged Blackbird— <i>Agelaius phoeniceus</i> .....	" 10
Woodcock— <i>Philobolus minor</i> .....	" 11
Fox Sparrow— <i>Passerculus iliensis</i> .....	" 11
Cowbird— <i>Molothrus ater</i> .....	" 11
Wilson's Snipe— <i>Centrocercus urophasianus</i> .....	April 2
Night Heron— <i>Nycticorax nycticorax</i> .....	" 2
Blue Heron— <i>Ardea herodias</i> .....	" 6
Yellow-shafted Flicker— <i>Colaptes auratus</i> .....	" 6
Mourning Dove— <i>Zenaidura macroura</i> .....	" 6
Yellow-rump Warbler— <i>Dendroica coronata</i> .....	" 8
Chipping Sparrow— <i>Spizella monticola</i> .....	" 9
Red-eyed Vireo— <i>Vireo gilvus</i> .....	" 9
Field Sparrow— <i>Spizella monticola</i> .....	" 10
White-bellied Swallow— <i>Icterus sp.</i> .....	" 11
Grass Finch— <i>Parus gramineus</i> .....	" 13
Savannah Sparrow— <i>Passerculus sandwichensis</i> .....	" 14
Horned Thrush— <i>Hylocichla ustulata</i> .....	" 14
Redpoll Warbler— <i>Dendroica palmarum</i> .....	" 15
Chipping Sparrow— <i>Spizella monticola</i> .....	" 15
Black and White Creeper— <i>Mniotilta varia</i> .....	" 20
Brown Thrasher— <i>Thryothorus rufus</i> .....	" 21
Swamp Sparrow— <i>Melospiza palustris</i> .....	" 21
Pine-creeping Warbler— <i>Dendroica pinus</i> .....	" 21
House Wren— <i>Troglodytes aedon</i> .....	" 25
Black-throated Green Warbler— <i>Dendroica cerulea</i> .....	" 25
Blue-headed Vireo— <i>Lanius solitarius</i> .....	" 25
Spotted Sandpiper— <i>Actitis macularia</i> .....	" 28
Barn Swallow— <i>Hirundo erythrogastra</i> .....	" 28
Chimney Swift— <i>Chlorophaga alpestris</i> .....	" 28
Kingbird— <i>Tyrannus carolinensis</i> .....	May 1
Wood Thrush— <i>Hylocichla ustulata</i> .....	" 1
Golden-crowned Thrush— <i>Sialia arctica</i> .....	" 2
Warbling Vireo— <i>Vireo gilvus</i> .....	" 4
Yellow-breasted Chat— <i>Icteria virens</i> .....	" 7
Yellow-bellied Sapsucker— <i>Prinos carolinensis</i> .....	" 7
Baltimore Oriole— <i>Icterus galbula</i> .....	" 7
Catbird— <i>Tab. socius carolinensis</i> .....	" 7
Indigo Bird— <i>Passerina cyanea</i> .....	" 7
Orchard Oriole— <i>Icterus sp.</i> .....	" 8
Chestnut-sided Warbler— <i>Dendroica pensilvanica</i> .....	" 8
Yellow-throated Vireo— <i>Lanius fluviatilis</i> .....	" 8
Whippoorwill— <i>Caprimulgus vociferus</i> .....	" 8
Black-throated Blue Warbler— <i>Dendroica cerulea</i> .....	" 8
Summer Warbler— <i>Dendroica aestiva</i> .....	" 9
Nashville Warbler— <i>Helminthophaga ruficapilla</i> .....	" 9
Maryland Yellowthroat— <i>Geothlypis trichas</i> .....	" 9
American Redstart— <i>Setophaga ruticilla</i> .....	" 9
White-eyed Vireo— <i>Vireo hodgei</i> .....	" 9
Rose-breasted Grosbeak— <i>Zamelodia ludoviciana</i> .....	" 9
Wilson's Thrush— <i>Hylocichla fuscescens</i> .....	" 9
Least Flycatcher— <i>Empidonax minimus</i> .....	" 9
Solitary Sandpiper— <i>Rhyacophilus solitarius</i> .....	" 9
Blackburnian Warbler— <i>Dendroica blackburnii</i> .....	" 9
Canadian Flycatcher— <i>Myiobites canadensis</i> .....	" 10
Bobolink— <i>Dolichopus caeruleus</i> .....	" 10
Green Heron— <i>Butorides virescens</i> .....	" 10
Blackpoll Warbler— <i>Dendroica striata</i> .....	" 11
Black and Yellow Warbler— <i>Dendroica aestiva</i> .....	" 12
Ruby-throated Hummingbird— <i>Trochilus colubris</i> .....	" 12
Black-billed Cuckoo— <i>Coccyzus erythrophthalmus</i> .....	" 12
Blue-winged Yellow Warbler— <i>Helminthophaga phaea</i> .....	" 13
Scarlet Tanager— <i>Tyrannus carolinensis</i> .....	" 14
Black-capped Yellow Warbler— <i>Myiobites pusillus</i> .....	" 17
Red-eyed Vireo— <i>Vireo gilvus</i> .....	" 20
Yellow-winged Sparrow— <i>Coronatus passerinus</i> .....	" 21
Worm-eating Warbler— <i>Helminthophaga cermatophaga</i> .....	" 23
Mourning Warbler— <i>Geothlypis philadelphia</i> .....	" 27

arrived. The bluebird remains all winter. The kingfisher leaves when the streams freeze and returns with open water.

CLEVELAND, OHIO.

S. R. I.

## WINTER AND SPRING NOTES, 1892-93.

DEC. 9, 1892.—Took a rusty grackle in good plumage. It was found in a thick, bushy swamp; a spring and fall migrant.

Dec. 12.—Saw a robin feeding on some poke weed berries growing along the edge of a piece of woods. Has been seen several times since in the same vicinity.

Dec. 13.—Saw eight or ten yellow rump warblers among the cedars. They became quite numerous in a few days in the open woods and cedar thickets, until about Jan. 5, 1893, when they disappeared. Saw two song sparrows in a swampy thicket. This is a summer resident.

Dec. 20.—Saw a small flock of meadow larks in the field. The ground is covered with snow.

Jan. 1, 1893.—Pine grosbeaks here. Saw twelve or fifteen among the cedar and spruce trees, all in the gray plumage. A few are seen nearly every winter here. During the winter of 1871-72, I saw a large number of them.

Jan. 12.—Saw three bluebirds among the cedars.

Jan. 14.—Saw a golden-winged woodpecker.

Jan. 15.—A belted kingfisher shot at Mill Hollow, Pamech River, Middletown, across the Connecticut River. A summer resident.

Jan. 20.—Pine finch; shot one from among a flock of goldfinches and lesser redpoll finches; the first and only one taken here.

Feb. 5.—Saw a herring gull flying up the Connecticut River. A few usually seen about the river in fall and spring.

Feb. 9.—Saw an immense flock of lesser redpoll finches, numbering thousands; also a very large flock of Arctic snow buntings on the meadows.

Feb. 20.—A long-eared owl shot. Several barred owls have been taken in this vicinity during the winter.

March 2.—Took great Carolina wren, of which you have published an account in the FOREST AND STREAM. Saw a flock of robins and two fox sparrows. New arrivals.

March 4.—A great horned owl's nest found at Gilead, Conn., containing two fresh eggs.

March 13.—Saw crows blackbirds and redwing blackbirds. New arrivals.

March 15.—Several rusty grackles in the swamps.

March 26.—Saw three pewees.

April 1.—Large numbers of fox sparrows in the woods and swamps; more numerous than I have ever seen them before. Purple finches and cedar birds, which are usually quite numerous here during March, have not yet put in an appearance. Several flocks of wild ducks about the river. A pair of hooded mergansers, male and female, shot.

March 18.

PORTLAND, CONNECTICUT.

[The field notes given above were received long since, but have been mislaid, and only recently came to light. We regret the delay in their publication.]

CHARLES H. NEFF.

## THE ENGLISH SPARROW.

## Editor Forest and Stream:

It is with much satisfaction that we have noted the progress of the war made for the extermination of that great nuisance, the English sparrow. This bird has made his name for himself so extremely obnoxious wherever he has been introduced, that it has become positively evident that he must be got rid of, and that very soon, or he will in time drive every one of our small insectivorous native birds from our cities, villages, and thickly settled agricultural sections. And what have we in the place of our native birds? The meanest little "devil" of the feathered species that was ever created. For the English sparrow is not an insect eater, that we can discover, neither has he a song note or beautiful plumage. But he is ever ready to devour the grain of the farmer, feed upon crumbs about homes, and feast upon the offal around barns and in streets. Hence his readiness to make his home wherever there is the most of this kind of food to be had. After having satisfied his gluttonous appetite he will gather by the thousands upon house-tops, telegraph wires, fences and in idle yards valuable time that our native birds industriously devote to the work of insect hunting. He is a pugnacious little animal, ready for the combat at any moment, not only with other species of birds, but among his own family. There seems to be no good in him, and we cannot see why ornithologists, or any one else, could have the heart to defend this bird in any way. We are glad to see those who have made bird science a study taking sides against this miserable pest, and hope the legislatures of the different States will soon follow the lead and take measures to have the English sparrow exterminated from the whole country.

Here in Titusville, five years ago, the shade trees and shrubbery along the streets and about grounds, were the homes of the native wildwood songsters, and the air was filled with melodious music and even with their sweet voiced notes. Some of these summer visitors were the beautiful plumaged birds from the sunny South, who strayed North, it seemed, to make us glad with their presence; now they are all gone. Seldom one appears since the advent of the sparrow, except a few robins, a family of which is raising a young brood in the branches of a tree a few feet from our window. We do not know of the nest of another native bird in the immediate vicinity.

Hummingbirds used to be plentiful here a few years ago, and they, too, have taken flight and left the English "pirate" to have full possession.

What has been the experience here with this bird, seems to hold good over the country wherever his habits have been

noted. Hence, where there is so much evidence against, and none for, the culprit, there is certain reason for taking vigorous action in the matter. E. C. BELL.

TITUSVILLE, PA., May 23, 1893.

HANGED BY THE NECK.—Onondaga Hill, May 22, 1893.

On the 17th day of June, 1890, directly after dinner, I went out onto the front stoop of our house, and laid down on my back, looking up into the trees and sky, quietly thinking and listening to the birds above me. Suddenly I discovered a cedar bird suspended by the neck to a twig of a slight limb, and the bird twitching in the agonies of death.

Hastily climbing the tree I cut off the limb which suspended the bird and discovered that a string, or rather a fine cotton thread, had been passed through the neck and skin of the bird and twisted about it several times, and also several times around the twig. I think that the bird was hung by a pair of robins who I have seen close by. These are my reasons.

During the forenoon and a short time before dinner I noticed a pair of robins chasing a cedar bird that had one feather missing from his tail, and when I came to examine this bird I saw that there was one feather missing from his tail also. Another reason was that there were two robins chirping and making a great ado close by. I suppose it must have been over the hanging of their tormentor. Knowing the habits and nature of robins very well, I have come to believe that these two robins were the executioners.

Snipe have not been very plenty here this spring. I have heard of a couple of good bags being made, one of thirty-five snipe, another one of ten only. I saw some of them; four of them called a robin in size each. At a place on Seneca River called Mud Lock, over forty ducks and one wild goose were shot in one day. The place is but about eight miles northwest of Syracuse, N. Y. The blue jays have come back to us once more. Out of a flock of twenty-five or thirty I captured twelve and had four sent to me to mount; also nine scarlet tanagers and a few rose-breasted grosbeaks.—GREEN WING.

WOOD DUCKS IN THE BARNYARD.—Saratoga, N. Y., June 2.—In conversation this morning with Mr. D. A. Bullard, one of Schuylerville's solid citizens, the following unusual circumstance was elicited which may be of interest to your readers. A few weeks since some boys passing through one of Mr. Bullard's orchards observed a wood duck fly from a tree.

A duck in the apple tree was then unheard of, and they reported the fact to Mr. B.'s farm manager, who made an investigation and found in the decayed trunk, eight or ten feet from the ground, a nest containing eleven eggs. These were removed and placed under a hen, which in due time came proudly from the nest with eleven brownish-black ducklings. The little aborigines are exceedingly lively and shy, darting to places of concealment with the rapidity of, and on the approach of, a living thing. They regard the voice of the hen as that of a legitimate parent, and she in turn displays the usual solicitude when they bathe in the vessel placed for their convenience near the coop where the foster mother is confined. It is the intention of the gentleman mentioned to make an intelligent attempt to rear and domesticate them, with a view to matrimonial alliances with their civilized relatives.—S.

A HERON CHOKED TO DEATH.—A large blue heron was found dead a few weeks since, and upon post mortem examination it was found that his love for fishing and his "credulity" had caused his untimely demise. He had probably read some of the recent articles in FOREST AND STREAM relative to the expansive capabilities of the throats of snakes, cranes, etc., and thought all things possible. It seems that the heron had tackled a shad fully twelve inches in length, and had succeeded in swallowing about half of the fish, head foremost, when it refused to be "put down," and becoming wedged fast in the throat of the bird, caused its death. The fins prevented the disgorging of the delicate morsel. So, there he lay, a victim of scientific research and misplaced confidence. Fact! Moral—Be very careful what you write in FOREST AND STREAM, as all sportsmen and "fishermen" read it, and being "naturally credulous," may injure themselves by experiments.—A. F. R. (Belvidere, N. C., May 29).

A BEAR'S WINTER SLEEP.—Mr. James Hopper, of Edwardsburg, is the happy possessor of a year-old bear, for which he has snug quarters prepared in the shed. On the 6th of last December, his bear, no doubt feeling drowsy from his quarters, and much to the surprise of his owner, refused to be coaxed out again, even savory dishes, placed at the door of his box, had not the slightest effect upon him. Weeks passed into months, and still bruin remained in a state of lethargy, until people began to look forward to the 17th of March, when all well-regulated bears are supposed to come forth and look for food.

Bruin, for the old story, he came not forth, and it was not until the 28th of the month that he condescended to poke his brown nose out and partake of a little milk, and not until the 9th of April that he may be said to have partaken of a square meal. His long fast does not seem to have disagreed with him, as he looks just as well as ever.—Prescott (Ont.) Messenger.

THE PINE GROSBEEK'S SUMMER HOME.—I found pine grosbeaks at Second Connecticut Lake, May 24, in pairs. The song of one male I distinguished from a medley of songsters at least 300 yards away. He was perched upon a dry tree on the Caribou Bog at head of lake.—N. U.

## Camp Fire Flickerings.

"That reminds me."

DIAMOND PONDS, ten miles east of this village, are yielding some fine catch of trout, as usual with all tributaries of the Androscoggin. A camp will soon be completed there for the accommodation of sportsmen, under the auspices of Martin Noye, a new hand but a royal fellow. Last week, while in temporary quarters across the lake, he was aroused by a call from the terminus of the road, as our half awake would imagine. His loud "hello" in reply aroused one of the guests inside, who quickly recognized the voice of Bibb and exclaimed, "Come in, Mart, and let him go around here he can't swim."

A few deer had been seen on shore at the lower end of the pond. Mart, anxious to show the attractions of the locality to one of his guests, discovered, as he fondly imagined, the form of a deer partly visible through the brush, and while trying to draw attention to it the fog lifted, and it alighted in the top of a convenient tree, as big as a person's do.

COLLEENBROOK, N. H.

NED NORTON.

## Game Bag and Gun.

**GAME RESULTS.**—We are always glad to receive for publication a record of a deer or game season, and will be of correspondents favor us with such advice.

### CONCERNING BEARS.

**B**ILL asked me for a ride the other evening, and got into my cutter. It was a wild night, and the road was long, and as we drove slowly through the drifting snow, Bill lighted a cigar and congratulated himself on the fact that the wind was in our backs.

Under the influence of the weed he became communicative, and it is always a pleasure to me to find him in this mood, when I have time to listen, for he is a man of wide experience in the way, and is no ordinary character.

Bill does not call himself a hunter, but there are few beasts of the forest which he has not seen and slain. He knows the country, much of it intimately, from Denver, Colorado, to the outlet of the Great Slave Lake; has wintered on Lake Nipissing (in old muzzle-loading days), and starred in the Grand Brulee. The dog-rib Indians nearly took his scalp, but he gave them cause to remember his rifle and his gun, and no one carries a scar or two to remind him of their polite attentions.

"Bill," said I, "you've killed bears?" Of course, I knew he had, but I wished to draw him out.

"Yes," said Bill, "I have."

"How many?"

"I killed seventeen one fall."

"How many altogether?"

"About forty."

"Did you ever know a bear to kill and eat a man?"

"No, I never did."

"Ever have any trouble killing 'em?"

"No. I never had what you might call a fight with one. The worst racket I ever had was with a wild stag. He shook me up so I thought I'd never get over it."

"How was that?"

"Why, it was a rousin' big buck, Jim W.—'s got the horns now. You see, he was follerin' a doe. I shot the doe, and him with the other, and thought he was all right, but when I stepped over a log to look for him in the brush, he lit on me so quick I couldn't use my gun. He knocked it out of my hand, and then my knife, some way, and I grabbed his horns. I thought he'd never stop yankin' me round."

"How did you get clear of him?"

"I gave his horns a twist and dislocated his neck."

"That was a lucky twist."

"Yes. I had another time with a buck up on the 'Six Mile' a good deal like that, but I managed to get out a Smith & Wesson revolver I carried then, and shot him."

"Did you ever know a bear to chase a man?"

"Yes, I did—once—your own neighbors, Bill D. Me and my wife, and four or five others, was down to his house that night, and he heard a scuffle in a brush fence about twenty rods off, and thought it was a brace-steer Johnson had and went to drive it away, and he got right up to it before he saw what it was. The bear chased him clean up to the house, and he was white as a sheet when he came in."

"Do you believe a she bear, when she has cubs, will tackle a man?"

"No, I don't; not if he stands and faces her. I can give you an instance with a witness, Henry D. He was the man that come to the tree first when he heard me whistlin'."

I'd been putting up a little warehouse for a man in Kilmont and was going home just at night, with my ax and a basket of tools. When I got to the bridge I saw two porcupines, as I supposed, and started for 'em. They ran up a tree and then I saw what they were, especially as they began to squeal. Then I heard the old bear coming through the brush and had a mind to run, but I thought I might as well make a good fight as a bad retreat, and I dropped my basket and clinched my ax.

The old bear came charging up within ten or twelve feet of me and capered and snorted round, and growled and snarled fearful. Then I began whistling, and after a while Henry heard me and came where I could talk to him, and I told him what was up, and that if he'd stay there and keep the cubs up the tree, I'd go and get my gun.

He said he wouldn't stay there for a hundred dollars, and about that time my wife—my farm, joined Henry's—heard the whistling and the racket and let loose a big Spanish bound I had. Henry set on his bulldog before, but the bear took after him and back he went to the house.

"My hand came up full chisel, and meant business, and it wasn't long till he drove the bear up a tree."

"Well, the short of it was that I stayed by my tree till I got my gun, shot the cubs, and then went and got the old bear."

I spoke of an instance within my own knowledge where two men, seeing a bear near a small wood, went up to it and killed it with axes, and found that it was very old and perfectly blind.

"The fattest bear I ever killed," said Bill, "was blind as a bat. Jim Wilson had a field o' corn that they was workin' in, and one mornin' I went over to watch for 'em. I stayed to the house and talked with the old man till it got to be so late that I told him if I stayed much longer the neighbors 'd think I was after sparkin' some of his daughters, and I put out for the field. There was a stand part way down, where I watched before, and though it was dark I knew what row of corn to follow to take me right to it. Before I had got half way across the field I saw in the dim light something like a log right in the row, and I stopped. I know'd that there was no log there when I seen the place before, but there it was, and it lay perfectly still. Then I moved up a little nearer. I had one of those old English muskets, with two or three balls in it, and I took aim in the darkness and onbitted. The thing hardly stirred. I see I'd killed something, and went back to the house for a lantern. It was an old gray bear and blind as could be, and he'd been livin' on corn, I suppose, all summer, and died with the cob he was eatin' in his mouth. He was fat."

"You hadn't much trouble with him."

"No, not much. I never had what you might really call 'trouble' with 'em. I once thought I was in for it, though, and no mistake."

"Yes in Lower Canada. I'd been following a track in the early snow, and it seemed as if they—there was two of 'em, an old man and a cub—didn't know when they was goin'." I believe they did though, all the same. They

trailed me round—or I did them—hither and yon through a big swamp of several hundred acres. At last they took a beaten track toward night, and I followed 'till I came to a ledge with a hole near the bottom. It wasn't very large, and went down into the ground, or rock, and after looking the place over, I took a piece of a large dry poplar tree, and dropped it in for a plug. I thought I heard a growling, but I went on and built a fire about twelve feet from the hole. Then I took out the plug, lay down the other side the fire, where I could see the hole, and waited.

"It got dark, and I began to feel sleepy. At last I saw the head of a small bear pop up. He just took one look and settled back. Pretty soon he looked out again, and the third or fourth time he climbed out. I drew a bead on him, and knocked him over. Then I waited. In about two hours I see another head. That was a yearling, and when he finally came out, I shot him. Then I waited, and it got pretty well toward morning when I heard a grunting. I guess I must have been asked for the bear was half way out of the hole before I saw her. I jerked up my gun and let loose, and back she tumbled into the hole. Then I thought I had 'em all, and I tried to get the old one out, but couldn't do it. Then I got a torch and slid down into the hole. It branched off level, and I walked on through a sort o' cave, about eight or ten feet high, till I came near the end.

"I'd set my torch down against the side of the cave, and was lookin' round when I heard a growl, and up, on a sort of shelf to one side, I see the head of an old rouser. I up gun and fired, the torch went out, and I dropped gun, axe and all, and scrambled out of that hole, as quick's I could, I tell ye. I thought I was called for. I plugged up the hole again and started for home. I looked up a chum o' mine and we went back, and after listening awhile, went into the hole. I'd blown that bear's head half off. We got 'em out and managed to get 'em home after a while. There was lots o' people went to see the place that fall, and the next year but one there was two more bears killed in the same hole."

MICHIGAN.

### HUNTING RIFLE SIGHTS.

*Editor Forest and Stream:*

I was much interested in a communication from "Occident" which appeared in the *FOREST AND STREAM* last week. It seems to prefer the old-fashioned open sights for hunting purposes. I agree with him to a certain extent as regards using a muzzle sight only—the same as a shotgun. I have made some very good shots with a rifle using a muzzle sight only. The old-fashioned notch and bead I have discarded entirely, and I think that "Occident" would do the same if his experience were like mine. Last year I commenced using a Lyman rear sight; the more I use it the better I like it, and I think that if "Occident" will try one of them in connection with almost any front sight (I prefer the Beach) he will soon change his opinion about the best kind of rifle sights for hunting purposes, and especially for shooting moving objects.

But when aiming with a Lyman sight be sure and keep both eyes open. Don't go to "peeping and squinting" with one eye shut and the other nearly so. Don't try to use the large aperture for a peep sight, for it is not intended to be used for any such purpose; but keep both eyes open, throw up your rifle, and you will find that the eyes strike the line of sight easily and naturally. You don't have to hunt around for your front sight, then find the notch in your hind sight, and then probably take your eyes off the gun before you can see the game; but everything necessary to good, quick shooting is naturally presented, and the eye at once takes in the whole field.

I now have two of the Lyman sights in use, and I prefer them by far to any sight that I ever used or saw. I most heartily commend them, and I have had sport sufficient to satisfy me. (One of them closed) we certainly have no need of gun sights, and if we produce an aberration of vision that interferes with the organic functions of the eye by peeping and squinting, we naturally have no eyes to see straight."

IRON RAMBRO.

SOMERVILLE, MASS.

### BAY BIRD SHOOTING ON THE CHESAPEAKE.

I HAVE been putting my breech-loaders, and notably my Greener trap gun No. 10, to a severe test during the last few weeks, for I never in my life saw so many birds, especially early in the season. I have had sport sufficient to satisfy me. (One of them closed) we certainly have no need of gun sights, and if we produce an aberration of vision that interferes with the organic functions of the eye by peeping and squinting, we naturally have no eyes to see straight."

May 16, 1893.—Stopped at the Hygeia Hotel, Old Point.

May 17.—Started for the Chesapeake shore on the steamer Northampton. The wind was blowing high, the bay was rough, and the passengers as a general thing yielded up their breakfast. Reached Cherrystone, a pretentious village of many streets and avenues, but no houses; hired a darkey, a mule, and an antiquated spring wagon to carry me to Ketchum's. The animal was in the last stages of goneness, and I believed if the mule could cheat the buzzards I would make the trip sure. Reached Ketchum's in about five hours—a little grocery and a one-horse oyster and clam steamery built on piles in the bay. Captain Ketchum is a retired merchantman sailor, gun in manner, but accommodating and kind. George Hutchings carried me over to Smith Island.

May 18.—Set the decoys on the mainland shore. Much to my surprise the robin snipe have not made their appearance, but the curlew and calico-bird snipe are in abundance and stool well. Result, forty-one birds.

May 19.—Went with ox cart four miles up beach of Smith Island to Mud Hole, where Ed. Cobb, of Cobb's Island, killed two hundred birds in one day last week, but then Cobb is a put-hunter, and shoots for the New York market, and he has the thing down fine, his decoys are life-like and numerous, his patience untiring and he can whistle every bird to him for a mile around. Did not have Cobb's luck by a long sight, the spoils only amounted to thirty-two birds. No sign of the robin snipe. It is terribly hot, face and hands scarlet and burning.

May 19.—Woke up this morning and upon going to the looking-glass started back with feeling akin to the unfortunate who gazed at the prophet of Koban's countenance unveiled—skin coming off in flakes off face—nose, already large, now of double size, cheeks puffed out, eyes bloodshot, hands out and sore shoulder, bruised and black from kicking of the gun. Some would not call this fun, yet as the Cockney would say, "Wat's the bodds, long as your 'e appy." A stiff wind blowing and the birds flashing by on the

pinions of the wind. Shot until evening and the score was seventy-one birds, all killed singly and on the wing. Still no sign of the robin snipe, which have invariably hitherto stopped here on their migrations about the first of May. The old inhabitants say their absence is something unusual.

May 20.—Sunday, a day of grateful rest and ease. It has been the custom from time immemorial, both in verse, song and story, for the enamored swain to express his desire to fly to a desert isle with his fair one and live in the light of her smile evermore. It is a beautiful sentiment, but I would recommend the love-sick youth and the bashful maiden to stay for a week at some lighthouse, where the moaning of the surf sounds a requiem in one's ears.

May 21.—Again at the blinds; birds more plentiful than ever. Only stayed a couple of hours. Spoils, twenty-one. No sign still of the robin snipe.

May 22.—It is a wonder to me that some of the votaries of the rod and gun do not erect a club house on some of the uninhabited islands scattered around here, where the gunning is fine, the fish plentiful, and where one is free from mosquitoes. I know of one gem of an island in this vicinity.

May 24.—At the blinds at sunrise, and the like of the curlew I never saw before. They came from every point of the compass and in flocks. Such an exciting time don't come often. I had shot both barrels into a whirling, quivering mass, and when in a frenzy of haste tried to unlock the barrels I found they would not open. I separated the barrel from the stock and with a rod tried to force out the shell, which was a brass No. 10 with Berdan primer. In vain—the shell was stuck fast. I rammed and rammed until the rod shivered, and one half stuck in the barrel. And there I was with an empty gun, and the curlew, calico-bucks, black breast and yellow-legs, fresh from their slumbers and careless, and lighting and hovering over the decoys to hunt down, have been in many situations of trying nature in my life, but never one more aggravating and more trying. There I sat—I could not do anything else—the nearest house was two miles distant, and by the time I could walk there and get a ramrod the birds would be scattered to their feeding grounds. I became silent at last, for words were inadequate.

Break, break, break.

On thy cold gray stones, oh sea:

And I would that my tongue could utter

The thoughts that arise in me.

May 25.—The tide not being exactly right, did not go hunting. The greatest case on the island is George Hutchings, he has a most excellent fancy. The islanders say that when George wants oysters he goes to a bed and tells some of his colossus lies, and as he proceeds the oysters' mouths open wide in astonishment and then George helps himself with a fork—and old Joe Millerism—but it shows how rustic tradition hand it down.

May 26.—Last shooting day. Killed twenty-six calico backs in about two hours.

May 27.—Walking along the beach this evening found the robin snipe had arrived—they come all at once—to-morrow they will be in millions, and I have to go home to-morrow. Just my luck.

OFF THE VIRGINIA CAPES, May 28.

### FLORIDIAN EXPERIENCE.

*Editor Forest and Stream:*

"I hate the man who can travel from Dan to Beersheba and cry all is barren!" So wrote Sterne a hundred years ago, and the race of grumblers is not yet extinct. We meet them in cars and steamboats, and they utter their complaints in the newspapers. Especially do they abound among the tourists returning from Florida. One class goes there for health and amusement, and being of vacant minds, with no resources within themselves, they pass through a region full of novelties and see nothing except the poor food, the mosquitoes and the fleas. All these inconveniences are met with in the Northern States, and many of them in European traveling; but to hear these people talk, and to read their indignant letters to the newspapers, one would suppose that fried beef-steak and serratus bread were unknown in New England and the West, and that the mosquito and the flea were peculiar to Florida.

Often have we met with these unhappy people and listened to their complaints. "Florida is all a swamp." "Nothing can grow in Florida, it is nothing but sand." "I've been all over it and I know." "Where have you been?" I ask. "Oh, I've been to Enterprise, staid one night at the Brock House; then I went to the Ocala, and after that to St. Augustine. I am told it's all alike. I wouldn't give a hundred dollars for a whole county."

Then there is another class who try to pass for sportsmen. They go loaded with guns, dogs and rods. They take the great traveled routes and are surprised not to flush quail in the streets of Jacksonville, that they see no deer or turkeys about the Putnam House, in Palatka, except on Orvis's table, or find no bears in Enterprise or Sanford, except in the hotel office, perhaps.

I have seen them fishing in the St. John, Black Creek and Lake Monroe. Having no boatman who knows the waters, they come home with a few catfish or perch, swearing that there are no fish in Florida, and that the whole thing is a fraud.

The tourist who has an eye for natural scenery, or who has a special pursuit among the sciences, will always find nothing of interest in every land, and the real sportsman, who knows where to look for game and fish, and how to kill it when found, who goes into the wilderness properly equipped with guides, or to the remote lakes and rivers, or to the seashore with skillful boatmen, will find sport in Florida, and that of the best. But neither North or South will every day bring success. No one but the creature known as the "trout hog" expects or wishes to commit constant slaughter.

S. C. C.

MARIETTA, Ga.

*Editor Forest and Stream:*

I see in your issue of May 24 a letter on sport in Florida. Having spent this year some weeks wandering there in March and April, I am able to corroborate much that you say with regard to the badness of the game, the run of the Floridian hotels, and I think most people who visit Florida for winged game shooting are likely to be more or less disappointed; but on the other hand I think he is too sweeping in his condemnation of the sport to be found there.

The greater part of the Gulf Coast is still almost a terra incognita to the sportsman and the tourist, and to anyone who does not mind a moderate amount of roughing it, and

## BASS TROLLING IN FLORIDA.

MY Southern trip last winter was one of such interest and pleasure, that I am already beginning to think of the coming winter, when it can be repeated, and enjoyed even more fully, though the knowledge gained from experience during the first trip.

Although acquainted with the sport afforded by the Adirondacks, the Lake George Region, and the smaller lakes of Wisconsin and Indiana during the summer months, the novelty of trolling for black bass and of gathering violets in the month of January, with the thermometer at 80 in the shade, does not wear off with me in one trip only.

Leaving Chicago on a Tuesday night, in a through Pullman sleeper, we reached Louisville next day, noon, and from there had a pleasant ride to Montgomery, Ala. During this part of the journey we made social advances, compared notes, and became acquainted with our fellow travelers, fifteen in number, and all with through tickets for Jacksonville, some going for health, and some for pleasure.

Due in Montgomery on Thursday morning, we arrived behind time, and somewhat anxious in regard to connections, as our sleeper was to be detached there and taken on by the local trains through Georgia for Albany, Thomasville, and Waycross. Finding that our coach was left on a side track, we learned, after inquiry, that the outgoing train had been gone about five minutes. We had seen it as it pulled out from the station, but had not then realized that it was so "near and yet so far." Looking up some of the officials of the Louisville & Nashville Railroad (and finding them, by the way, to be gentlemen in every sense of the word), we received their regrets that they could not control the action of connecting roads. Learning that we could not proceed before the following morning, we made ourselves comfortable—explored the town and retired to our berths in the sleeper after a day pleasantly spent. Friday morning we were attached to the train for Albany, and started on time, and just in time to see, coming into the depot, the train from the North, with its sleeper full of passengers, who were left over there for twenty-four hours, as we had been.

Reaching Albany on Tuesday, we had the experience of being left there, and from the car windows we saw our train, that was to be, going rapidly away, over a bridge not a hundred yards distant, and under the shrill whistles from our engineer whose run ended at this place. There being no help for it, we accepted the situation, and visited the town half a mile from the little station house.

On Saturday we found the streets of the town alive with the colored men and women on all the surrounding farms who had come in on the horse-drawn, or in carts drawn by mules, and by oxen, single and in pairs. It was a periodical event, and they had all come in to visit, and to buy provisions, clothing, and needed supplies for future use. After twenty-five hours' delay, we left Albany on Saturday afternoon, not sorry that, through the peculiar, behind the age management of Georgia railroads, we had been given the opportunity of seeing much more of the country and people than we could have seen had we taken the direct route to Jacksonville on Sunday morning, and as our little company had become well acquainted and formed pleasant friendships during our five days' journey of about eleven hundred miles, it was with regret that we separated here after planning to meet again later on, at St. Augustine and points on the St. John's River.

The writer, whose trip was for pleasure, including black bass and alligators, spent the winter on the coast steamer, which starts every day during the season for the upper St. Johns, and reached Enterprise in due time. Having engaged a rowboat and its owner, who was a quiet, intelligent colored man, answering to the goodly name of Israel, we prepared for an early morning start. After breakfast, ordered over night by the host of that excellent hotel, the Brooker House, and carrying an ample lunch in the boat, Israel took the oars and rowed us down the river (nearly to the mouth of the St. Johns, flowing in from the south). The fishing here, for there was none in the lake, and using two rods, one a nine-foot bass rod and the other a longer, heavier one, which had done good service over many other waters. Forty yards of line were run off the reels, and then began the expectant waiting, so pleasant and familiar to every fisherman.

The waiting is not a long one—for one reel sings as the running line revolves it—and soon the landing net in the hand of our long line, the bass is hooked and picked. This is a beginning, but we hope for better things. Trolling now in shallow water, one line in the channel of the narrow stream, and one near the edge of rushes showing above the water, I reel in all but twenty yards of line and find, by experience, that the longer lines needed in northern waters, where the fish are more wary and shy, are not needed here, where the bass will quite frequently take the hook very near the boat. Let our hungry fellow jump for and takes the bait, just as it leaves the water near the side of the boat, while being reeled in for examination, and he is safely landed. Using two rods, one line is always in the water, and when a strike is felt upon either the other is laid down for the time, or until the fish is landed, and though there is the risk of tangled lines in the rush and efforts of the fish to escape, I willingly take the risk for the sake of increased sport.

Landing on a small island, our lunch is eaten under the shade of the palmettos, a little rifle practice indulged in with a heron, a duck or one of the myriad "blue peters" in the distance for a target, and then over nearly the same water by which we came, we slowly troll along homeward.

Occasionally a splash and a commotion in the water near by, and a glimpse of a disappearing form, tells us of an alligator disturbed in his afternoon nap, but each one plunges out of sight before I can lay down the rods and grasp the rifle in the bottom of the boat. The hotter the sun may shine, the better does this ugly reptile enjoy its heat, the sounder does he sleep on his bank or log, and the better chance does he then give for our silently approaching near enough for a shot; but it is a sport of itself, and cannot be connected with that of fishing. Meeting a friend in a boat, homeward bound, he shows a seven foot long alligator, which a ball in the head from his fifty-one-calibre Winchester has so effectually quieted that its skin can with safety be removed and taken North as a trophy.

The experience of one day is like that of another—full of sport as one can wish, and by each night my basket is filled, the usual catch being eighteen to twenty-five in number, and running from three to six pounds weight each, of large-mouth black bass, with generally one or more pickerel. One day's fishing on the banks of the St. Johns, is certainly worthy of mention here. It consisted of twenty-two black bass, of which one weighed twelve pounds, one weighed ten pounds, four were of six pounds each, and the rest of the

number were smaller, averaging about three pounds each. None of these had received a dose of shot to increase their weight, as is sometimes done in that section of country.

The best of good times must come to an end, and with regret the Brooker House is left behind and the journey northward begun, stopping at Palatka for a steamer through the Ocklawaha to the Silver Springs, then on to St. Augustine, Jacksonville, and Thomasville. After spending a little time at these more northern towns, on the fourth of the journey, home is reached. Often the thoughts go pleasantly back to the land of sandy soil, crooked rivers, oranges and last, but not least, its black bass which, though not having all the gaminess of the same fish in Northern and colder waters, yet do not fail to furnish excellent sport to the lover of the rod and line.

D. L. WHITTIER.

CHICAGO, May 28, 1893.

## BLACK BASS IN LAKE ERIE.

THE following account from the Dayton (O.) *Journal* shows that bass are plentiful in Lake Erie, and that if the fish are forbidden to be taken in Ohio waters, the citizens of that State can find them in paying numbers in Canada. Point au Pelee is near the mouth of the Detroit River, just east of Pigeon Bay. The correspondent says:

"The morning of the 23d opened with clouds, through which gray and misty palls glimpses of a brighter sky were seen, and by noon the sun, a long hidden visitor, came back to cheer the hearts and make the earth to gladden greatly and bring the lost roads to possibility again. All day long the Dayton anglers, tired of their forced rest, were on the waters, and came back with a total catch for ten rods of 283 fine black bass, the persuasive Commodore and his mate, Mr. Thompson, heading the list with 70 fish."

"The wonderfully vigorous old gentleman, Mr. V. Winters, went, however, one better, having alone caught 36. In fact the water was not fully settled after the gale."

At noon the American Eagle came in with a party of fourteen English gentlemen: Robt. Lincoln, Secretary of War; Gen. Phil Sheridan, Gen. Anson Stager, Gen. Tompkins, of Boston; Messrs. McGinnis and Elliot, of New York; Messrs. Rynson, Seeburger, Sprague and Drane, Chicago; Mr. Mills and Mr. Marshall, Sandusky; Mr. Marshall Field, Chicago; and W. Chisholm, of Cleveland, O.

"In the afternoon, with a 2:30 start, these gentlemen caught 163 bass, and both parties are out fishing for dear life to-day, and the record of May 24, 1893 (birthday of our gracious queen) will, I doubt not, be 'fishfully' celebrated on the reefs of Pelee."

"The Steinhoff runs regularly, and it is quite a comfort to be able to reach the world on every side—to Detroit one day, the next to Sandusky and the South. Up to this date for five days fishing, the Dayton party had caught exactly 1,094 black bass, no pickerel counted, and only the actual count. The respective scores are as follows: V. Winters, 164; Schultz and Bickham, 268; N. and B. Morey, 174; Best and Greulich, 300; Thompson and Cooper, 138; King, 55, or in round figures, 1,100 black bass!"—PELEE.

Following is the score of Thursday: Cooper and Thompson, 70; Schultz and Bickham, 64; Winters, 36; King, 23; Best and Greulich, 45; N. Morey and son, 45; total, 283.

In a letter to his son, Mr. E. F. Cooper, (Commodore Cooper) writes that from cold, steady weather the party were for two days diligently engaged in clearing the doctor's camp fire, but with the first bill of the storm, all hands took to the water. Mr. Thompson sent a barrel of bass home yesterday.

Mr. Greulich returned to Dayton last evening, and was bearer of dispatches. The rest of the party will continue fishing at least until next week.

The *Register* says: The Steinhoff arrived from Point au Pelee and evening at 11 o'clock with a large load of fish. The bulk of the cargo was consigned to Mr. Alvord & Co. There were, however, several boxes of black bass caught by the sportsmen.

## A TRIP TO SNAG LAKE.

THERE is probably no place in this State of any size so conveniently located to the North Woods as our beautiful city, and I doubt very much if you can find a place where there is as much fishing talked, and where there is so much talk there must be some sport, for it is not all of fishing to fish. I have often read in *FOREST AND STREAM* how such and such a one has looked up his favorite rods, reels, etc., and is preparing for a day out. I am not at all of the opinion that one should make his own rods, tents, etc., and keep them in order the year around. I find it affords me great pleasure during my spare time to devote myself to my outfit, in fact I think it quite a study to keep posted on angling, and I think more and more of your very interesting paper every copy I read. In the closet out of my office I keep everything ready for a start, even in mid-winter, if necessary, some have the fever worse than others, you know. It is a long time from September until April, and this year it was May the 15th before we dare venture out for a day.

On that night myself and Billy O., a fellow that loves the streams and lake as much myself, started for a trip of four days up the West Canada Creek. Leaving home at six o'clock P. M. night soon set in, but with light hearts, a good horse, fair roads, and a full moon, we were making good time for nearly a mile, fifty miles, remember. With plenty to eat and smoke we passed the time very pleasantly, and enjoyed the drive as much as any part of the trip, reaching our destination at 3 A. M. The next morning, without a wink of sleep, we were after those little beauties. You know that he who has sport nowadays must work for it. A sleep of two hours at guide Remondan, and an early breakfast well stored away, we were soon on a tramp up Mad Tom Mountain, all for three miles for three miles. With plenty to eat and a beautiful sheet of water, but at the present time it is private property, and therefore no fishing for us. We took the liberty to put our canvas boat together and crossed, but were severely reprimanded by Mr. Matson, the owner of the lake, for daring to trespass on his land.

Taking the trail for Indian River and tramping for a mile, the most of the way in the snow up to our knees, we came to Snag Lake, a little body of water, but well filled with trout. After being there a few moments we saw our guide appear on the other side of the lake, just returning from a trip to Twin Rock Lake. Our calculations proved correct, and by giving him the old whoop he knew us, although it had been several months since we had seen him. Sending him down to the house after the remainder of our traps we went to fishing and had fair luck for the first day. The next was Sunday and the third was Monday. With plenty to eat and I guess most fishermen will know how to get around that. Three days of fishing and then we started

Soon we were under full canvas and "walking the water like a thing of life," to use an expression which is entirely original. In due time the prow of our craft was raking across the sand of the shore, and we took the plank to enable us to get to the shady ground, where we expected to eat our noonday meal. If we were to enjoy fish we knew full well that we must catch them, and so, rigging up, we were soon engaged in a vigorous struggle for something to eat. Fortunately for us, the darkey had taken more than a dozen fine ones of the variety called here "yaller bellies," and these, with a few others, the product of our own luck, gave us an abundant supply for our dinner. The wind was from the north and unseasonably cool, and besides kept the lake in too much agitation for successful angling. To speak in plain English, the fish could not bite. Old Kinkhen K. and Old Billy Pierce, who have been frequent visitors to the lake for the last four or five years, and have caught thousands and thousands, could do nothing, and after several hours of patient effort rolled up their lines and yielded to the inevitable. The fates or the winds, or some other equally potent power, were against us, and but for the providence of our host, we should have had but a spare dinner that day. It is true, "the visiting statesmen" had a royal feast of killed fish, but then the "gentlemen in waiting" had to content themselves with less tempting, though equally excellent food. We include myself among the "visiting statesmen," but "Othello's occupation's gone" went to the lake to indulge in the luxury of fish, and nothing else would have met the demands of our appetites.

It is but just that I should remark that no offense is meant to any one by the words "visiting statesmen," which I have used. At one time they had a certain political significance, but I meant that they should express no idea, except that in our midst there was one or more who had occupied, and even now occupy, a respectable position in the country, and is known to intelligent men all over the United States and their Territories. In all my correspondence with the *FOREST AND STREAM*, whatever may be my views upon questions at issue before the country, I endeavor to maintain the status of an old darkey whom I saw many years ago at a cotton landing on the Mississippi River. It was just after a Presidential election, and the passions of the moment were being discussed, in a friendly way, certain points which had been raised during the campaign, which had just closed. When the boat landed, several of us went to the bank to get a good look at the plantation, and a little variety besides. The subject of politics was resumed on shore, and after some conversation had passed, one of the gentlemen asked the darkey what were his views upon public affairs—in other words, what were his politics, and the answer was promptly answered: "Massa, I don't know nothing 'bout them things. I belong to the Agriculture." With this digression, I resume "the thread of my discourse."

If possible, we had less success the following day. On our return home the wind had veered round to the southwest, and we anticipated "a glorious morning." But next morning it had resumed its former course; and our old friend K. K., regarding it as ominous of ill-luck, latched up his horse, and, with a goodly number of his family, went to the Swamp, a distance of about seven miles from the lake. Teccel, whose tastes do not run on the pleasures of water, much preferring those of land, being utterly disgusted, took a seat with K. K., so as to enable him to reach home that night by the E. C. Railway, on the line of which our friend lived. But we had to give it up; and so soon as we could get all things ready, spread sail, and the haven of our hopes, we should start for the lake, and, as we desired, we went. In about twenty-five minutes, we cast anchor and took to our boats, hoping to get enough for dinner. Our prudent friend, Short, whose hospitalities we were enjoying, knowing full well what "fisherman's luck" sometimes is, not only carried along some prepared victuals, as he did the day before, but had engaged the services of a piscatorial son of Ham to secure us a supply of fish, so that if we failed, we should still have a good dinner. We fished, we fished, it was well that he was so thoughtful, for any two of us could easily have eaten all we caught. The darkey had secured a respectable bunch, and that, supplemented by what we could add, gave us an abundance. I can offer no better evidence of the quality of the fish than the fact that Judge M. managed, by great effort, to dispose of four of them, while Gen. S. showed equal prandial capacity; your correspondent, of course, fully maintaining his reputation in that department of human industry.

I have visited this beautiful sheet of water on frequent occasions, and never but once had such a destruction of my hopes. At that particular time I reached the lake during what we know here as "the long season of May," and it rained so much that I did not even get a chance to "try my luck," though I stayed three or four days. When the weather is favorable, and a good sheet of water, and the fish are in those who are acquainted with the places where the fish congregate, or who are able to procure the services of a guide who is. But it is just like all other places of which I have ever seen or heard—if you fail to hit the right time, you are subjected to disappointment. We missed it. Although we got but few fish, those which we did get were delicious, and the open-hearted and handed hospitality of our host, his genial son, and a very pleasant lady who graces the coffee and of the table with various charms, made our visit one long to be remembered. Indeed, in thinking over the kindness shown us, I feel somewhat as Burrus expresses himself in the closing stanza of the "Lament of Glens, Earl of Glencairn":

"The bridegroom may forget the bride

Was made his wedding wife yestreen;

The monarch may forget the crown,

That on his head an hour has been;

The mother may forget the child

That smiles so sweetly on her knee,

But I'll remember thee, Glencairn,

And all that thou didst do for me."

The following morning at an early hour we bade our kind friends farewell, took the train for Wilmington, where we arrived in good time and in good spirits, and enjoyed breakfast which we found at the Purcell House. Owing to the schedule, we were obliged to remain at this place until 7 P. M.; but we spent the time pleasantly in "receiving" such friends as chose to call on us and enjoying their conversation. At the appointed hour we took the cars, and at half-past two A. M. the following morning were luxuriating upon the couches at my own residence. Once, the banks of the Pee Dee. My friend accompanied me, and did the kindly thing of staying a few days, when he went to gladden the hearts of the "loved ones at home."

WELLS.

for home with forty pounds of fine trout, the largest weighing 14 lbs., pretty good catch after all. We were perfectly satisfied, and, eating a good supper at Theodore's, were ready to start for home on Tuesday night at 3 P. M. with rather a heavy load, for it rained all day Monday. But with a strong horse and stomachs well filled we were on our way as happy as two clams in high water. Bill sang and once in a while I joined in on the chorus, and the night passed on, and the old horse jogged along and reached home about 4 A. M., just in time to see the boys getting out with the morning parties, and we regretted that we were too late to have any big fish stories in that edition.

Utica, N. Y., May 27.

### ANGLING IN PIKE COUNTY.

SO much has been said of late about the backward season all over the country for anglers, that I thought I would devote Decoration Day to testing the truth of such a disappointing statement. I had intended to make up a party of four rods, but two of my friends were on jury duty, and had to drop out. That enthusiastic sportsman, Mr. L. Howard, of Brooklyn, came up to me all beaming with snails and laden down with two fine fly-rods.

There were very gloomy predictions when we arrived at Milford, and old Jake Schorr shook his ten-story white hat down on us when we told him that we were bent upon killing one hundred fine trout or dying in the attempt. Jake said it could not be done with fly, and cunning Pete Hanse would have to snare them with mosquito netting. Even our good-natured host, Frank Crisman, was afraid we were on a fool's errand, but promised to fix things up to the Queen's taste.

We made an early start on Decoration Day for the Pinney farm, with two rods and each man, red bibs and black gait flaps. The Sawkill Creek was low, and the woods were pretty full of lumber. We managed to fill our creels with fifty fine trout, one-third turning the scale at over a quarter of a pound.

Our luck astonished Frank Crisman and Jake Schorr to such an extent that we determined to give the Sawkill two days' more investigation, and so secured the services of that genial young sportsman, George Pinney, who agreed to pick out all the favorite holes both on the meadow and in the brook below Gamson's farm. We put in five hours of solid work, from 6:30 A. M. to 11:30 A. M. and brought back 175 trout, 120 of which were fit to be shipped to New York the same night. Among them were five one-pound fish, fifteen half-pound and thirty that tipped the scale at four ounces.

We gave the Sawkill a parting two hours' visit this morning, and secured 100 speckled beauties that made a good twelve-pound mess. We attribute our good fortune to changing our flies to a smaller size, using cow dung, grizzly kings, queen of the water and royal coachman. The water we waded through is still chilly, but with one or two more warm days will make the trout more lively, so that, I think, on any good evening, after dark, large masses of fish could easily be secured this month, unless the indefatigable colored sportsman, Jim Peggarty, who sleeps on the banks all night, has whipped the streams to sell to strangers and what are known down here as New York city flies.

Milford, Pike County, Pa., June 1.

### SEBAGO LAND-LOCKED SALMON.

Editor Forest and Stream:

Seeing a little slip in the *Maine News* that J. Hamilton, the superintendent of the Portland & Ogdensburg Railroad Company, had landed a fifteen-pound land-locked salmon while fishing on Sebago Lake, Maine, I wrote him in order to ascertain the particulars, at the same time congratulating him on the capture of so large a fish and expressing hope that the strength exerted by him in the conflict had been fully restored to him. He wrote as follows:

"Portland, Me., May 26, 1883. Dear Sir—Your kind favor of yesterday is at hand. The salmon was a beauty; thirty and a half inches long and nine inches deep; weighed, after being out of the water three days, fifteen and a half pounds; was in fine condition. I did not use much strength in the capture, but only very light rigging; single leader, oil-silk line and an eight and a half split bamboo rod; but I did have solid enjoyment for a half hour; had it all to myself, as I was alone in the boat. I caught one the next morning of five pounds' weight and another of two and a half; and as I could only spend two days, think my luck quite fair."

The land-locked salmon of Sebago Lake are of a larger size than of all other lakes in Maine. So far as I have learned, none have been taken with a fly. I have tried that method to my satisfaction, and I learn that one of the former fish commissioners tried the fly two days without success. The smelt (a native of the lake) is the principal, if not the sole bait used. The smelt run up the Songo and Crooked rivers during the last of April to spawn, the salmon as well as speckled trout following them up for food. I may say here, in passing, that the smelt are very numerous that they are dropped up by the wind on and peddled through the towns adjoining the lake.

The land-locked salmon run up the same rivers during September to spawn. Some of the inhabitants along the banks and in the vicinity of these streams are also there with torch and spear to give the salmon a bloody reception. This, I have learned, has been their invariable custom for many years to a considerable extent. These night catches have amounted to tons during some falls, some of the fish scaling as high as twenty pounds, the fifteen pound salmon being quite common.

I am credibly informed that quite a number of individuals were detected during the past fall in this illegal fishing and indicted, a few tried and convicted. The remaining indictments are to bring over the parties for their good behavior, as it were, in the future.

I have no doubt that these spears enjoy this sport (?) with its certain results (aside from the penalties of the law) with as much zest as the visitor at the lake does by taking the fish trolling with the smelt on his flycatcher and light rod; hence the difficulty in breaking it up. The question of spearing is not, and can not be argued by those who indulge in this exterminating practice. They are fully aware of the fact. The excitement of this fishing one year and the penalty following may, through a fancied revenge (on the innocent salmon), induce a few to keep their spears bright through use.

It is generally understood, whether truthfully or not, that the Commissioners have from time to time authorized the

dipping up of the small fry of salmon and taken them to Rangeley and other lakes without attempting to keep up a supply at Sebago. This practice has made the inhabitants about the lake somewhat angry, and they therefore justify to some extent their own conduct in the matter.

The Commissioners should in some way meet these spears half way in this business elsewhere than in the courts. Sheriff observed laws are but poorly kept. The lake should be replenished with its own kind as well as with the Grand Lake fly-taking salmon. Then let the inhabitants understand that it is for their own interest more than for that of the anglers to do only the fishing in its proper season.

With a well-kept lake, the spearing banished, there would be multitudes of strangers to be provided with boats, bait, board and teams, dispensing money in liberal amounts. This lake is next in size to Moosehead, with deep, pure water, is the principal feeder of Presumpscot River; supplies the city of Portland with water, and is but about seventeen miles from Portland by Portland & Ogdensburg R. R.

Inasmuch it is optional with the Fish Commissioners upon which lakes and ponds in Maine they will bestow their favors. The Rangeley has received many favors from the board, which are greatly appreciated by all the frequenters of those enchanting and enticing waters. Were there as many influential men to solicit the attention of the Commissioners to Sebago Lake as at Rangeley, and with such liberality, these Sebago waters would soon be comparatively as rich in fish. It would afford more pleasure by far to a greater number of ardent anglers than at Rangeley. It would quell the spears without the aid of the law. It is not known generally what action the Commissioners will take in this matter, but it is hoped, so long as they have already undertaken to break up spearing by means of the law, that their good work of replenishing this delightful lake is already determined. Be it as it may, there is a considerable effort on the part of Maine, particularly the southwestern portion of its inhabitants, beginning with the Governor, who resides but seven or eight miles from it, as well as the anglers from all portions of the State, to induce the Commissioners to do the liberal thing for Sebago, and for its first business to replenish it, then I think the "spears will be beaten into pruning hooks."

Boston, Mass.

### "FISH DAY" AT WORCESTER.

SINCE the formation of the Worcester Sportsman's Club, nearly ten years ago, the annual hunt and game dinner has been the grand social event of the year; and when at the annual dinner last fall Capt. C. A. Allen in his speech suggested that the club might have a "fish day" with the same pleasurable results, the members quickly "caught on," for they saw at once that the project meant two grand dinners a year instead of one. In a previous letter I mentioned that the captains were chosen and the whole matter left in the hands of a committee consisting of Captains Allen and Benoit and Secretary Hartwell. Thursday, May 31, was selected as the day for the fishing, the dinner to be served on the evening of the following day.

It proved to be the best trout day of the season here in Worcester county, and those members who fished near home, as a rule, did the best. Messrs. Colby and Porter, however, made the big catch of the party somewhere in New Hampshire. Capt. Allen made the next best also in New Hampshire. Quite a large party went to Vermont and did next to nothing, while A. Houghton fished near home and caught the best string brought in from Worcester county. Nearly all the members fished for trout, though there were three fine strings of perch and a few pickered, these three being the only kind of fish taken.

There was a large party present at the Bay State House, Thursday evening, to witness the count, which was to close at 10 o'clock, those members who could not get there to report by telegraph before that hour. One splendid string was lost to Capt. Allen because the party could not reach a telegraph station. The count resulted in a victory for Capt. O. A. Benoit. The count followed as follows: Capt. Benoit, 12 trout, 83 points; R. L. Gilbert, 3 F. Davenport and H. E. Smith, 17 trout, 2 pickered, 130 points; A. B. F. Kinney, 26 trout, 6 points; J. M. Drennan, 14 perch, 1 pickered, 6 points; D. C. Sumner, 10 points, fish not reported; Colby and Porter, 540 points, fish not reported; A. H. Perry, 64 points, fish not reported; total, 845.

Capt. Allen's take—C. A. Allen, 18 trout, 131 points; E. T. Smith, 9 trout, 53 points; J. A. Titus, 10 trout, 50 points; Charles Hartwell, 50 points, fish not reported; A. W. Joslyn, 23 perch, 6 points; total, 296.

The dinner, which was served at the Bay State House Friday evening, was the best in the history of the club, which is saying a great deal. The members, with the invited guests, assembled in the parlors and spent an hour socially before marching to the dining hall at 9 o'clock.

Worcester, June 4, 1883.

From another account we take the following:

The dinner was served in the main dining-room, which was before presented so attractive an appearance. The hall was decorated with flags and implements used by sportsmen. Over the side-board was a glory of flags, faced with a network of fishing-rods; at the rear was another glory of flags suspended by rifles; over the tables hung glass balls, clay pigeons and fishing-rods.

#### MENU.

Oysters Served on Clay Pigeons.  
Cremers.  
Boiled Kennebec Salmon à la Hollandaise.  
Boiled Turbot à la Bay State.  
Boiled Striped Bass, Anchovy Sauce.

Mayonnaise of Lobster. Brook Trout in Aspic.  
Mayonnaise of Columbia River Salmon.  
Fried Butter Fish in Crumbs.  
Fried Pickerel, Hunter Style.  
Boiled Connecticut River Shad, Butter Sauce.  
Broiled Fresh Mackerel, Hollandaise Sauce.  
Baked Chicken, Hollandaise Sauce Supreme.  
Baked Bluefish, Stuffed, Genoise Sauce.  
Baked Stuffed Black Bass, White Sauce.

Vegetables.  
Strawberries and Cream.  
Ice.  
Charlotte Russe.  
Coffee.  
Assorted Cake.

Hon. Charles B. Pratt presided at the table. At each plate was a button-hole bouquet with a glass ball as a holder,

This, with pictorial menu and the clay pigeons for oysters, was a very unique feature of the arrangement.

At the President's table were Hon. Charles B. Platt, His Honor Mayor Hildreth, Hon. T. C. Bates, J. N. Frye, of Boston, President of the Massachusetts Fish Association; Dr. T. Noble, President of the Malden Sportsman's Club and Secretary of the Massachusetts Glass Ball Association; Alderman John R. Thayer, Col. W. S. B. Hopkins, Dr. Albert Wood and President Parker, of the Common Council.

After the dinner there were short speeches. The first was by Mayor Hildreth, who said for some time he had been trying to find out on which side he was, but he was not satisfied that he was on the winning side. He was not a fisherman like those present, but he could catch them when they came on the table. Senator Bates was full of anecdotes at the expense of his twin, the President of the evening; his stories of experiences at the State House amused the boys. Next came Gen. A. B. R. Sprague, his pairing off and the results were stated as only the General; the new recruits. Alderman Thayer made reference to the good work the club was doing to elevate the standard of sportsmen. He thought it would be an advantage if the business men would spend more time with the rod and the gun. Col. Hopkins said he always had a liking for sporting; he was not a success with the gun, but he took to fishing in his early days. He closed his remarks, like all the others, with a story.

Remarks were also made by Col. J. A. Titus, E. O. Parker, Dr. M. Earle, O. A. Benoit, C. A. Allen, Dr. Raymont, president of the club, L. G. White, E. S. Knowles, H. P. Verry, Charles S. Barton, also by Dr. Albert Wood, who in very complimentary terms referred to the arrangement of the tables, and the unique manner the hall was decorated, as well as the remarkable bill of fare. He then referred to the breaking down of the American record, the new recruits, ten is overworked, the men are breaking down at 35 and 40. To avert this, out-door sports should be encouraged; more half days should be given up to recreation, to visiting the field with the rod and the gun. Near the close of the evening remarks were made by Mr. Noble of Malden; he closed with the following sentiment:

"The Worcester Sportsman's Club—An honor to the city and the Association. We find its members always and thoroughly 'White' men, which is a 'Goodell' more than can be said of some organizations. We wish there were 'Moore' like them. With 'Hartwell' pleased, they are cordial to their 'Newcomb'—ers, each one pronouncing himself a 'Mann' or, as I might say a 'Holman' in every respect. 'Strong' men there are among them, who for the sake of the trap will take a 'Sawyer' and a 'Holt', and on a 'Day' when they are on their traps, will lay 'Low' their competitors with a 'Sweet'—ness that is refreshing. In a nutshell, they are 'Verry' good fellows, although caught 'Cutting' up now and then. Never out of temper 'Norcross,' invariably 'Hatch'—ing up something for a 'Wright' good time; winning a 'Garland' now and then to add to their wealth of trophies, and a 'Sheldon' to faithfully care for them and their guests always. 'Eager' for a contest at the traps, and when 'Holden' about night it's a 'Cole' day when they get left."

### THE UNITED STATES DISPLAY AT LONDON.

[From the London Morning Post, May 22.]

IN order to convey a definite idea of the importance of the United States department in the International Fisheries Exhibition it will, perhaps, be as well to make use of the following few statistics of the actual condition of the fishery industries in the Grand Transatlantic Republic, kindly supplied by the American Commissioner, Mr. G. Brown Goode. In 1880 the number of persons employed in the fishery industries of the United States was 131,420, of whom 101,684 were fishermen, and the remainder shoremen. The fleet of fishing boats was 6,605, augmented (since 1882) to 7,126, and 44,804 boats, now about 47,000, the capital invested being actually about \$40,900,000. The value of the fisheries of the sea, great rivers, and lakes, was placed in 1880 at \$43,046,033, and that of the minor inland waters at \$1,500,000, in all \$44,546,033. In 1888, however, the fisheries were greater than in 1880, and prices both at first hand and at wholesale were higher, so that a fair estimate at wholesale market rates would place their value at the present time rather above than below the value of \$100,000,000.

These figures will at once prove that the piscicultural trades of a country whose coasts extend from the Gulf of Mexico to the Arctic Ocean, and which contains numerous inland seas are even in their actual (by no means fully developed) condition gigantic. In 1880 the Government of the United States liberally assisted private enterprise, and by its contribution contrived to make the American display in the Berlin Fisheries Exhibition the principal feature of this highly successful enterprise. The Government then voted a sum equivalent to £200,000 for the purpose of the present exhibition, caused Congress first to vote a special grant of £10,000, and then a second of £2,500. The number of exhibitors amount to 250, and the amount of material forwarded equals, if it does not actually exceed, that of the British department. Hence, we may safely declare that this section, after our own, is the most important in the building, and it is at the same time the most interesting to the present exhibition. It is not a mere collection of cases containing miscellaneous articles, often only vaguely connected with the subject of the exhibition, i.e., fishery industries, but it is a complete and thoroughly well-thought-out and designed collection of all manner of objects illustrative of the vast marine and fresh-water fisheries of the United States. It is mainly due to the industry of our individuals that this department presents so remarkably complete an appearance. Professor Baird, United States Commissioner of Fish and Fisheries, Mr. G. Brown Goode, Mr. R. E. Earle, and Captain J. W. Collins. These gentlemen and several others connected with them have labored almost incessantly for three years past to form this collection, which is certainly worthy of their persevering hard work and of their country's reputation for enterprise. The result is that the visitor barely needs a guide or guide book in order to understand all that he beholds. There is,

for instance, a curious and most eccentric looking fishing craft; our country cousin is at a loss to make out what it is intended for. If he will take the trouble to look above he will see a photograph of this little vessel in progress of building, then a second showing its launch, yet a third illustrating its purpose when out at sea, and, finally, a series of others showing what is done with it until it returns to shore again. Perhaps it is in order better to convey to the spectators the *raison d'être* of this particular boat, to have a model of a fisherman rowing or sailing it out to sea, and lo! there he is, admirably executed in painted wood as large as life, and in the identical costume he habitually wears when in the exercise of his daily vocations. Let us study, for instance, the not over creditable history of the youthful American herring, who at an early stage in his career figures in the European fisheries under false pretences as a sardine. There are about twenty photographs showing us how he and his companions in "voluntary imposture are caught by the million off the coast of New England, and how he is "dressed" in boiling oil, done up in tin cases, and sent on his final tour of the world, with only one extenuating circumstance in his favor, and that is, that even at Nantes it would be difficult to detect his true origin, his taste being identical with that of the Crolese sardine, although if he had been allowed to grow up to maturity he would have assumed the proportions of a Yarmouth herring. In connection with the exhibits of American sardines is a series of wooden models, showing how the fish is cured and fanned for exportation, and also views of the beautiful residences of the capitalists who are making large fortunes by the industry.

In addition to the photographs, pictures and models of men, there are also a series of casts of the most remarkable fish caught in the American seas, notably curious being those illustrating the gigantic "devil fish," or *pieuvre*, rendered famous by Victor Hugo's marvelous but by no means exaggerated description of the monster in "Les Travailleurs de la Mer." One of these, the exact size of life, could not only attack and soon destroy a man, but render himself highly obnoxious to a large-sized shark. Of course the American oyster, valued principally for its edible qualities, is exhibited in a most marked manner, and especially really is, one of the chief products of the country. Its importance is emphasized by numerous canned specimens, and also by plaster casts showing the most incredible size to which the transatlantic mollusc grows. Some of the bivalves, though worthless for food, are, nevertheless, extremely valuable for the beauty and quantity of the deposit of mother-of-pearl which they shed. The utilization of this material is shown by a collection of brooches, necklaces, etc., and by one large cross surmounted by a wreath wholly composed of the glistening shells found in Florida. In this connection may be mentioned the various objects manufactured from the ivory of the whale and walrus, and the superb display of artistic articles sent by Messrs. Tiffany & Co., of New York, made out of alligator hide, tortoise-shell, and fish skins, mounted in ivory, bronze, and silver in a manner at once so remarkable and so perfect as to attract universal admiration. In order to render the department still more complete there is a certain case which will amuse as well as instruct. It contains nearly all that Jack loves most dearly. There is his not-too-much-thumbed Bible, his well-used pipe, his thread and needles, and his buttons, his "lucky" cents and shillings, and his library of "The Fisherman's Own Book," "The Cruise of the Rocket," and sundry of Marryat's works. You will hang a beloved accordion, and his improvised drummer board, and there is a genuine bundle of his "love letters," not forgetting his rather soiled pack of playing cards. In that case the visitor can study for himself all poor Jack's simple wants and domestic ambitions.

In order the better to explain the completeness with which the several fisheries are represented, the cod fishery will illustrate as well as anything else the thoroughness of the display. The geographical distribution of the cod, as well as the favorite localities of its capture, are first of all shown on a series of large maps. Then the biology and embryology is explained. The fishery of the cod is next illustrated, with models of vessels and boats employed, with actual apparatus, trawls, hauls, etc., of every conceivable kind, while the methods of the fisheries, the passage to and from the banks, the process of cleaning and curing the fish at sea, the dangers encountered—dread, all the incidents in the cod-fisherman's life are graphically illustrated by large pictures. After this come the numerous methods of curing the fish for market. For instance, a schooner lands on a Gloucester wharf her cargo of hundreds of quintals of salt codfish, which are dried, skinned, boned and pulverized, and then converted into the famous "Alder's evaporated codfish," an article of food which this exhibition will soon, probably, as greatly popularize in England as it is already in America. Numerous specimens of the fish are to be seen here, and the ladies have tasted it declare that it is without question the cheapest and best relish of its kind they have ever eaten, and the same can be said of the "boneless cod," which is delicious and known all over the interior of America, as it will doubtless be long in England.

There is also a vast collection of boat and vessel fittings, such as seine boat gear, blocks (of which a Boston firm makes a grand display), anchors, trawls, and anchors, etc. The welfare of the fisherman has not been overlooked, and the interest gains its culminating point when contemplating the collection of life-boats, fog-signals, fog-horns and other articles intended to secure the greater safety of vessels at sea. Captain Collins's most effective fog-alarm occasionally emits a by no means dulcet, but at the same time a most far-sounding howl, which certainly startles the ladies (for it is to be heard at a tremendous distance at sea as well as on shore). The exhibition of objects belonging to the United States Life Saving Service and Lighthouse Board, displayed at the extreme end of the department, is as complete as possible, and includes the original Francis patent life-car, which was first used on January 12, 1850, and was the means of rescuing 200 men, women and children from the wrecked British vessel *Yslyre*. This collection is also admirably illustrated by oil sketches and life-sized models. Close by is a cabinet which doubtless will attract ladies, since it contains an assortment of the richest sea otter and seal furs yet seen in England, and exhibited by the Alaska Seal Fur Company.

Salmon breeding and other fishculture are illustrated by a complete and historical series of the apparatus used in the preparation of fish from a comparatively early age down to the time, when they are ready for gradual progress from the beginning of fishculture in America to the present day. A series of tables has been also provided with the most improved modern appliances for hatching fish eggs. This apparatus may be classed under three heads—the "closed,"

the "trough," which requires running water, and the "floating" apparatus, the latter being a hatching box placed in a small lake. There is a large water tank, the water in which is forced through the fish-hatching appliances by means of a gas engine, so that the actual work of hatching can be carried on and studied in the presence of the visitor. Another feature is the group of models of experts in the act of procuring the eggs and laid from the salmon. One of these represents the "spawn taken" kneeling on one knee, clasping under his arm a fine female salmon, from which he is pressing the eggs with his thumb and forefinger. There are also photographs of all the American fish which have been propagated by fishculture in America, as explaining the development of the egg and the growth of the fish in the egg from day to day, followed by others explanatory of the size and condition of the fish after it has been hatched.

Other photographs illustrate the method employed in the United States of transporting young fish to various parts of that immense country. A great variety of novelties in the way of tinned, dried, and otherwise preserved fish of all kinds is shown, and among other things of interest should be mentioned Le Paze's fish glue, an adhesive which can be used for mending glass, china, and furniture, and which is said to be the strongest yet discovered. It certainly is much stronger and cheaper than either gum or any of the better known cements.

In connection with the United States Department is the U. S. Fish Commission steamer *Albatross*, of about 1,000 tons, a model of which is shown, and which will arrive in the Thames towards the middle of June. She is designed especially for deep-sea research, and is fitted with all kinds of fishing and dragging apparatus, so that she can capture anything in the sea from the thinnest to the thickest. She is under command of Captain Tanner, and forms a part of the exhibits, to which the American Commissioners intend to extend special invitation.

**SPORT IN COLORADO.**—Gunnison County.—Starting out from our cabin one beautiful morning in June, with my shotgun strapped to my back and my fishing rod in my hand, I thought I would follow up Maroon Creek, which is in Gunnison county, and have some fine sport with the trout, with which the country is so rich. Such sport I did not find. Hardly a cast but I would hook some speckled beauty and they would take almost any bait. I tried two or three different colored flies, grasshoppers, and even a piece of red flannel. It did not seem to make any difference whatever with them as to what they wanted for breakfast, so you can imagine the sport I had. After following up the creek for about two miles, I came across a large drift pile. A huge pine tree had fallen and laid across the creek from bank to bank, and driftwood coming down the creek had caught and formed a sort of waterfall, and there is where I caught some beauties; one was one of the finest specimens of salmon-trout I have ever seen. He measured 34 inches, and was a deep red color. It seemed almost a shame to eat him for he was such a beauty. About twenty yards above the drift pile a large pine tree extended across and I thought I would try a cast there; so walking out on the tree I was just about to cast when I heard a rattle of stones and sticks, and looking up the side of the ravine saw a wildcat coming down, apparently to get a drink. He trotted out on the drift pile and just as he reached the middle of the pile I let him have both barrels of my shotgun, nothing but No. 6 shot, but woe to me, for the recoil of the gun kicked me over into the creek and I got the nicest rolling over and wetting I have ever had. I got out all right, though, for it was only about three feet deep. After finishing my breakfast and looking over the cause of all this trouble, but Mister Wildcat had gone far away and left nothing but a few blood drops. I had enough for that morning, so, picking up my string of trout, I went back to my cabin and soon had a fine mess of fried trout.—PAUL SCOTT.

**THE BERTRAND ISLAND CLUB.**—A number of well known gentlemen in New York city interested in shooting and angling have recently purchased Bertrand's Island, in Lake Hopatcong, New Jersey, where they propose to build a club house. In addition to the island, which contains about twenty-three acres, a tract of shore land has also been secured. At present the membership will be restricted to fifteen, and the organization will be known as the Bertrand Island Club. It will be governed by rules similar to those of the West Jersey Game and Protective Association, and henceforth anglers out of season in the waters of the lake will be prohibited. The Club proposes to restock the lake with black bass and other game fishes. During the summer the club house will be kept open for the benefit of single members; but a number of the married clubmen propose to lease small plots of ground from the club and build cottages. The members are George B. Post, president; G. W. Campbell, Jr., vice president; J. Heron Crossman, treasurer; E. W. Nicholas, secretary, and Messrs. A. N. Martin, J. F. Cox, James Kent, Jr., J. A. Risley, B. K. Jameson, Frank Jenkins, Henry L. Pierson, Jr., and E. S. Rawick.

**WHITEFISH TAKE THE HOOK.**—BLACK BASS.—I have seen a good many articles of late upon taking whitefish with bait, etc., but have not notice of a single instance of one being taken with spoon by trolling. Once, some seven or eight years ago, I was fishing for pickerel with a spoon on Lake Cayuga, N. Y., and caught a whitefish weighing over four pounds. It was not hooked, but caught with the hook well in its mouth. Was this not a rare occurrence? First of all, the black bass fishing can be had at Niagara, Ont., at the mouth of the Niagara River. No fly-fishing, they are taken with chub and by trolling. Good folks, boats, etc. Good fly-fishing can be had later in the season at the same place for white or silver bass, which are very game, bite fast, and are taken in good numbers. As many as sixty to eighty are taken in an evening.—NIAOARA.

**PENNSYLVANIA.**—Philadelphia.—Hundreds were fishing yesterday along the Schuylkill for black bass, it being the legal opening day of the season. Up the river, near Pottsville, anglers outnumbered the fish. On the train from Reading in the early morning there was a large delegation, which was joined at Pottstown by a contingent from the latter place. All went for Yankee Dam at Limerick, or Pawling's Bridge, both considered the best places in the upper Schuylkill for bass fishing. The catch, I learn, was good. It is said that the season is backward this year, and that the sport is better than at least in the spring before the writer is tempted to join his rod for bass.—HOMO.

**A WORD ABOUT GEORGE DAWSON.**—June 2, 1883.—I do not believe in having time drag on my hands because there are no books or papers in camp. I am no book worm, but give me a hammock, a shady spot, such books as these for the first two or three days after getting into the woods, and I am happy. I think Dawson's works the purest of the kind ever written. They touch the keynote of kindred souls. They are pitched high, and must elevate the mind of the careful reader. They are deeply reverential, and will purify many a thinking mind.—NORMAN.

**MINNESOTA.**—Pillsbury, May 28.—Fishing in all the many lakes throughout this section is now excellent. Bass, wall-eyed pike and pickerel are to be had in abundance. I will gladly provide the best quarters possible, i. e., farm house accommodations, for any brethren of the angle who may wish to try our waters.—J. B. LOCKE.

**LARGE SHAD.**—A shad weighing eight pounds was on Mr. Blackford's slabs last Saturday. It came from the Connecticut River.

## Fishculture.

### "MISDIRECTED FISHCULTURE" AGAIN.

Editor Forest and Stream:

In your editorial comments upon my rejoinder published last week you express the opinion that I have done me injustice, and that I have been "interrupting progress of fishculture," whether intentionally or through mistaken notions [you] cannot say. Now, Mr. Editor, if you will state the particular facts upon which you base the opinion that I am an "obstructionist" in this matter, or whether it has been confined to the construction of "some carp ponds and making speeches before the Legislatures of Pennsylvania and New Jersey."

In the first place, you have received a copy of my humble monograph on "Carp and Carp Culture." You are aware of the same quite sharply (without offense, however, and the presumption is that you must have read it. If so, you found on page 6 a reference to Dr. Garlick and his operations of 1853, which you can judge whether my interest in fishculture has extended back twenty-eight years or whether it has been confined to the construction of "some carp ponds and making speeches before the Legislatures of Pennsylvania and New Jersey."

Never as I said before, the files of the FOREST AND STREAM for eight years past will afford some evidence upon the subject. And further, my letter files contain a somewhat prized accumulation of personal communications from the editorial department of the FOREST AND STREAM for eight years past, containing statements strangely at variance with those now emanating from same source. I know, by a little experience, that facts are sometimes developed which necessitate an editorial change of front. I, at this moment, recall a case in your own experience, and will not write: thus, thus, powdered epistle. Mr. Editor, do not hesitate to fire out your facts which will prove me to be the fishcultural sinner portrayed in both your late editorials upon the subject. It is possible that I am rendering myself open to the charge of "egotism" by asserting that I am perhaps sufficiently quoted as an authority to render it desirable for the public to know whether I am now, or have been during the past quarter of a century or more, obstructing legitimate, practical and intelligent fishculture, or whether I am, as you and other ardent anglers are apparently endeavoring to rent a little pent-up jealousy through the medium of FOREST AND STREAM.

If the mild expression, on a few occasions only, of my individual opinion, that the late New Jersey Commission did not use the State appropriations intelligently in many cases, is sufficient basis for your assertion that I have "been very hostile" to the Commission, then I will plead guilty to that count in your indictment. Certainly I have not antagonized them otherwise, and upon that count I look for acquittal. You certainly do not quote me correctly as to what I said in your office concerning my remarks before the Pennsylvania Legislature. After having referred to some of the misdirected efforts of the State's fish culturists and Commissioners, I was asked by one of the members of the Legislature the open question, if I could recommend an appropriation for the Fish Commission. I replied that if I were to answer the question, affirmatively or negatively, without qualification, my reply would be liable to misinterpretation. I then expressed my opinion the Legislature should grant a liberal appropriation for fishculture, but under proper conditions; that I had a high opinion of the Fish Commission, who ranked far above the average of State Commissioners, and could not conscientiously recommend an appropriation to be expended as heretofore; that most of the previous experiments were failures, that although these experiments were justified under the existing conditions, the Legislature should not continue expenditures by the State in the same direction. I then recommended a consolidation of the Fish Commission with the State Board of Agriculture, as stated in my last communication. This is the substance of what I said briefly in your office. I have no other explanation to offer. I am a member of the Commission of New Jersey. I replied that I only knew Mr. Jenkins of Camden, that I was not aware that he had any experience in fishculture, that he was an authority on planked salmon, and, upon that point, an expert. I was not a public prosecutor, would be likely to make it lively for wild violators of the fish laws, and would be one of the most valuable Commissioners who had held the office in New Jersey.

And now in regard to your assertion that the carp "is a poor table fish," etc. I have conversed with over twenty persons who have tested their table qualities, and most of these parties were epicures. All except one extolled their table qualities, and this one's test was of a specimen taken from a filthy pond. I am not the least bit rigorous in that regard. I have had ocular evidence of its wonderful success in numerous ponds constructed by me for several of the leading business men of Pennsylvania, New Jersey and Delaware. Nor do I antagonize the carp fishculture of other fishculture. On the other hand, I am enthusiastically in favor of continued, well-directed, and every experimental work, such as most of that performed by the United States Fish Commission; but not constant repetition of exploded follies. By exposing the latter, I am aware that I incur the hostility of those who are in the habit of repeating these follies, and I am not so stupid that I can not understand the "true inwardness" of the petty antagonists which, like one of the snappish enemies of the carp, are not the least bit rigorous in that regard. I do not think the FOREST AND STREAM is justified in its course without proper investigation, which would surely change its trend.

By reference to your editorial leader I find that I have not referred to you denials that the Delaware was an original salmon stream. I think I have referred to you more to your assertion than it will me to prove mine, though I cannot furnish as direct proof as might be required in a court of law. For several years past numerous reliable Pennsylvania farmers have published statements that the Delaware was the original records of Pennsylvania make repeated reference to the abundance of salmon in the Delaware. An aged Quaker gentleman, recently deceased, whose grandfathers were residents of Philadelphia, in his will, in which he was heard when speak of the abundance of salmon in the Delaware, was in their day. The late Thaddeus Norris assured me in 1876 that he had no doubt of the Delaware being an original salmon stream, and was well known that he was an industrious and reliable investigator of all matters relating to river fishes of

GLENCHO KENNEL'S RED IRISH SETTER BITCH "TRIX."

WINNER OF FIRST IN OPEN CLASS, NEW YORK, 1883.

America. Mr. Norris attributed their disappearance to continued fishing out of season.

I am now becoming an old man. While a mere boy I watched from the bank of a tiny green mountain brook the curious operations of a pair of trout over a bed of gravel, but could not imagine what they were up to. Doctors Garfield and Ackley were the first to enlighten me, years later. From that moment my investigations practically commenced. I have from time to time shown, had opportunities of studying the New England trout streams, now practically barren. After patient investigations I have come to the conclusion that the depletion of the larger portion of our trout and salmon streams is, in the main, due to the clearing off of the forests and the filling of the soil contiguous thereto, rendering them warm and muddy, and while these conditions exist I believe it useless to spend time and money in repeated attempts to restock them with members of the salmon family. If this constitutes me a crank, young men may see in the situation some reason for endeavoring to read me out of the fishculture ranks.

117 MARKET STREET, Philadelphia.

[We repeat that we had no intention to belittle Mr. Peirce's efforts in behalf of fishculture. The question about which we took issue with that gentleman was his reported statement that fishculture in the United States had not been successful. We believe that it has been. The matter under discussion has assumed the shape of a local dispute between Mr. Peirce and the former New Jersey Fish Commission, as to the manner in which the latter have expended the State appropriations for fishculture, and this point we may leave for them to settle among themselves. We believe that evidence is lacking to show that the Delaware was an original salmon stream, and this view is supported by the best authorities in the country.]

**FISHING BY ELECTRICITY.**—According to a correspondent of the Philadelphia Press, the electrical apparatus of Prof. Baird's expedition is very complete. The search light is one of the most novel of the wonderful inventions of the nineteenth century. It consists of three Edison electric lights of sixteen-candle power each, enclosed in a hermetically sealed glass case, which is surrounded by a glass globe, and capable of resisting the pressure of the water at a great depth. It is proposed to sink the lamp and illuminate the sea by turning on the light. This, it is expected, will attract the fish, and a net ten feet in diameter at its mouth, placed below the light, will be drawn at the proper time, and the unknown fish of the lower waters will be caught. "It is an improvement," said one of the officers of the ship, "on the method of the Indians, who searched the rivers at night time with a burning pine knot in the bow of his canoe, and a spear in his hand, but the idea is really stolen from him." Paymaster Rich has the most perfect arrangements for his work. He will be able to photograph fish and shells, as soon as they are taken out of the water, by a vertical camera. This is necessary, as in some cases the air changes the form of some of the curiosities of the sea. The sea water will be brought to the surface from any depth desired for analysis. During the trip of the Albatross from Wilmington an arc light has been first successfully operated on an Edison circuit, and an invention has been completed for lighting the surface of the sea, which will be useful for signaling, and for the prosecution of all kinds of work at night.

**THE FISHCULTURAL ASSOCIATION.**—As we go to press the American Fishcultural Association is in session in the room of the Farmer's Club, Cooper Institute, New York. The meeting will continue through Thursday, beginning at 11 A. M. As usual we will give a full report of the proceedings.

#### PUBLISHER'S DEPARTMENT.

Roundabout roads are out of favor. Short cuts are popular and practical. Besson's CAPSINE FORKES PLASTER is in this respect and all others in advance of the times. It is fast supplanting all other external remedies. It does not poison; it acts to-day. It is commended by eminent physicians. It never fails to afford immediate relief. Price 25 cents. Word "Capsine" cut in middle of the plaster.—*Advt.*

The good qualities of Greenwood's Improved Oarlock are demonstrated by the constant and increasing demand for them in city and town, and by the universal favor they receive from boatmen of experience and understanding, also in their adoption by some boat clubs to the exclusion of all others, and again by the many testimonials of their superiority received from purchasers every where.

## The Kennel.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

#### FIXTURES.

##### BRECKEN SHOWS.

June 12, 13, 14 and 15, 1888.—Chicago Bench Show, Chicago, Ill. Entries close June 1. Chas. Lincoln, Superintendent.

##### FIELD TRIALS.

November 19, 1888.—Eastern Field Trials Club, Fifth Annual Trials, at High Point, N. C. Entries for the Derby close July 1; for the Members' Stake, Nov. 17; for the All-Ages Stake, Nov. 1. W. A. Custer, Secretary, Flatbush, Long Island, N. Y.

November 29, 1888.—Robin's Island Club's second Annual Field Trials at Robin's Island, L. I., for members only. Entries close Sept. 1. A. T. Plummer, Secretary.

December, 1888.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Eryson, Secretary, Memphis, Tenn.

#### THE DOGS AT THE NEW YORK SHOW.

##### Editor Forest and Stream:

There just finished reading Mr. Stuart Taylor's letter anent the last New York show, and I feel inclined to reply to it in a few words. I entirely agree with him when he says, "There are a great many disagreeable people in this world, and the more I see and hear of this class of human beings, the better I love dogs." And it is because I do love dogs, the dogs of the present day and the very ones which Mr. Mason says "are degenerating into worthless curs" that I feel constrained to break a lance in their behalf. Mr. Taylor remarks that his standpoint may be too critical. I consider him most hypercritical—not of the managers, but where dogs and dog shows and judging is concerned. I thought so when his former letter to FOREST AND STREAM appeared, in which he said that he had attended one of our former shows and also one of the large English shows (Crystal Palace, I think it was), and, in his opinion the dogs at both places were a poor lot. Now, I am sure that his suspicion that he may be too critical is well founded.

Of all the pointers and English setters there was not one who was right in stern; in fact, they were all "faulty to a peculiar degree" as regards their "tails." I wonder if Mr. Taylor thinks it best to improve upon nature, as was done in the case of the "tails" of two of his dogs, viz., the little bull-terriers Pegasus and Kittie. It would seem unreasonable that out of one hundred pointers and nearly two hundred setters nature should not have seen fit to bestow at least one "tail" good enough for the rest of the dogs! Says Mr. Taylor: "If any lover of the pointer will point out one to me that was on exhibition that is not faulty to a peculiar degree in stern, I will make him a present of any one of my dogs he may select." I am as much a lover of the pointer as anyone, and I believe I could select pointers which were on exhibition and whose tails were all right. But I doubt if I could satisfy Mr. Taylor, and as I do not want any of his dogs I shall not make the attempt. I had only one dog at the show this year, and I know his "tail" would offend Mr. Taylor. In the ring he carries it somewhat after the manner of the foxhound, which the "excellent sportsman" confounds with the pointer, but in the field I never found cause to complain of the graceful and efficient carriage of this same scum.

I do not pretend to know all classes of dogs as well as Mr. Taylor, but I do think I have a fair knowledge of pointers and setters. I take issue with anyone, be he English or American, who belittles our sporting dogs. I have had the pleasure of attending nearly all the large shows in this country, but I have never been in England when the large shows were open; so I can only speak from hearsay about the foreign dog shows. In 1880 Mr. Hugh Deziel told me that he had no idea that our dogs, particularly the sporting classes, were so good as he found them to be, and he told me that we could beat them in the very class of dogs which they particularly affect in England, viz., the English setter. This year Mr. Herbert Inman came to me and said that he had gone critically among the dogs, and that our show was better on the whole than the great English shows which he had attended last winter. This gentleman had just returned from England and is a judge of dogs.

I know we are not far behind our English cousins in sport-

ing dogs, as is too often said by some English dog dealers, who would be our teachers and counsellors and guides for a consideration! Let us do what Mr. Stuart Taylor suggests, "improve the dog as we improve the horse, by careful breeding and judicious selection," but do not let us be discouraged because our dogs and dog shows do not meet the approval of such men as Messrs. Mason and Graham.

ROBT. C. CORNELL.

NEW YORK.

##### Editor Forest and Stream:

Mr. Stuart Taylor says in his "Notes on the New York Dog Show": "I saw no English setter there I would give one hundred dollars for in current coin. Show me just one out of all that got grouped in the examining ring that did not carry right royally a defiant curling flag," etc. He also wanted one showing with a good chest, substance and bone, etc.

Now I trust that Mr. Taylor will accept my refutation of these sweeping charges in the spirit that prompts me to answer as I will neither enter, nor do I count any controversy. I will merely say this to Mr. Taylor, in good faith and kindly spirit, in justice to my dog: That if he will take the trouble to visit me the fourth house on Linden Boulevard, Flatbush, Long Island (street cars run every five minutes), I will tender him a most courteous, hospitable and gentlemanly reception to my home, and take the utmost pleasure in proving to him that he did not scrutinize so carefully, nor is his sight so keen as he thought. For I have an orange and white field trial setter, three years old, full of as good useful substance, bone, sinew, perfect chest, and that he carries a tail "according to Hovle" always, and this same dog faced Major Taylor. This is no bid for his best dog. I don't want him. I only ask him not to condemn my dog because found in company unsuited to his taste and fancy.

I agree with him in some things, but in regard to my dog I fear his wholesale slaughter has been indiscriminate. There is need for no one to hold the end of my dog's tail. He has ample courage to do the same unaided. In conclusion let me add, I have others of this same type, fast staunch, and enduring—just such dogs as hit the eye, and good as ever greeted the gaze of practical sportsmen. WASHINGTON A. COSTER.

FLATBUSH, L. I.

##### Editor Forest and Stream:

A few remarks seem to me called for by Col. Taylor's last letter:

1. As to breadth of shoulders in setters and pointers. I inquired if there were any later and better authorities on this subject than Stonehenge and Idstone, whom I quoted as favoring narrow shoulders. In reply, Col. Taylor cites only Lavender, whose views on this point now are, I believe, generally conceded to have been wrong. The idea that breadth of shoulders greater, say, than Lavender's is essential to endurance and stamina is one that has very few adherents among the men who have given most intelligent attention to the subject. Col. Taylor ingeniously advances as an argument the fact that a narrow and shallow chest is undesirable in a man. So it is in a dog, and no one denies it. But I never heard that broad shoulders improved a man's chances in a long race or a short one. Depth of chest, thickness fore and aft, is pretty essential to good wind in a man. The analogy between man and the dog is not perfect, but as far as it goes, it is altogether against the Colonel. For use in harness broad-shouldered dogs are probably the best, although I do not wish to be supposed to speak as an expert on this point.

2. As to the color of setters Col. Taylor wrote that the setters at the New York show of 1882 were "wretchedly colored." Now, the preponderating color having been shown to be blue-black or black and white, with or without tan, he merely says he does not like the color. I am far as it goes, he is pardoned for doubting if being disliked by Col. Taylor is the same thing as being wretched.

3. As to liver being a "setter color." Here, also, the Colonel has toned down his original statement. He first said he remembered the time when it was regarded as exclusively confined to pointers and "everlastingly condemned" in a setter. Now he says it was regarded as "almost a blemish and not desirable." But even this last statement is too strong. The worst that should be said of liver is that for setters it is not so desirable as some other colors, principally, I think, because of its liability to fade. Faded liver is certainly a very ugly color, but it is my impression, although I do not know the fact, that a good dog liver is as durable as any other color, and it is certainly handsome. To my mind it is absurd to regard it as a sign of impure breeding; while for utility in the field it is

GLENCHO KENNEL'S RED IRISH SETTER DOG "GLENCHO."

WINNER OF FIRST PRIZE IN OPEN CLASS, PITTSBURGH, 1883.

unobjectionable. I should like to know just when it was "everlastingly" adumbrated. Was it during the career of Pride of the Border? Or before the existence of bench shows in America?

After what Col. Taylor has recently published in *FOREST AND STREAM*, I think he ought, in fairness, to show us, say at the next bench show in New York, what a setter or pointer should be. I should say he would be willing to take some trouble and incur considerable expense for the purpose. I for one shall look for his entry with some curiosity.

I am conscious that I have written in a more personal vein than I usually care to indulge in. I have done so because I consider that when a man writes in such a lofty strain of criticism as Col. Taylor, everyone else has a perfect right to examine and question his qualifications as a critic and to expose, if they can, his inconsistencies. It is hardly necessary to say that I concur in some of his ideas, especially about the tail-holding and setting up the dogs to look as wooden as possible. That kind of performance has often afforded me amusement, and I should be sorry, therefore, to have it abolished. *Pickett.*  
New York, June 2, 1888.

## CHICAGO BENCH SHOW.

(From our Regular Chicago Correspondent.)

**T**HE International Bench Show to be held here at Battery D Army, June 12 to 15, inclusive, is attracting great attention over the country, and being under the management of Mr. Charles Lincoln, there is little doubt as to its great success. The judges selected are well qualified for the position, and it is considered very fortunate that such a selection has been made.

Some information was gathered by your correspondent as to entries, though the official closing is not until June 4. There will be about 1,000 dogs entered in the seventy-four classes. The secretary has heard from the East, and a special car will leave New York on Saturday evening with twenty-five dogs of the fox-terriers, Yorkshire terriers, pugs, bull-terriers and bulldogs, all first-prize winners. A queer entry will be a wild Mexican dog, weighing only one pound and one ounce, by T. S. Peabody, of Chihuahua, Mexico, and it arrives here next week in charge of a guard, who never leaves him. This is the second time that one of these dogs has been exhibited in the United States. The other time was three years ago in New York, when a Mexican lady exhibited him. Another great entry is the celebrated pointer Bang Bang, entered by the Westminster Kennel Club for the first time in this country. He is now on his way across the waters. Every one will want to see him. The champion mastiff, Nevison, winner of thirty-three first prizes and cups, and the champion St. Bernard, Bonivar, both world champions, will be exhibited. It is announced that the great sire of the English bulldog, Rake, will be exhibited. The Hornell Kennel Club will enter a number of spaniels. Mr. J. H. Whitman, of this city, will enter some famous dogs, and, all in all, the promises for a grand and interesting list. There will be a large number of toys, poodles and pugs exhibited.

The building in which the show will be held is spacious and easy of access, and without doubt will be well filled each day with admiring crowds.

## CHICAGO DOG SHOW.

**A**T a meeting of the local committees of Chicago passenger agents, representing the following railroad companies: Baltimore & Ohio, Chicago & Grand Trunk, Lake Shore, Michigan Central, Pittsburgh, Ft. Wayne & Chicago, Pittsburgh, Cincinnati & St. Louis, the following circular has been issued: "Circular No. 46, Chicago Dog Show. To be held June 12th to 15th inclusive. Decided to carry dogs free, at owner's risk, when crated and accompanied by owner or caretaker."

The express companies have agreed to return dogs free if the same have prepaid their usual rates to the show.

CHAS. LINCOLN, Supl.

Arrangements have been made for special baggage car which will leave Jersey City depot of Pennsylvania Railroad 6 P. M., Saturday, and go through to Chicago without transfer, arriving there about 8 A. M., Monday, thus giving the dogs a rest before the show opens. An experienced dog man will accompany the car to take care of the animals, and ample food and water will be provided. Those who desire to avail themselves of this opportunity must apply to Mr. W. T. Dunnell, Room 5, 160 Broadway, before 4 P. M. Friday.

## GLENCHO AND TRIX.

**W**E give this week cuts of the red Irish setters, Glencho and Trix, owned by the Glencho Kennel, Peckskill, N. Y. Glencho is a capital specimen of the Irish dog, with but few faults. He made his bow to the public at Pittsburgh last April, where he easily captured first in the open class. He is not quite two years old and not yet fully matured. He is by champion Elcho out of champion Noreen. Trix is one of the best formed Irish bitches that we have ever seen. Her first appearance was at the New York show last month, where she won first in the open class. Soon after her arrival at the show she was purchased for the Glencho Kennel by Mr. Wm. K. Leute, of Seville, Fla., who was offered a large advance upon the price paid, but wisely refused to part with her. She is three years old, and is also by Elcho and out of Fire Fly. Both are said to be excellent fielders, and their owners may well feel proud of them. The cuts are from sketches by Harry Tallman, and are capital likenesses.

## THE SAN FRANCISCO DOG SHOW.

Editor Forest and Stream:

At your request I send you a few notes anent the Dog Show of the Pacific Coast Kennel Club, held at San Francisco last week. To show your readers that I am thoroughly competent to perform the task, I will state, *on possum*, that I had the honor of assisting the judges at Watertown, in 1878, or at least one of them (I picked up his hat). I also had the supreme pleasure of howling at Chicago early the next year when the judges placed such weeds as Ariam's Rock and old Leicester over my favorite, the beautiful Paris. I had my revenge, though, when Elcho beat Erin and Rufus. Here I rest my case, as the fact that I selected Elcho for premier honors upon his first appearance, when taken in connection with his since brilliant career, is proof "strong as holy writ" that as a reporter of dog shows I am *an fait*.

The show was held in Union Hall, on Howard street, commencing on Friday, April 27, and closing Wednesday, May 3. I was unable to be present until Monday, which was perhaps fortunate for me, as according to all accounts things were badly mixed during the first two days. Indeed, I thought that considerable more straightening out might with benefit have been applied to affairs all through the show. There were said to be about three hundred dogs present, which is perhaps a fair estimate. The catalogue was a "delusion and a snare," as many dogs entered were not to be found; but to balance this there were quite a number shown that were not down in the list; and worse than this, not a few of the dogs were entered in wrong classes. The building is not large enough for such a show, and the space allowed the spectators was at times uncomfortably crowded.

The dogs were upon the whole a fair lot, much better than I expected to see. The English setters were a class, the best of the show. The judging was upon the whole as satisfactory as could well be expected, although there was considerable growling by some of the "outs," but in most cases a glance at their exhibits would plainly show that the error in judgment could not be charged against the gentlemen who made the awards. Take it as a whole, the show was fairly successful. Let us hope that it is the precursor of a series of meetings that will give to both a benefit and an honor to the sportsmen of the Pacific slope. I fully intended to give a learned dissertation upon the comparative merits of the dogs exhibited, but I find upon looking over my notes that owing to the lamentable ignorance displayed in classifying them, some of my winners were transferred to other classes, and I will therefore refrain from comments. *Verbum sap.* Following is a list of the awards:

## FOXHOUNDS.

Dogs: 1st, Prof. E. P. Heild (imported tracky); 2d, withheld. High com., J. M. Bassford (Nap).

Bitches: 1st, withheld; 2d, J. M. Bassford (Judy). Very high com., Frick & Martin (John).

## GRYHOUNDS.

Dogs: 1st, J. J. Murphy (Stone-wall Jackson); 2d, T. J. Cronin (Chickopee). Very high com., W. Lane (Ruler).

Bitches: 1st, Robert Lyon (Young Minnetta); 2d, John Dugan (Lulu Newark). Very high com., T. White (Fly); Jas. Henderson (Gypsy).

Puppies: 1st, J. E. Carroll (Master Turkey).

## DEERHOUNDS.

## SCOTCH.

Dogs: 1st, Capt. A. J. Hutchinson (Sheik).

## SETTERS.

## ENGLISH.

Dogs: 1st, H. D. Bartlett (Rob Roy); 2d, J. C. Nealon (Dick). Very high com., D. E. Goodman (Bob). High com., J. de Vault (Bill).

Bitches: 1st, E. H. Farmer (Queen); 2d, T. R. Jacobs (Fannie). Very high com., J. le Vault (Beauty); M. D. Goodman (Daisy G.).

Puppies: 1st, E. H. Farmer (Markie); 2d, John de Vault (Royal Duke). Very high com., H. D. Bartlett (California Rose). High com., R. W. Martin (Jim Budd); R. W. Martin (Jess); H. A. Mayhew (Mars).

## LLEWELLYN.

Dogs: 1st, E. L. Mayhew (Dan); 2d, O. K. Hopkins (Coin II.). Bitches: 1st, Henry Payot (Cleopatra).

Puppies: 1st, D. M. Tyle (Daisyette); 2d, J. B. Martin (Chispa). Very high com., E. L. Mayhew (Topsy).

## IRISH.

Dogs: 1st, H. M. Briggs (Race, Jr.); 2d, R. W. Hills (Nemo). Very high com., Samuel Austins (Ben). High com., Geo. Kommer (Flash).

Bitches: 1st, H. C. Chipman (Beatrice); 2d, H. M. Briggs (Fern). Very high com., Frank G. Abell (Red Bess). High com., Wm. Hearst (Kato II.).

## GORDON.

Dogs: 1st, Dr. H. C. Davis (Duke); 2d, F. A. Tafts (Dorr). High com., J. S. Van Doren (Patsy).

Bitches: 1st, C. Krumbach (Nellie); 2d, T. J. O'Keefe and S. L. Abbott (Peggy). Puppies: 1st, E. N. Underwood (Fannie); 2d, W. W. Morrison (Professor).

## POINTERS.

Dogs: 1st, G. W. Bassford (Ranger Boy); 2d, prize withheld. Very high com., R. E. Bell (Jack). Com., Dr. H. C. Davis (Rex).

Bitches: 1st, G. W. Bassford (Grace Bow); 2d, G. W. Bassford (Josie Bow). Puppies: 1st, Geo. H. Peabody (Victor Bow); 2d, H. A. Bassford (Butte Bow). Very high com., J. M. Bassford (Keno Bow); Gen. G. B. Crosby (Bow, Jr.).

## SPANIELS.

## RING CHARLERS.

No award. Irish Water. Dogs or Bitches: 1st, Albert Miller (Dash); 2d, A. W. Havens (Roger). High com., C. A. Story (Ben).

## ENGLISH WATER.

Dogs: 1st, R. C. Johnson (Jannus); 2d, J. F. Hoffmann (Sam). Bitches: 1st, John Struven (Nellie).

## Cocker.

Dogs: 1st, Miss V. Rutter (Kiddie-a-Wink). ENGLISH RETRIEVERS.

Dogs: 1st, A. C. Tullio (Curley); 2d, E. H. Friten (Bob). Bitches: 1st, John N. Korrner (Nigger); 2d, Wm. Betel (Nell). Very high com., James Lawler (Juno).

## NEWFOUNDLANDS.

Dogs: 1st, John Guellet (Dover); 2d, J. E. Slenkey (El Monte). Very high com., C. A. Story (Dick).

Bitches: 1st, Wm. Cawley (Flora). ST. BERNARDS.

Dogs: 1st, M. L. S. Sanceron (Lion); 2d, H. M. Norton (Jack). Very high com., W. H. J. Matthews (Toot).

## GREAT DANES.

Dogs or Bitches: 1st, A. B. Spireckels (Diana); 2d, O. Tolle (Baton). Puppies: 1st, O. Tolle (Major).

## MASTIFFS.

Dogs or Bitches: 1st, James Henderson (Juno); 2d, W. F. Pettigrew (Sport). Puppies: 1st, Thomas F. McNamara (Queen).

## COLLIES.

Dogs: 1st, J. McNab (Max). Bitches: 1st, J. Cullaghan (Gypsy).

## DALMATIANS.

Dogs: 1st, Dr. E. H. Woolsey (Spot). Very high com., Dr. E. H. Woolsey (Speck).

Bitches: 1st, A. J. Kelly (Nellie Dotter); 2d, H. B. Slocum (Dolly). Puppies: 1st, F. W. Sharon (Tiger); 2d, W. T. S. Moley (Hull). Bitches: 1st, A. B. Trauman (Sadie McCallan).

## TERRIERS.

Dogs or Bitches: 1st, W. M. Dyer (Sabbath); 2d, Samuel Ambler and J. H. D'Arcy (Nell). Very high com., F. Dwyer (Lion).

Dogs: 1st, L. T. Ewen (Pete); 2d, D. Shannon (Paddy). Bitches: 1st, J. W. Orndoff (Gypsy); 2d, J. F. Carroll (Fly). Very high com., J. B. Lewis (Anna). Puppies: 1st, W. W. Tuffy (Tuffy); 2d, D. F. Crowley (Tome). Bitches: 1st, C. H. Joubert (Bess) imp.

Dogs: 1st, Robert Bruce (Fido). Bitches: 1st, W. Hearst (Blue Bonnet). FOX.

Dogs: 1st, J. Boyd (Dandy).

with six times their bulk of water; in the ear and gently knead to base with the fingers. We would also advise an occasional dose of Epsom salts. Feed plenty of well-cooked vegetables.

Sept. 12.—After the usual swim and breakfast, went out for a few hours, returning as before.

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, JUNE 14, 1883.

VOL. XX.—No. 20.  
Nos. 39 & 40 PARK ROW, NEW YORK.

## CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

## SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

## ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

ANSWERS TO CORRESPONDENTS.

## THE TEAM QUESTION.

BEFORE the issue of another number of the FOREST AND STREAM, the American team will have sailed for the British shores. They will go accompanied, we are sure, with the best wishes of every American citizen, and we hope with enough of the coin of the republic to make their jaunt a pleasant one and enable them to fitly discharge the duty of representing the American National Guardsmen on foreign ranges.

With the history of the make-up of that team our readers are familiar. It is a squad which fairly represents to-day the best available shooting material in the ranks of our citizen soldiers. It is not easy to secure a dozen or more men who are willing and ready to make such a trip as that undertaken by the American team, and especially when these men must be experts in a very difficult art.

The National Guard of the country does not make a very creditable showing in this matter. After months of notice, we find but twenty-nine men appearing to contest for places on the team, and of these several were shooting merely for a record. The fact is, that marksmanship has not yet become a part of the Guard system here. While the public and the men in uniforms will flock from near and far to witness a contest in the manual of arms, or to see a picked company strut up and down a paved plaza in the evolutions of the squad drill, but a man here and there can be found who has a well-founded knowledge of ball practice, and who can put that knowledge into play. Aside from the beggarly show which the Guard of the whole country makes when compared with the whole male adult population, there is wanting in the Guard, as at present organized, that conception of a soldier's duty which gives to rifle shooting an important place.

But the team as organized is a strong one. A glance over the records made during the weeks of preparation and drill at Creedmoor, will show to the experienced reader that the men come very near to the maximum which may reasonably be expected of a military breech-loader. A year ago the

British team, which visited America, and had such an easy victory, were not as competent as the men now leaving our shores. That is, judged by the records made by them in practice and in the match. There were certain points in which the English team showed great strength. Individually they were far in advance of the men who composed the American team, and we cannot hope to equal them in that respect until we too have secured such an immense field of choice as is shown in the ranks of the British Volunteers. This year will find a system of team management and discipline, which will mean a great many points on the American score.

Public opinion in regard to the team has been largely modified by the action of the Board of Directors. A great deal of childish wrangling and foolish exhibition of petty spite on the part of the "has-beens," has served to bring the whole matter into much dispute. There should not have been from the start anything concealed or done in an underhand fashion. There was such a star-chamber proceeding, and while the popular verdict would, in all probability, have sustained the directors had they declared their opinion that the rejected marksman was an undesirable person to place on a team, there is no doubt that the N. R. A. management has lost much in popular confidence by the far from manly fashion in which Mr. Farrow's case was disposed of. This is a matter which, so far as the present team is concerned, has passed into a "by-gone," and unpleasant things of that sort are always best when forgotten.

The work of the team is before it, and for that work it is fully competent. Col. Howard may not be statuesque, but he has managed to show that he has a quiet working method, and if the men are acting in good faith on the ammunition question, he ought to know just what he can rely on from each man. This is something which the captain of the last team never did know. Should defeat come to the Americans, it will simply be that chance of conflict which may at times send the best equipped and most competent adversary to the wall. It will not be from that utter disparity between the opposing forces which marked the match of 1882.

The pressing need now of the team is a substantial financial backing. The entire National Guard of the country will be disgraced if the team is sent abroad poorly equipped, and the civilian citizen will share in that disgrace. From our knowledge of the management of the team we feel safe in vouching for the economical expenditure of all funds raised for this purpose. There has been much sacrifice of time, labor and money by the men on the team, far more than may ever be known to the world at large; but every man who will feel a thrill of pleasure in the victory of the team should do something toward bringing such a result about and this can be done in a measure by liberal subscriptions.

## FISICULTURE IN ENGLAND.

IT is only within the past two or three years that a few of the more advanced fisiculturists of England have taken to reading the reports of what has been done in the United States and in Germany, and have candidly told their fellow workers that England was far, very far behind those countries. It is exceedingly hard for Englishmen to believe that their land is not up to the standard in all things, and when Mr. Arthur Chambers, President of the English Fisicultural Association, and Mr. R. B. Marston, editor of the *Fishing Gazette*, both publicly stated that their country was far in the rear in this matter, it created some surprise. The fact is, that for years there have been some efforts in this direction, but they have been the work of individuals, who realized the necessity of increasing the stock of fishes, but who lacked the financial support of the government. Mr. Francis Francis early started the good work of salmon breeding, and of sending the eggs to Australia, and he was followed by Mr. Buckland, who, however, seemed to be ignorant of what had been done abroad, and therefore groped in the dark to a great extent. To illustrate this, he packed salmon eggs for Australia on the day they were taken and, of course, lost them, where if he had taken the pains to read American reports, he would have learned a fact known for years previous by all intelligent fisiculturists, that the egg does not bear long transportation well until the embryo is visible to the unassisted eye.

These facts have been called up by the following extract from a report on the International Fisheries Exhibition in the London *Field*, which says of the American display:

In pisciculture there is a large and varied show of models and other apparatus. Many of the models appear to be rather needlessly complicated, though exceedingly ingenious. There were plans

of hatcheries, trays, carriers, hatching boxes in various forms and of varied ingenuity. The same may be said of a large collection of models of fish passes and salmon ladders. They are ingenious beyond all doubt; but many of them are, we fear, too ingenious to be practicable. In these matters there are certain broad principles to be observed: if these be recognized the work is easy; but if they be not, all the ingenuity in the world will not replace them. Among the most interesting things in the American exhibit is a large and fine series of black and white pictures of all manner of piscicultural operations. The United States have done well, and altogether make a fine exhibition.

If there is anything in which the fisiculturists of America excel it is in their apparatus which is designed to accomplish the greatest results in the least space and with the minimum of labor. There have been implements devised which are needlessly complicated, and these are possibly shown with the Government collection, but they are not those which are in common use, or which will be found in the models of the best hatcheries. Of the salmon ladders which the *Field* fears are "too ingenious to be practical" there are some which exceed by far any in use in Europe. For instance, the McDonald fishway may appear to be complicated, but its principle, which is different from any other, is simple enough when seen at work, and a fishway up which a man can row or pole a boat is certainly a practical one. The "broad principles" in the construction of fishways are, a diminished speed of water down an incline as short as possible. The device which accomplishes this in the best and cheapest manner, need not fear to be called ingenious.

There are some excellent private fisicultural establishments in England which sell eggs and fry at high prices, such as obtained in America ten years ago, but beyond stocking the waters of some of the nobility, not much has been done. The proposition to hatch what in England are termed "coarse fish," such as pike, and the cyprinoids of the rivers, has received much favor, and if the new Association carries it out, it will afford both food and sport for those who do not own vast parks with lakes and streams, which are of use only to the owners. We believe that the day will come, and come soon, when England will work up to the present high standard of fisiculture on the Continent and in America, and those who plainly tell the people that they are behind other countries in breeding fish are the best friends of the cause. If the new Fisicultural Association can work up popular interest in this question and obtain government recognition and financial aid, we expect to see a body of progressive fisiculturists spring up in that land that will make their mark on this industry, provided that some person whose only claim to distinction is a long title is not put at the head of it.

England has several earnest workers in this field besides the gentlemen named. Mr. Charles W. Harding has been experimenting with the breeding of mussels and oysters in Norfolk; Mr. Charles C. Capel, of Fooks Cray, Kent, has a hatchery for *Salmonide* which is well known on this side of the water, and there are others who are earnest, capable men, who should long ago have had charge of government works to provide fish for the million, instead of for the few wealthy persons who plant them merely for sport.

Fisiculture in England has been mainly a toy for the rich to play with, and hence there has not been that stimulus to devise space-saving and labor-saving apparatus, which will turn out millions of fish into the public waters at the least expense. It has never had the slightest aid from the Government, notwithstanding the fact that thousands are engaged in the coast fisheries, and that the people consume vast quantities of fish. The salmon rivers of Great Britain are kept from exhaustion by protection alone, but with a plentiful yearly stocking would produce many more fish than at present. The Fisheries Exhibition, now in progress in London, should open the eyes of the Members of Parliament to these facts.

THE REPORTS RECEIVED from the various fishing localities, far and near, would seem to indicate that the prospects for the sport this summer are unusually good. The season opened very late in all localities, and those who tried the overfished streams near the cities, as soon as the law was off, returned disappointed, with empty creels and drooping rods. We are inclined to believe, however, that this is to be a good fish year, and that the same old frosts and storms, which annually destroy the peach, the corn, the wheat and the ice crop, have this year left the trout and the bass harvest unharmed.

DR. JAMES A. HENSHALL will publish in illustrated book form the two series of "Florida Sketches," contributed to this journal. The entertaining material contained in those papers was ample for a successful volume; and our readers will welcome them in the new form.

more for a watch-dog than anything else. After going twelve miles up the valley we reached the Santa Ynez Mountains, and began the ascent. We lightened the load for the mules by getting out and walking up the steep places. Wild cherry or plum trees grew abundantly by the roadside, and their sweet fruit was very refreshing. When plentifully laden, the fruit sometimes intoxicated a person. The day being warm, we toiled slowly up the mountain. Several times we came upon the trail of a huge rattler or other snake, which lazily dragged itself across the dusty road, and after two hours' hard climbing, we reached the summit. The view above well repaid us for the exertion. Range upon range of brush and timber covered mountains stretched before us for miles. Three thousand feet below, across a deep canon, the road lay serpentine. Windings no longer disappear, but they reappear further on, until it is too slight in the distance. Fifteen miles away is the grand Pacific, its various currents plainly visible; some of dazzling brightness from the sun shining upon them, and others of a deep blue color. In the air above are a number of vultures that would measure from eight to ten feet across the wings, lazily wheeling about in large circles. Everything is quiet. Even the birds are silent from the heat. A cold and air of business pervades the scene. One almost imagines he could live forever on nothing but climate and this enchanting view. But we are soon roughly aroused from our reverie by the voice of Frank telling us to "come on, and not keep us waiting all day!" We reluctantly leave the spot, and getting in the wagon begin the descent. On making a sharp curve we ran over a rattlesnake, and it being only crippled, we couldn't resist the temptation to get out and eat its earthly career, thus adding its nine rattles to our collection, the largest of which consists of fourteen rattles and a button.

We ate our lunch in a shady recess near the road, where a cold spring of pure water bubbles up, and by two o'clock reached the foot of the mountain. About five o'clock we came to the ranch of Mr. Cyrus Marshall and decided to camp there for the night. Mr. M., being an indefatigable worker, we were somewhat surprised to see himself and wife dressed in a cotton and air of business pervades the scene. One almost imagines he could live forever on nothing but climate and this enchanting view. But we are soon roughly aroused from our reverie by the voice of Frank telling us to "come on, and not keep us waiting all day!" We reluctantly leave the spot, and getting in the wagon begin the descent. On making a sharp curve we ran over a rattlesnake, and it being only crippled, we couldn't resist the temptation to get out and eat its earthly career, thus adding its nine rattles to our collection, the largest of which consists of fourteen rattles and a button.

We were on the road by daylight the next morning, and camped about eighteen miles up the Santa Ynez River at a beautiful spot. We were kept awake that night by the coyotes, and it being moonlight we endeavored to get a shot at them, but were unsuccessful. Before the sun had risen the next morning we were on our way, and leaving our two companions to their slumbers, hastily rigged our fishing tackle and stole down to the river a few feet away. The river is not more than thirty yards wide at any place, but it is very clear and contains lots of trout. We made a cast and immediately felt a tug, and then a rush, and presently landed a fine one that would weigh a pound and a half. In a few minutes twenty-three were in our creel, averaging a pound more in weight, and in the evening more a number of them were in the frying pan. The savory aroma greeted the nostrils of Jim and Frank on awakening, caused them to den their clothes in haste. After a breakfast of fried trout, camp biscuit and coffee with condensed milk, we made our plans for the day. We were all going to hunt. Jim started out one way and Frank another, while we stayed a few minutes to fix up things around camp. Just before we were about to look across the river and saw a large coyote trotting along. He was about thirty yards away, and taking good aim we blazed away. A little spout of dust raised before him, and the fact was made apparent that we were not Dr. Carver or some other famous shot. We concluded not to shoot again, for when we got ready the coyote was about half a mile away. When he heard the shot he started, and all that could be seen of him was a grayish streak.

Before we got fairly started from camp we heard Frank fire six or seven shots in rapid succession, and soon he came running to camp after Dave to help him in capturing two bucks he had wounded. Dave took the track of the one that had gone toward the river, but after going half a mile lost the track, and appeared much at fault. We assisted him, and finally he found it again and soon came upon the track of a very vigorous two-year-old buck, with one hind leg broken, but he was well rested, and the fight was truly exciting. The deer would strike most forcibly with his fore feet, but the dog would watch his chance, and seize him by the throat, choking him down, when, loosening his hold from exhaustion, the fight would begin again with renewed fury. But it was evident that the dog would prove the victor, and calling him off we shot the deer through the head. After trying in vain to drag him to camp, we huffed him over a rock, and he was soon dispatched. We had followed the track fully six miles, and were now two miles from camp, as tired and footsore as can well be imagined. We hung the buck and hobbled back to camp, gave Dave an early dinner and washed him in the river, he being covered with blood from his recent encounters. Jim returned with a few quail as the result of his skill.

The next day we found a bee tree near camp and Jim rode one of the mules eight miles to borrow an axe to cut the tree down, and found that he had come upon a three or four year-old buck, with one hind leg broken. Everything showed that the battle had been severe, but Dave had conquered, and the deer was now at his mercy. After resting about twenty minutes we pushed the buck with our foot, when he jumped up straight nearly six feet and started down the mountain, bounding over brush and rocks at a rapid rate, but by the time he had gone two hundred yards he was again on the ground, and was soon dispatched. We had followed the track fully six miles, and were now two miles from camp, as tired and footsore as can well be imagined. We hung the buck and hobbled back to camp, gave Dave an early dinner and washed him in the river, he being covered with blood from his recent encounters. Jim returned with a few quail as the result of his skill.

Jim returned with a few quail as the result of his skill.

were opposite him, and we were so near that we could almost or quite touch him with the whip. He ran about two hundred yards and stopped, looking at us, as if wondering who we were. He had probably never seen the like before. As we had plenty of fresh meat we didn't bother him. Going on a few miles further we came upon a hunter's cabin. The occupant had not seen the face of a white man for three months and was overjoyed to see us, and gave us the privilege of using anything of his that we cared to. He was a fine specimen of a backwoodsman, standing full six feet, straight as an arrow and a fine shot. Surrounded by his dogs, horses and chickens he leads a secluded life. He had about thirty deer skins, and pressed us to accept all the "jerkey" we wanted. He informed us that he came from New Orleans in 1860, and since then had led the life of a hunter and trapper. His pride about the breed-leader is so strong that he would not allow one the space it took up, and so he uses the muzzle loader entirely, hardly looking at our Winchester.

We pushed on two or three miles further and camped. Not having any fish for supper, Jim and the writer went to the river and saw in one pool what we estimated to be at least a thousand trout, and in the shallow water we caught enough with our hands for two or three meals. Nice, large ones, too. We killed a rattlesnake that day that measured four feet in length and twelve inches in circumference. It was the largest we had ever seen and had eleven rattles. The next morning we saw three deer feeding on the mountain about four hundred yards away, while we were eating breakfast. Frank took his rifle, and by making a detour succeeded in bringing one down. I went to his assistance, while Jim went after a couple of coyotes he saw some distance away. When I reached Frank saw that he had killed one of the largest bucks I had ever seen. The bullet went in one ear and came out the other, killing the deer instantly. Frank declared that he had killed it at fully 275 yards. We disputed the matter with him, until we stepped the distance off and it was just 153 paces. With difficulty we dragged the deer down the mountain and then went to camp and hitched the mules to the wagon. To bring the deer to camp, but he was so large that we could not lift him into the wagon, even after the entrails were removed, and we were not very weak, either. By cutting the head off we finally got him into the wagon by very hard lifting, and started for the camp. If Nast could have seen us logging away at that deer he might have enriched *Harper's* with a cartoon that would have added to his fame. After returning to camp it was hard work to hang him high enough to dress, but after much trouble succeeded in doing so. He was a decidedly the largest deer we ever saw, and his wide branching antlers probably grace the walls of Frank's room at the present moment. Jim returned after we had accomplished all the hard work, minus a coyote, but with a lynx he had killed. Its color was white and yellow, and it was eighteen inches tall and twenty-nine inches long. We saw a large bear track that day that measured nine by fourteen inches. Its large size was caused probably by the hind foot stepping in the track made by the one in front.

No bears were seen by us on our trip, though numerous tracks were noticed. The writer killed only one deer, and that was a small one. We killed a great many quail, they being very plentiful, some flocks that I have seen numbering thousands. When a flock of that size take wing the noise made resembles distant thunder. In some places farmers have to guard their young grain from their depredations. Trout were abundant almost everywhere in the streams. We saw many deer that we did not shoot at, because we had plenty of fresh meat. One herd contained thirteen, all grown ones. Although we saw no bears on this trip, we did on others, and in the future may describe how we were treed by an old clubfoot.

FALLS CITY, NEB.

## FROM A SPORTSMAN'S NOTEBOOK.

NEVER could understand why all compass needles are not of such form as to designate, at a glance, the north pole.

Most of the pocket compasses have the needle pointed alike at both ends, one end being polished, and the other, the north, left blue.

Supposing a fellow, having failed to notice this difference, should become lost, and "consequently" turned around, and what use would the compass be to him? Of course, no old hunter would be caught in any such foolish scheme, but the tenderfoot might. If the t. f. were a scientific man, or one who happened to remember all the points in the natural philosophy of his school days, he could easily prove to himself which was the north pole of the needle as follows: Hold the compass on a level spot on the ground, hold the gun nearly vertical, look at the muzzle, one end of the needle outside the case of the compass would be pointed toward you, and violently repelled; this is the north pole. In the Southern Hemisphere he would have similar effects with the south pole, or blank end of the needle. Any mass of iron, set on end, would answer the same purpose as the rifle barrel. This effect is supposed to be due, partially, to the "magnetic moment" of the iron, and also to the natural polarity due to the earth's influence, a subject of prolonged study by Sir W. S. Harris, who published a report for the use of iron ships.

Last Sunday I watched the movements of a crow-blackbird in my door yard. He was only about twenty feet from me, and by using an opera glass I could see everything plainly. He would hop around and tip his head to one side and peer steadily for a moment at the sod, then with a few picks he would bring out an angle worm. This he would put his foot on and pull in two, and swallow the parts. Finally he found what appeared to be a May bug. This he pulled to pieces, but I could not tell whether he swallowed any of it or not, but he kept what appeared to be the wings or thighs, and, perhaps, some other parts in his mouth. Then he found more worms and would lay down the pieces of bug until he had eaten the worms. This he repeated several times, always picking up the pieces of bug, which he finally flew away with. I suppose these were tidbits for his young.

Talking about fishing, I did some funny work one time. It was during the war. I was on the Gulf, bound for Southwest Pass, mouths of the Mississippi, from Brazas de Santiago. The little schooner was sailing along very slowly, when we noticed some large fish acting very strangely. One was much larger than the rest. I should think, as I remember it, some five or six feet long. This one kept directly under the boat, except when she came out to chase away five or six smaller ones, perhaps thirty inches long. She

would drive them further than we could see in the beautiful clear water, but returned to take station under the boat, to be soon followed by the smaller ones, which would linger just under and alongside the rail. We had a dolphin line over the stern, with a ring attached to the large hook. I took this hook and bound it to the end of a pole, with the stout cord still attached to the hook, and carried up the pole, as a measure of safety. With this rig I sat on the rail midships, and by divers jerks and twitches, finally hooked one of the fish near the tail. With the help of the captain I succeeded in hauling him aboard.

This fish were called by the captain of the schooner "albicore," as near as I can remember, and he said he never saw one caught, and laughed at the idea of my attempting it. After one was caught he took a lively interest in the matter, found an old spear-head in the hold, which we sought out to the same pole, and succeeded in spearing another fish, when the rest suddenly disappeared.

That day we had a fish dinner. I was hungry; had been living for some days on army rations, bacon smothered in onions, which I detest. My mouth waters at I write of it. I have "fed" at some high-toned tables, with all the adjuncts of sauces, but no fish ever tasted half as good. This isn't much of a fish story, compared with your "Jottings from Jersey," but the statements are cold facts.

Would like to know whether I have the correct name for this fish; he was dark blue. I think, on the back and light beneath.

We afterward speared a dolphin, the "King of the Sea." He was the most beautiful fish I ever saw, the "rainbow-tinted" sides of the "speckled beauties" being way off in comparison. I remember that the top part of the dolphin's head struck me at the time as being of the most perfect lines for clearing the water, that is from the mouth up. Turn him on his back and the top of his head would make a model for the prow of a clipper. Am I right or is my memory at fault?

In cooking the dolphin the old superstition of putting a piece of silver in the pan with the fish was followed, and as the silver was not discolored we ate the fish.

Speaking of explosives, the *Scientific American* quotes from the London *Observer*: "An explosive is a body of unstable chemical composition, which, when its chemical equilibrium is disturbed, suddenly expands in bulk. Gun cotton may be held in the fingers and burnt, but if a detonator be attached to it, and it be clapped between the palms of the hands, it will blow a man to pieces."

Chloride and nitrogen will explode with terrific violence if the bottle containing it be tapped with a feather. Explosives may be roughly divided into combinations which are purely chemical and those that are chemical and quasi-chemical. Nitro-glycerine is purely chemical. All purely chemical compounds decompose spontaneously and group themselves into sub-combinations of a treacherous nature. Nitro-glycerine can be carried about safely, but if kept for any length of time it passes through internal changes which render it unsafe.

I suppose black powder to be a simple mechanical mixture, and if kept dry can be kept for centuries unchanged. Is it about wood powder? Probably the boys had better use it if at all, and if they do, they should be very careful. It is pretty powder to use, for many occasions, and it is to be hoped it is as safe as it is declared to be by the manufacturers.

CLEVELAND, OHIO.

### ANOMALIES IN BIRD-LIFE.

I HAVE spent most of the present spring at Northford, Conn., a little village located seven miles northeast of Long Island Sound, just above New Rochelle. On Thursday morning, April 26, as I was walking there near Farm River, a man named Dunklee told me he had just seen a "white robin." Thinking he possibly was mistaken, I hurried on in pursuit of the curiosity. I found that Dunklee was right; it was a genuine red-breasted robin (*Turdus migratorius*), and as tame as a chicken. It permitted me to come within five or six feet of it, and even my nearer approach occasioned it no serious alarm. Its head and breast had the usual color and markings of a male robin, but every other portion of it was perfectly snow white. Flight, size, "chirrup," everything, except the strange coloring, proved unmistakably that it was a robin.

This and several similar instances already narrated lead me to suspect that some species of birds occasionally combine with other species. Many ornithologists will smile at this, while others, perhaps, will think it over and reason that it is not altogether impossible. When it is once considered that, with the exception of a mere handful of scientists, the habits and peculiarities of birds are not generally observed, and that new facts are constantly coming to light, equally as strange as my theory, those deeply interested in things ornithological certainly must concede that what I have said is worthy of a second thought. In support of my theory one instance has come under my personal observation, which I must give now for the expansion of my door-yard. A Baltimore oriole (*Icterus baltimore*) nested in my door-yard last summer that differed from all other orioles that I ever saw or heard of, in this respect: after singing its own sweet song it would rattle off the whole beautiful jargon of song, common to the catbird (*Geothlypis trichas*), even to the spiteful cat yawl that gives the catbird its common name. Optical illusion, delusion, or other absurdity may be argued, but I know better: the bird was not in my study windows all summer long, and I saw and heard it several times. It is possible, and barely possible, that the oriole had learned to imitate the catbird's song, but I doubt it. It would be no more absurd to argue that an eagle might, under certain circumstances, learn the coo of the dove. Scientists accept the term hybrid, or mongrel, in describing monstrosities in the quadruped kingdom, and I am at a loss to understand why they reject its application to birds. It is possible that thorough investigation may some day show that the fanciful and pretty theories that now exist respecting "bird-virtue."

LEW VANDERHOEF.

NEVERVILLE, N. Y., May 11, 1883.

[That hybrids between different closely allied species do occasionally occur among birds is well established, but that such occurrences are rare is very certain, and that such hybrids are fertile *inter se* and produce young like themselves

**GAME RESORTS.**—We are always glad to receive for publication such reliable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

### A DEER HUNT NEAR MONROE, LA.

BY G. D. A.

SEVEN miles above Monroe, on the east side of the beautiful Ouachita river, is one of the most noted, pleasant and successful places for deer shooting in the State of Louisiana. I mean in ante-bellum days—just at it is at this time I am unable to say. In addition to deer, no better ground could be found for indulging in the delightful amusement of hunting wild turkeys or chasing wildcats. The lake and river abounded in barfish—or striped bass—trout, and every variety of perch usually found in Southern waters. It is called the "Horseshoe," being a peninsula formed by a large lake in the form of a horse shoe, the heels of the shoe reaching out for fifty yards of the river, and not over two hundred yards apart. The interior of the Shoe was a long, rather narrow body of land, pretty high in spots, and covered with dense long fishing-pole cane. Parallel with the banks of the lake were several sloughs filled with water in winter, but dry in summer. Many water oaks and persimmon trees grew in these sloughs, the acorns attracting the ducks and the ripe persimmons the deer, which are especially fond of this fruit. The Shoe itself was a long and wide lake, deep in places, and with high banks generally on both sides. At the time in which this hunt, to which our article is devoted, came off, this lake abounded in alligators; in fact, they were so numerous that the deer would not take the water unless absolutely compelled in order to escape the dogs and hunters, and no dog would cross it often more than once or twice if not caught by the alligators, being so badly frightened that they never venture into the shallow bird-line slough. It was not very wide across the Shoe, but there was a sufficient body of land to offer a strong attraction for the deer, on the same side of the river on which the lake was, to go there and lie during the day, and even a stronger one to the deer frequenting the pine flats that bordered the river on the west side. Those deer would swim the river at the point between the heels of the Shoe, and then were safe from the hunters that pursued them from the east side. At night they swam back and fed on the hills and pine flats.

Often as many as twenty to fifty deer would lie in the Horseshoe at a time. It only afforded hunting for one day. The plan of the hunters of Monroe was to send up a party of servants with the dogs in yawls, to go by water, and land at the mouth or rather head of the Shoe, while they rode by land and generally arrived some time before night, so as to occupy the whole heat and keep the deer inside until next day.

Mr. Charles W. Phillips, of the old firm of Williams, Phillips & Co., had arrived from New Orleans on his way to visit his plantation on the De Siard Island, on which island was this Horseshoe. His friends, consisting of James McEnery—the eldest brother of the Gov. McEnery, Tom Scarborough, Joe Mason, Henry Dinkrave, his half brother, and Ludeling, subsequently the Chief Justice of the State, and your humble servant, met and agreed to give Mr. Phillips a hunt at the Horseshoe; to go up one afternoon, camp that night and return the next day.

A more lively, jolly set never went hunting, prepared to enjoy themselves no matter what turned up. All were successful hunters except Mr. Ludeling, who, I think, had never taken so long a hunt before, and I am certain had never killed a deer until on this occasion.

Three yawls were sent up the river with the hounds, and supplied with all the fine liquors, wines, cards and good things that the eating and drinking saloon of Charlie Austin (who was then living, but a short time afterward was basely murdered) could supply.

The hunters took their guns and rode on horseback to the appointed place. Strict orders had been given to the servants that rowed the yawls, to make no noise until they had gone into the canoe, and to get certain old fowling coats, should they reach the rendezvous before us. My shotgun had been sent on the yawl, and I bore my rifle, intending to have a turkey hunt, or a still-hunt the next morning at daylight.

There were seven of us, four have been gathered to their fathers, and three survive. In those days, fine wines, liquors and card-playing, (whist and euchre), were the fashion, and I must confess, I was not a very good player, but cigars, that one could get them in perfection. I never drank, nor did I play cards, but as to cigars, one could always get on my good side, if I had one, by offering me a genuine old black Cuba-Principe.

We reached the ground in advance of the negroes, kindled fires along the 200 yards between the heels of the Shoe, and had a merry time before the arrival of the yawls. After that time, ten or twelve negroes, each with a gun, came out and each sea of himself to have a good time generally. We congratulated ourselves on being the first camping party of the season, since we could find no signs to indicate that any one had been in to disturb the deer. My particular hunting friend, Henry Dinkrave, gave me directions how to take a stroll outside of the lake, in order to learn the bearings of the woods, so as to have the still-hunt the next morning. I took my rifle and went off to camp at six directions while a part of the hunters rigged their fishing poles, and during my absence had succeeded in catching more bar, or striped, bass than we all could eat. I returned by sundown, having learned all I desired about the surroundings and the game. I found a long piece of ground on the lake, from which the cane had been burned, leaving it clear of undergrowth, and on this place were plenty of signs of deer and turkeys. The ground under the cane was covered with acorns, and the deer fed at night. I saw ten fresh and large "scrapes" made by the bucks, and I was confident of finding one there the next morning.

It had been agreed, too, that no one should fire a gun before morning, for fear of frightening the deer inside of the Horse Shoe. Mr. Dinkrave had taken a walk along the high bank between the heels, and reported finding a great deal of sign of deer. Sanguine was every one about this note of success, successful hunts that had been witnessed on this note of success. After the heartiest supper I ever ate, and one I really enjoyed, I laid down in my blanket to watch the party earnestly engaged in playing euchre. "I'll bet a hundred dollars," said Phillips, putting a small trumpet on Scarborough's

ace of diamonds, "that I kill the first and biggest buck to-morrow."

"Take that bet," replied each, "that you don't."

"Bring that basket of champagne here," said McEnery, speaking to his servant; "I'm getting awful dry."

"I'll bet a hundred dollars," said Phillips, "that I will get a good old Bourne whisky, I do not know."

"I'll bet fifty dollars that Ludeling kills a deer," said Scarborough.

"I'll take it," said Dinkrave, "for he never shot at one in his life."

"Don't you bet, Tom, for I really never shot at one," said Ludeling.

Before lying down I had got Mr. Dinkrave to promise to wake me up before light in the morning. I knew they were going to play and drink all night. So, after watching them for some time, I turned over to go to sleep, but I heard, before I went off into the land of Nod, Mr. Mason offer to bet a large sum "that if a deer was killed that Col. A. would be the one to kill it," and another sum that I "would kill one on my still-hunt in the morning," both of which bets Mr. Phillips took, and then called for the fish and oysters and coffee.

I had no more, until nearly daylight. I felt someone pulling and shaking, and recognized the heavy speech of Henry Dinkrave, "Get up (hie) Col. A. (hie), if you want to go still-hunting (hie), here's a cup of hot coffee." In a moment I was up, drank the coffee and started, telling Henry if I shot and blew my horn, to come to me, with a horse. Unfortunately I omitted to take with me any matches. I had lighted a cigar when I started, and had a pocket full of me. It was the dark of the moon in October, and it would only be visible a short time before day-break. A more favorable time for finding the deer could not be chosen, besides, the ground was damp, it having rained the day before we left Monroe.

It was about a half a mile to the "burn" I had found the evening before. There was good walking along the edge of the water of the lake, and all I had to do, after getting to the burn, was to softly creep up to a high bank and peep over the edge. The first and second time I did so nothing was seen, but the third (by the way, is not the number three a lucky one?) I was rewarded by seeing a massive head with a wide pair of antlers appearing above a large prostrate cottonwood tree. The buck neither saw nor smelt me. I had discovered the omission of having no matches, and I could not afford to lose my lighted cigar. Creeping back, I laid the cigar in a place where I would have a sufficient light to see my rifle and spent the time in the triagers, and then peeped over the bank. The deer had not moved his position. Never did I take more deliberate aim. It was true, it was barely light enough to see the sights; but then the deer was not over forty yards from me, and I could make allowance for that distance. Not the least excitement about me, the heart beat all right, the nerves were steady from the cup of strong coffee, and the stock and barrel of the rifle were held as steady as in a vise. I thought the eye was too good a target for the deer's light, and I had better unjoin the neck bone, just back of the head, as he was presenting a side shot to me, the high log covering all the body from sight.

The shot was made, and when the smoke blew to one side I saw a deer bounding off, making high jumps and whistling as he went. He did not go fast, and before he got a hundred yards he turned around, stamped the ground as if in regard, and acted very strangely for a deer that had been shot at. I quietly stepped down, and getting my cigar, which was alive, loaded my rifle and cautiously went up the bank and peeped over again. There was that huge buck still in sight and whistling and snorting, but further off, not less than 150 yards. Putting down the cigar on the top of the bank, I raised the rifle and fired with a rising aim as it came to the shoulder. The deer presented a beautiful side shot, I aimed just behind the head, and oh! how good I was when I saw him spring from the ground and then pitch over on his head. My esteemed young friend, Joe Mason, had won his bet. First giving the cigar a few long whiffs, I seized my horn and blew three long blasts as heartily as I ever did on any occasion. I had to blow a good many times before Dinkrave, with Tom Scarborough and James McEnery, came to my assistance with two horses. Hearing his shots, Henry Dinkrave insisted on taking two, as he asserted he was confident I had killed two deer, predicated on the premises that I did not miss when I had a fair shot.

When the three arrived I am very certain three weaker-kneed hunters never assembled around a big deer with the intention of putting him on a horse's back. They were not drunk, but in the most agreeable state of "tightness," in the best of humors with themselves and everybody else, and so, out of it while night's carousal, they did not collectively possess the power of lifting a deer.

I had cut the throat of the deer and was seated upon his head quietly enjoying my smoke when my friends came up. They were much surprised at his great size and his being so fat, and so dark a blue in color. His antlers had six points on one horn, and five on the other, being very wide set and remarkably keen pointed. Mr. McEnery remarked that "Joe Mason (his brother-in-law) should take them to Charlie Austin as Joe had won the bet. I wanted to cut the deer's head off and take out the entrails in order to render it easy to put him on the horse. This Tom Scarborough and Dinkrave objected to, as they wanted to take him just as he was to Charlie's for a show, and to win a champagne supper on his weight. It was the most awkward squad I ever saw undertake to get a big buck on a horse. When not under the influence of such a night's frolic, I have seen Henry Dinkrave take up such a deer and put him behind a riding easily as I would a small dog. Now, all three failed to do it, until after many an effort, my part being that of holding the horse and keeping him steady. Finally they succeeded and we started back. When we got opposite to where I first shot at the deer, looking over the big log, I asked Tom Scarborough to ride to it and look to see if there was not a dead deer there, telling them what a pretty shot I had and how steady I was to have missed that deer.

"Hold, Scarborough," said Henry, "I'll wager an oyster supper to-night for the crowd there is a dead deer behind that log."

"I'll take a half interest in it," said McEnery.

"And I won't risk a cent," said Tom.

"Well, I'll give the supper if there is one," said I.

Mr. Scarborough rode out to it, and then shouted for us to come and see the largest and fastest buck he ever saw. Sure enough, I had made a center shot, and struck him precisely where I aimed. The second deer must have been either lying down, or, if standing by the side of this one, was concealed by his greater size. The sudden death of his

companion, and not seeing any one, caused him to net as he did, and lead to his own death.

"Now we are in a fix," said Mr. Henry Dinkrave. "Let us all blow our horns and get the others to come. If we had as much trouble to get that buck on the horse, what will it be to put this one on that much larger one?"

The proposition was agreed to, the horns blown, and not being answered at the camp, I proposed to ride to it, and get the rest, for if either of the others should go, they would consider it only a ruse to get them to come. This was agreed to. I had not gone fifty yards before Dinkrave shouted, "Be sure to bring the negroes and the demi-john."

The camp was reached. The rest informed of the success and wants, and taking one negro man, we all started back.

I shall never forget Charlie Phillips' hearty oath of admiration, (and he could swear with more emphasis than any one I ever heard) when he examined that buck.

Dinkrave proposed that I should drive for them, as I had my share of the sport, and it was unanimously resolved that I should not be allowed to take my Greener lamint double-barrel shotgun. Henry remarked "It would be a most accident if I got a shot with a rifle, and he did I propose I should have another chance that day. With the aid of the negro man, who was quite sober, the buck was lashed on the saddle and we went back. Mr. Joe Mason telling Mr. Phillips he would have enough champagne to drink at his expense for a couple of months. Breakfast was ready when we got back to camp. I had a vigorous appetite and laid in a goodly supply of catables, and had a lunch put up, as I expected to make repeated drives in the Horseshoe until all the deer were driven out, and it would be time to return to Monroe.

Mounting my horse, and securing my rifle, with partition instructions from Dinkrave how to drive, I blew my horn and dashed into the drive. The hounds struck a trail within sixty yards of camp, where the deer had been as far as a drop of the second bottom, and seeing our camp-fires afraid to venture down, they stood at home, waiting the word of the horse before the dogs would unpick deer. In ten minutes began the skirmish firing. Standers had been posted about forty yards apart, from north end of the heel to the south, a distance, as before mentioned, of some two hundred yards. The one at the outer stand being Phillips, and at the lowest stand was placed Ludeling, the other four gentlemen respectively filling the intermediate distances. It had been agreed upon to shoot at the heels of the deer, and to hunt down the double report from McEnery's gun followed, and still no flagging of the terror-stricken animal. Then boomed the barrels of Joe Mason without a halt, when the last shot had to be made by Mr. Ludeling. Adjusting his gold glasses to take a better sight, as the deer passed broadside about twenty-five yards, mechanically he shut both eyes after seeing which way the animal was running, pressed both triggers at once, and then came a tremendous report, a double shot, and then behind for Joe Mason with the loads from Ludeling's gun and replaced them with double charges of powder and shot. Down went that unfortunate deer as dead a shot as ever was made, only one shot striking, and down went Mr. Ludeling on his back.

The dogs ceased running after the last shot, and I came out as fast as possible to ascertain the kill, fully expecting to find not less than a half dozen dead deer after twelve successful heavy gun shots. All were in a merry glee and bent upon giving Ludeling a good bloodying, according to hunters' usages, as this was his first deer; while he was contending most strenuously in arguing he had gotten enough by that joke of Mason's, as his face and shoulders would not get over it for a month of Sundays.

Toddies and cigars were distributed, and I went back into the drive, to see if I had seen any other deer. Besides this one, in a very little while the dogs started again. The deer were rather afraid to go out at the same place, and doubled around the whole drive a time or two before they made the leap down the fatal bank. Five double shots were fired, and when I came out again I found four more had been killed. Phillips, Scarborough, McEnery and Mason each bagging a deer—three pretty good-sized bucks and one stout doe. Dinkrave did not get a shot.

I came out this time, I saw quite a number of deer dashing back, with no dogs after them. This I told the hunters, and advised them to keep a sharp lookout, as I felt sanguine of running out quite a herd of deer the next time. Taking the dogs back under the bank of the lake until I reached the center of the Shoe, I rode up the bank and the pack burst into full cry. I had been very quiet in driving, not hallooing to the dogs, and endeavoring to get a shot myself. The game was so thick that, though within the bushes, I came within twenty or thirty steps, yet I could not get a shot with a rifle. The herd of deer made a straight run for the standers, not doubling any. Again came the booms of all the guns, everyone getting in both barrels. Dinkrave killed two fine bucks, Phillips killed a doe, McEnery bagged one, and the other gentlemen all had a hand in killing a fawn of one summer.

To my regret I heard the whole pack coming back, and straight to me. I was riding up a persimmon slough that was open sufficient to get a shot. Quickly I discovered the horns of two bucks I mounded over the bushes, and just about to get into the head of the slough, where I had stopped my horse. I was waiting for them to come as near as possible before shooting. The hounds being so close upon me, I knew I would have no opportunity to get a standing shot, and if I got one at all, it would be running by in the bushes, as among the persimmon saplings. Just when they had gotten to the place I wanted to fire, a breeze blew from me to the deer, and instantly the foremost sprang into the high cane, and as the other attempted the same movement I pulled down on him, and was so fortunate as to break his back. This was the smaller of the two. The dogs bit it for a while, until I succeeded in cutting his throat, when all my efforts were unavailing to keep them from following the deer. I had heard him bark, and I knew he was running, and I did not wish the dogs to follow for fear of the alligators. Deer and dogs all crossed without being attacked, and I seated myself on the bank to blow my horn, with a

## ROUGHING IT AFTER BLACK DRUM.

ON THE BAY SIDE, CAPE MAY, SHORE.

Editor Forest and Stream:

James K. Polk Schellenger sent me a telegram Friday, which read: "Cape May, N. J., June 18. Black drum biting like thunder on the Bay side, come now." Knowing J. K. P. Schellenger and his companion in piscatorial, Charley Stratton, of Cold Spring, to be veteran fishermen, and to be better posted than any two men on the island, in the habits and habitats of the red or black drum, I hastened to pack the biggest valise I had for the 8:30 P. M. train for Cape May.

In vain did my brilliant and agreeable friend and son of Esculapius, Dr. H. Gené Taylors, warn me that I had only been a week out of bed with the worst attack of "the stranger's fever," as it strikes the average incautious man in South Carolina, that I ever had, and was still on a diet of beef tea and boiled milk.

"Well, Doctor," I sadly replied, "you know what the fascinating Dr. Pepper, of Philadelphia, told me. 'If you hadn't been made of iron you would have been dead ten years ago.' 'Go I will,' I added. 'If politics in a quarter of a century has not caused me to pass in the ivory,' ten days drum-fishing won't do that thing." Crider, of Philadelphia, had rigged my drum lines with a copper wire, three inches in length, soldered to the hook; but while it gives security, the copper wire is too heavy, and don't let the clam bait float freely enough, as it does with an ordinary sinker only. As at present advised, I prefer the old style Cuttyhunk line, an ordinary "sheephead line."

While the black drum is game enough, as I found out Saturday, the copper wire is needed only for red drum, for in fishing in September for these with my gentle friend, Spicer Leaming, I always lost three where I "bag" one. Judge Miller (W. J. G. P. Society), says the word "bag" will not be properly applied to catching fish, but only to feathered game. Well, I only know the inimitable Col. Lansing sewed up my eighty-pound drum in a "bag" and I took it home. So I will inform the judicial mind (of the W. J. G. P. S.) if that isn't "bagging" a fish, and a big fish, then the malaria has weakened my intellect, which is barely possible; for, frankly, I have my opinion of a man (even J. M. S.), my best and earliest friend, who will spend five hours and a half in cockle shells, in the face of a strong northwesterly wind in order to catch three drum.

A Cumberland lawyer cheered up my expectant heart, on my arrival at Cape May, by telling me how, at Pierce's Point, near Cape May, he caught a sixty-pound black drum last week, on a rod and reel, with a blue or weakfish line. My friend Boyd is as modest as a woman, and the law and the rod and gun are his forte, while a love of notoriety constitutes his *piu*.

But it warmed my blood in all my veins to hear him tell of his triumph, which is something I never heard of before, and it was done. It argued that drum could be caught *ex improbo*.

I said to that imperturbable old sailor and fisherman, Jas. Knox Polk Schellenger, "I want to go by daylight, I came here for drum." It is not the "ear-piercing fire" I wish to hear (the G. A. R. were parading), it is the "drum/salams" I seek, with a "hook."

"Well, now, stranger," said J. K. P. S., putting a quarter of a pound of navy tobacco in his mouth. "Go a trifle slow."

"Dozen my skin, do you suppose me an' Charley Stratton don't know when these 'ere animals bite?"

I yielded gracefully to the superior intelligence of J. K. Polk Schellenger, who is as good a sailor and as brave and lucky a fisherman as ever sailed the ocean blue. He has enough of the dare-devil spirit in him to make him interesting and decidedly compensable. He called for me at noon and we drove up to Cold Spring, three miles from Cape Island, behind the young fisherman's last gray trotter. We found Stratton with a good sized anchor over his shoulder, near the water, at the bay side, eager for the fray with the big fish!

Stratton reminded me of the apostle Paul in one thing. He had that generally battered appearance (always becoming to your true friend) that "Hostetler's bitters" was produced, and means "game" and thought he must have been forty times shipwrecked and in perils off by land and sea, as Paul was.

But very quickly the little boat was bailed out. I was seated in the stern; overcoat on; for the southwest wind was high and threatening.

But we had come for big drum.

With two pairs of oars, two smart arms the three miles up the bay—we were compelled to row to reach the drumming grounds—were soon past, and Stratton threw out the anchor in the likeliest-looking spot close to the bar, but out in deep water. We could hear the sepulchral sound of an occasional drum, under water, which was merely a prolongation of the word "D-r-u-m." Imaginative fishermen say it is the love call of the male for the female.

All eyes, my friend, were turned over the stern at sharp 2 P. M. 8:30 P. M., not a bite, and the wind blew and the storm beat on that tiny little boat, a mile from shore. I looked at the weather-beaten but most genial face of C. Stratton. He looked more than hopeful as he handled his line, dyed with peach leaves so as to make it look more like the eel's skin waves.

"Anything to eat?" I said to Stratton, very dolefully, for in my eagerness, my slender live pounder, I had forgotten both Lullaby's precepts for the *cheval d'at* *debut*.

"Eat," repeated the solemn Stratton, "when we rough it on the bay for drum, 'Polky' and I feed on tobacco. We don't think of eating." My heart sank to the depth of the fishing banks, twelve fathoms at least.

Finally, after much keel-hauling in the stern, a small bottle (half pint) of "Hostetler's bitters" was produced, and one pound of oyster crackers, and one-fourth of a pound of cheese. In silence and in fear of a rebellious stomach, I made wild havoc with the cheese, and took a sip of bitters to wash down the skippers. It tasted worse to me than Dr. Pepper's latest prescription for the "malaria kakexia"—quinine dashed with strychnia. Better "revels dashed with wine," said I, quoting Lullaby.
